AUTHOR	Goldman, Vivian S., Ed.; And Others
TITLE	Research Relating to Children. Bulletins No. 16-23, July 1962-August 1968.
INSTITUTION	Children's Bureau (DHEW), Washington, D.C. Clearinghouse for Research in Child Life.
REPORT NO	ISSN-0080-1704
PUB DATE	68
NOTE	1,472p.; The approximately annual issues of this serial have been entered into the ERIC database individually from number 24 to the present.
PUB TYPE	Reference Materials - Bibliographies (131) -- Collected Works - Serials (022)
JOURNAL CIT	Research Relating To Children; n16-23 Jul 1962-Aug 1968
EDRS PRICE	MF12/PC59 Plus Postage.
DESCRIPTORS	Abstracts; Adjustment (to Environment); Annotated Bibliographies; *Child Development; Children; *Disabilities; Elementary Secondary Education; Emotional Disturbances; *Family Relationship; *Gifted; Individual Development; Intelligence; Language Acquisition; Learning Processes; Longitudinal Studies; Personality; *Personality Development; Personality Problems; *Research Projects; Social Behavior; Special Education
IDENTIFIERS	Childrens Bureau; Clearinghouse for Research in Child Life; Special Needs Children

ABSTRACT

This group of eight bulletins provides abstracts on research relating to children reported to the Clearinghouse for Research in Child Life from July 1962 to August 1968. Abstracts are organized by topic area: (1) "Long Term Research"; (2) "Growth and Development," including general, physical, perceptual, cognitive, motor, communication, learning, intelligence, and social development; (3) "Personality and Adjustment," including assessment, processes and factors, emotional and personality disturbances, and delinquency; (4) "Educational Process," including general, achievement, aptitude, school adjustment, specific skills, and special education; (5) "Exceptional Children," including gifted, retarded, and physically handicapped; (6) "The Child in the Family," including family background and child-rearing attitudes and practices; (7) "Social, Economic, and Cultural Influences"; (8) "Health Services and Surveys"; and (9) "Social Services." Each abstract presents the study's purpose, subjects, methods, findings, duration, investigator(s), cooperating group(s), and publication information. The abstracts are indexed by Organization Name, Investigator Name, and Topic Area to facilitate searching. The Bulletin's Research Notes section lists current funding opportunities, research organizations, and additional publications. Issues also include a list of other abstracting journals and services. FOREWORD

This Bulletin like previous issues, includes reports of research in progress or research very recently completed. It does not report again studies included in Bulletin 3 through 15 even though they are still continuing. This issue, therefore, does not reflect all research relating to children in a given period but only that which was first reported to the Clearinghouse July 1, 1962 through January 31, 1963.

The Clearinghouse has only such information about the research projects as the abstracts provide. Publication references and plans are given for some of the projects, but the Clearinghouse cannot attempt to keep track of the final publication of the studies. The reader who wishes to obtain further information about any of the projects reported should write directly to the investigator or check professional journals in the appropriate field.

For the Clearinghouse, I wish to thank those who have submitted reports and to acknowledge the valuable assistance of the National Council on Crime and Delinquency, the Science Information Exchange of the Smithsonian Institution, the Clearinghouse on Morbidity Statistics Projects of the U. S. Public Health Service, and the several foundations which provide us with information about recent research grants.

To Research Investigators:

This publication is only as complete as you are willing to make it. Page 143 is a form for letting us know of other investigators who are working in the field. Page 145 is a form for reporting your own current research. Please let us hear from you.

Clearinghouse for Research in Child Life

8

LONG-TERM RESEARCH

Note: The reports in this section concern research programs which are more or less continuous.

16-A-1 GROWTH, DEVELOPMENT, AND ADAPTATION OF HUMAN INDIVIDUALS

Purpose: To gain greater understanding of many factors involved, prenatal and postnatal, as an individual is in the process of becoming the kind of a person he is as an adult.

Subjects: Approximately 100 middle class families in Denver, Colorado, including 185 offspring of whom 41 are second generation followed in the institute. (80 percent of subjects entered since 1930 are still being followed.)

Methods: Each subject followed from birth at regular intervals studying: (1) pattern of changing structure by direct measurements, X-rays, and photographs; (2) development of personality traits, starting with family during prenatal period and carried on intensively with infant and child; (3) patterns of physiological development including nutrition, biochemical and physiological tests, and evaluation of healthiness.

Publication references: Appropriate medical or scientific journals every year. Publication lists available.

Initiation date: 1927.

Principal investigator: Robert W. McCammon, M.D., Director, Child Research Council, University of Colorado, 4200 E. Ninth Ave., Denver 20, Colo.

Cooperating groups: University of Colorado; Commonwealth Fund; Field Foundation; National Association for Mental Health; Nutrition Foundation; National Live Stock and Meat Board; Gerber Baby Foods Fund; Lawrence Phipps Foundation; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-A-2 ANALYSIS AND EVALUATION OF DATA FROM THE LONGITUDINAL STUDY OF CHILD HEALTH AND DEVELOPMENT BASED UPON MULTIDISCIPLINE AND PERIODIC OBSERVATIONS OF INDIVIDUAL CHILDREN FROM BIRTH TO 18 YEARS

Initiation date: 1930.
Principal investigator: Research has been discontinued but the analyses of data and preparation of reports are being continued by individuals under the direction of Robert B. Reed, Ph.D., Professor of Biostatistics, Harvard School of Public Health, 55 Shattuck St., Boston 15, Mass.

16-A-3 LONGITUDINAL STUDY OF CHILD GROWTH AND DEVELOPMENT

Purpose: Program consists of study of adult personality, adjustment and aging processes of individuals whose health, growth, personality development, and environment have been studied since birth. It included a study of the aging processes of their parents in relation to physical and biochemical measures made earlier. It will include studies of: parental child-rearing attitudes and practices of two generations in the same families; constancy of autonomic response patterns to stress from childhood to young adulthood and their relationship to psychosomatic disorders in adulthood; blood lipids in relationship to body composition and change in composition.
Principal investigator: Lester W. Sontag, M.D., Director, Fels Research Institute for the Study of Human Development, Antioch College, Yellow Springs, Ohio.
Cooperating group: Public Health Service, U. S. Department of Health, Education, and Welfare.

16-A-4 THE BERKELEY (CALIFORNIA) GROWTH STUDY

Purpose: A study of the mental and physical growth of approximately 50 normally healthy persons from birth in 1928-29 to the present (32 years).
Subjects: Full term, healthy newborns, born in Berkeley, California, hospitals of white, English-speaking parents, if parents were interested--a somewhat selected above average group. 50 offspring of these subjects, age range from a few months to about 13 years, seen irregularly, but the same data (appropriate for age) are collected that were collected for their parents.
Methods: Tests of mental and motor development; pediatric examination; interviews at frequent intervals during growth beginning in first week of life. At all visits, inquiries made concerning current health and recent illnesses. Anthropometrics, body photographs and skeletal X-rays taken at most ages. Socio-economic data available. Comparisons now being made on variety of collected data. Studies of physical aspects of children's growth include analyses comparing health histories with physical growth and with skeletal maturation. Some parent-child relations in susceptibility to illness could be studied. Emotional and other personality variables studied for consistency, and in various interrelations with maternal behavior in infancy, birth histories, socio-economic status, intellectual and physical growth.
Publication references: Studies in the Development of Young Children, University of California Press, 1940. Growth Diagnosis, University of Chicago Press, 1959. Child Development 12:167-173, 1941; 27:45-74, 1956. American Psychologist 10:805-818, 1955. Others in Journal of Pediatrics, Child Development, and psychological journals.
Initiation date: 1928.
Principal investigators: Nancy Bayley, Ph.D., Chief, Section on Child Development, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington, D. C.; Mrs. Dorothy H. Eichorn, Ph.D., Associate Research Psychologist, Institute of Human Development, University of California, Berkeley, Calif.
Cooperating group: Institute of Human Development, University of California.

BEST COPY AVAILABLE

16-A-5 NUTRITION AND CHEMICAL GROWTH IN CHILDHOOD

Purpose: To investigate body composition during childhood, mineral metabolism in childhood in relation to growth, maturation, and density of bones.

Publication references: Nutrition and Chemical Growth in Childhood, Vols. I-III, Charles C. Thomas. Human Biology, September 1946. Book, University of Chicago Press, 1956-57. Some papers will be published in scientific journals.

Initiation date: 1930.

Principal investigator: Icie Macy Hoobler, Ph.D., Sc.D., Consultant, Merrill-Palmer Institute, Detroit, Mich.

Cooperating groups: Kresge Foundation; Nutrition Foundation; Swift and Company Foundation; Williams-Waterman Foundation; Public Health Service, U. S. Department of Health, Education, and Welfare.

16-A-6 INSTITUTE FOR CHILD STUDY OF PHILADELPHIA

Purpose: To develop standards and norms of physical growth, specific for children of urban Philadelphia. Longitudinal study based on annual or semiannual follow-up of more than 2,000 children registered at the Institute.

Methods: School Series: initially based on 600 school children in 5 schools (now 22 schools), ages 6-12, "normal" medically and dentally; data collected on national and ethnic background, socio-economic status of parents, medical and dental health history of child, height and weight of parents and siblings, anthropometric measurements and X-rays.

American Negro Series: 150 Negro children with normal occlusion selected to study with a view to establishing tentative standards of facial growth.

Pilot Study Series: extensive study of 75 children, 6 to 8 years of age, seen every three months for measurements, X-rays, dietetic histories, careful medical examination data, blood chemistry, oral pathology data, etc.

Orthodontic Series: all children accepted by Orthodontic Clinic had lateral and postero-anterior head films taken and detailed measurements of head and face made.

Orthodontic Treatment Series: a small pilot study of 15 white boys, age 11 to 15, with a certain type of malocclusion accompanied by V-shaped, high-vaulted palate; 15 with identical orthodontic condition; 15 with normal occlusion--first group to receive free orthodontic care, second and third groups to receive free dental care but no orthodontic treatment.

Cleft Palate Series: growth pattern of 250 children with cleft lip and/or palate.

Cooley's Anemia Series: family-line investigation of 25 children for traits other than the disease such as facio-dental growth dysplasia.

Endocrine Series: evaluation of degree of growth deviation with follow-up to study effect of endocrine therapy upon growth pattern.

Behavioral Series: 110 first, second, and third graders rated in terms of physical growth progress and simultaneously in terms of grades, emotional stability, and other aspects of classroom behavior to see if there is any real correlation.

Initiation date: 1947.

Principal investigator: Wilton M. Krogman, Ph.D., Director, Institute for Child Study of Philadelphia, Philadelphia, Pa.

Cooperating groups: Institute for Child Study of Philadelphia (sponsored by Graduate School of Medicine and Evans Institute of Dentistry of University of Pennsylvania and Children's Hospital of Philadelphia); Philadelphia Department of Public Health; Philadelphia Board of Public Education; Public Health Service, U. S. Department of Health, Education, and Welfare.

16-A-7 LONGITUDINAL STUDY OF DENTOFACIAL, SKELETAL, PHYSICAL GROWTH AND NUTRITION OF CHILDREN

Purpose: To study the dentofacial growth of children, standards of nutrition, caries increment as related to nutrition, assessment and skeletal age as related to facial growth, variations in physique and its effect on dentofacial growth. Twins are also being studied to determine heritable traits.

Subjects: 400 children, including 40 pairs of twins, ages 3 to 18 years, who have been observed for periods of 3 to 10 years.
Methods: Cephalograms, hand, wrist, and calf X-rays, intra-oral X-rays, study casts, anthropometric measurements, photographs, oral examination, and one-week food diary. Children are examined every six months until 14 years of age.
Publication references: Recent articles: Radiology, April 1961; July 1962; Journal of Dental Research, July-August 1961; July-August 1962. Human Biology, February and September 1962.
Initiation date: 1950.
Principal investigator: Bhim S. Savara, D.M.D., M.S., Professor and Head, Child Study Clinic, University of Oregon Dental School, 611 S.W. Campus Dr., Portland 1, Oreg.
Cooperating groups: University of Oregon Dental School; Oregon State Board of Dental Examiners; Tektronix Foundation, Inc.; Medical Research Foundation of Oregon; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-A-8 RADIOGRAPHIC ATLASES OF SKELETAL DEVELOPMENT

Purpose: To develop radiographic standards of skeletal development for use as reference standards for children.
Subjects: 4483 Cleveland children; 134 Boston children.
Methods: Series of films of hand, elbow, shoulder, hip, knee, and foot of healthy children are used to identify the modal (moderate) rate of bone development. Revisions or initial standards are prepared as needed to provide standards of reference.
Publication references: Current standards: Radiographic Atlas of Skeletal Development of Elbow and Shoulder; Radiographic Atlas of Skeletal Development of Hip. The latest standard for the hand was published in 1959; foot in 1962; and knee in 1955.
Duration: 1948-1964.
Principal investigators: S. Idell Pyle, Ph.D., Research Associate, Department of Anatomy, Western Reserve University, Cleveland, Ohio; and William Walter Greulich, Ph.D., Professor and Head, Department of Anatomy, Stanford University, Stanford, Calif.
Cooperating groups: Bolton Study (Cleveland); Department of Maternal and Child Health, Harvard University School of Public Health.

16-A-9 COLLABORATIVE STUDIES IN CEREBRAL PALSY AND OTHER NEUROLOGICAL AND SENSORY DISORDERS OF INFANCY AND CHILDHOOD

Purpose: To investigate factors and conditions affecting parents: (1) conditions of pregnancy itself, such as infections, trauma, bleeding, drugs, and progress of labor; (2) environmental factors influencing mother, such as social and economic conditions, emotional stress, and medical care; (3) biological factors in parents such as age, parity, medical and reproductive history, and immunologic characteristics; (4) genetic background of parents. To investigate in the offspring: disorders of the nervous system of all products of conception at time of delivery or appearing during infancy or early childhood, including cerebral palsy, mental subnormality, behavioral disorders, etc. A detailed investigation of the independent variables will be directed toward the re-evaluation of the effect of factors already suspected, the elucidation of the mechanism through which these factors are operative, and the discovery of factors neither presently known nor suspected.
Subjects: Approximately 8,000 live births per year from 16 collaborating institutions for five years. Offspring followed until school age.
Methods: Analysis of pooled information collected in a uniform way in a number of medical centers throughout the country from women studied during pregnancy and from their offspring followed throughout infancy and early childhood. Intensive study of limited number of cases; less intensive study of as many damaged children and abnormal pregnancies as possible.
Publication references: Johns Hopkins Magazine, June 1959.
Initiation date: 1956.
Principal investigators: Richard L. Masland, M.D., Coordinator of Project, National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education,

and Welfare, Washington, D. C. Collaborating institutions: Children's Hospital, San Francisco, Calif.; Yale University School of Medicine, New Haven, Conn.; Charity Hospital, New Orleans, La.; Johns Hopkins University School of Medicine, Baltimore, Md.; Boston Lying-In Hospital and Children's Medical Center, Boston, Mass.; University of Minnesota Medical School, Minneapolis, Minn.; Columbia-Presbyterian Medical Center and New York Medical College, New York, N. Y.; University of Buffalo, Buffalo, N. Y.; University of Oregon Medical School, Portland, Oreg.; Children's Hospital of Philadelphia and Pennsylvania Hospital, Philadelphia, Pa.; Brown University, Providence, R. I.; University of Tennessee Medical School, Memphis, Tenn.; Medical College of Virginia, Richmond, Va.

16-A-10 RESEARCH ON SPEECH AND LANGUAGE DISORDERS

Purpose: To investigate etiology, prevention, and rehabilitation in speech and language disorders of children with cerebral palsy, aphasia, cleft palate, endocrine disorders, Mongolism, or mental deficiency.
Subjects: Study group chosen from clinical population, approximately 1,500 cases, and matched with normal controls.
Methods: Basic studies on anatomy and functional laryngx, respiration, etc., including X-ray measurements and similar techniques; various other research methods (generally behavioral items) depending upon area under study.
Publication references: Articles appearing regularly in Journal of Speech and Hearing Disorders, Journal of Speech and Hearing Research, Cerebral Palsy Review, etc.
Initiation date: 1934.
Principal investigator: Martin F. Palmer, Sc.D., Director, Institute of Logopedics, 2400 Jardine Dr., Wichita 19, Kans.
Cooperating group: Federally supported.

16-A-11 METHODS IN CHARACTER DEVELOPMENT

Purpose: To develop more effective methods in character development in cooperation with character training agencies.
Subjects: Children and families in about 30 participating church schools and other groups widely spread in the United States.
Methods: Experimental use of curriculum by participants. Reports of experimental efforts analyzed and curriculum revised on basis of findings. Methods of character education then developed and reported. Emphasis is on character growth in children.
Findings: Anticipate development of instructions for writing character building curricula. These will include types of homes, children, and classes for character development and descriptions of age-level potentials for children.
Publication references: Published in Union College Studies in Character Research. Also Dimensions of Character, Macmillan, 1956.
Initiation date: 1936.
Principal investigator: Ernest M. Ligon, Ph.D., Director, Character Research Project, Union College and University, Schenectady, N. Y.
Cooperating group: Lilly Endowment, Inc.

GROWTH AND DEVELOPMENT

General

16-B-1 ROLE OF NEONATAL CHARACTERISTICS IN LATER DEVELOPMENT

Purpose: This pilot study aims to prepare for a longitudinal investigation which is to explore the role neonatal modes of handling stimuli may have in adaptive or pathogenic development. Relevant problems for investigation are the relationship of such modes to defense choice; to cognitive style; and to the individual character in which a child will experience psychosexual and other maturational tasks. Specific aims of the pilot study are: (1) to try out methods of testing neonatal modes of handling stimuli which could also be applied to older children; and (2) to commence establishment of a baseline of neonatal differences in sensory sensitivity and reaction patterns.
Duration: November 1961-indefinite.
Principal investigator: Anneliese F. Korner, Ph.D., Senior Psychologist, Mt. Zion Hospital and Medical Center, 1600 Divisadero St., San Francisco 15, Calif.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Physical

16-C-1 INFANT FEEDING PATTERNS OF OVERWEIGHT AND UNDERWEIGHT CHILDREN

Purpose: To determine if there is any relationship between infant feeding patterns and subsequent body weight in childhood.
Subjects: Patients in a city health department nutrition clinic.
Methods: Overweight, underweight, and normal weight patients and their parents are interviewed concerning their infant feeding patterns.
Findings: Preliminary impression: no difference between overweight and underweight subjects in respect to infant feeding habits.
Publication plans: Pediatric journal publication planned.
Duration: 1957-1962.
Principal investigator: Robert W. Hillman, M.D., M.P.H., Professor, Department of Environmental Medicine and Community Health, State University of New York Downstate Medical Center, 450 Clarkson Ave., Brooklyn 3, N. Y.
Cooperating group: Bureau of Nutrition, New York City Department of Health.

16-C-2 FINGERNAIL GROWTH IN RELATION TO BODY GROWTH

Purpose: To determine if any correlation exists between fingernail growth rate and ratio of increase in height and weight.
Subjects: Patients, age 5 to 15, in a health department nutrition clinic.
Methods: Fingernail growth rates (for first and third digits) and body weight are measured at four-week intervals. Height is measured at six-month intervals (or less). Data are analyzed for possible relationship.
Publication plans: Probably in a pediatric journal.
Duration: 1962-1963.
Principal investigator: Robert W. Hillman, M.D., M.P.H., Professor, Department of Environmental Medicine and Community Health, State University of New York Downstate Medical Center, 450 Clarkson Ave., Brooklyn 3, N. Y.
Cooperating groups: Red Hook Health Center Nutrition Clinic, New York City Department of Health; Institute of Nutrition Services, Columbia University.

16-C-3 GROWTH AND DEVELOPMENT OF THE DENTURE OF "NORMAL" CHILDREN WITH "NORMAL" OCCLUSION

Purpose: To provide a baseline for comparison of growth study of handicapped children and of children with malocclusion.
Subjects: Patients with primary and/or mixed dentition showing normal occlusion applying for treatment in the pedodontic and orthodontic clinics.
Methods: Sites, direction, and amount of growth to be determined from yearly cephalometric roentgenographic tracings and study models.
Duration: September 1961-indefinite.
Principal investigator: Sidney Kronfeld, D.D.S., Associate Professor of Pedodontics, New York University College of Dentistry, New York, N. Y.

Perceptual, cognitive, and motor

16-D-1 DEVELOPMENTAL NORMS FOR CERTAIN AUDITORY TASKS

Purpose: To establish developmental norms for certain listening tasks in children from age 6 months to 54 months.
Subjects: Normal children, age 6 to 54 months.
Methods: Subjects participated in 11 listening tasks which ranged from awareness of auditory stimuli to differential and sequential response to sound. Norms by age were established.
Publication plans: Publication is planned within the next few months.
Duration: February 1960-March 1963.
Principal investigators: Vincent H. Knauf, Ph.D., Audiologist, Indiana University, Bloomington, Ind.; John V. Irwin, Ph.D., Professor of Speech and Director, Speech and Hearing Clinics, and Claude S. Hayes, Ph.D., Associate Professor of Speech, University of Wisconsin, Madison, Wis.

16-D-2 CHILDREN'S RESPONSES TO NOVEL AND COMPLEX STIMULI

Purpose: To determine whether, under specified experimental conditions, children and infants prefer novelty to familiarity and complexity to simplicity; also, to determine if exposure to novel and complex stimulation arouses drive states in such subjects.
Subjects: Infants two to four months and six to eight months; preschool children three to five years; elementary school children, fourth and fifth graders; kindergarten children.
Methods: Preliminary work (two completed studies) has demonstrated a preference in preschool children for complexity as opposed to simplicity of visual stimulation and a preference in kindergarten children for novel as opposed to familiar visual stimulation.
Publication references and plans: The complexity study is in press in Child Development; the novelty study has been submitted to Child Development; about six future studies in this project will be submitted to appropriate psychological or child development journals if they are considered publishable.
Duration: September 1961-September 1964.
Principal investigators: Gordon N. Cantor, Ph.D., Associate Professor of Child Psychology, and Joan H. Cantor, Ph.D., Iowa Child Welfare Research Station, State University of Iowa, Iowa City, Iowa.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-D-3 RELATIONSHIPS AMONG MEASURES OF VISUAL PERCEPTION AND HYPERACTIVITY IN ELEMENTARY SCHOOL CHILDREN

Purpose: To determine relationships among measures of visual perception and hyperactivity in elementary school children including those referred with special problems. A number of tests of visual perception are available. These have shown promise in detecting organicity. Hyperactivity is believed to be one of the major concomitants of brain injury that must be delt with in school programming. Research is an attempt to circumvent many of the problems associated with the concept of brain injury by focusing on hyperactivity of children.
Subjects: Approximately 125 subjects from elementary school classes.
Methods: A detailed rating schedule will be selected to measure hyperactivity. Separate laboratory procedures to measure the major characteristics of hyperactivity as reported in the literature will be selected. The more promising tests of visual perception (including Syracuse Visual Test, Ellis Designs, Marbleboard Test, and Graman-Kendal Test) will be used. Relationships among measures of hyperactivity and measures of visual perception will be determined.
Duration: August 1962-July 1964.
Principal investigators: Matthew J. Trippe, Ph.D., Associate Professor of Special Education Bobby E. Palk, Instructor, Department of Special Education, and Sadye Tune Brooks, Ph.D., Research Associate, George Peabody College for Teachers, Nashville 5, Tenn.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-D-4 THE PROCESS OF ADAPTATION IN THE HUMAN INFANT IN THE FIRST SIX MONTHS OF LIFE

Purpose: To use controlled observations and experimental techniques to explore the question of how sensory-motor abilities are mastered during the infant's day-by-day transactions with his environment in the first six months of life. Previous results of studies by R. Held and others with animals and adult humans suggest that visual-motor development depends upon self-induced movements in dependable, stimulus-rich environments. In addition, they have identified some of the components of movement required for adaptation and development. Still other studies have revealed some of the interrelationships between systems of coordination such as prehension and egocentric localization. It is planned to test the relevance of the findings to the early development of infants.
Subjects: Institutionally-reared infants to be studied are kept in circumstances which, according to our laboratory findings, tend to impede their sensory-motor development. Their visual surrounds are impoverished and their movements limited.
Methods: Institution of procedures designed to enhance the development of various sensory-motor capacities and to test the validity of theoretical views. Furthermore, it is hoped to evaluate the views of H. Hartman on "Conflict-Free Ego Functions," R. W. White on "Competence Motivation," and J. Piaget on "Intellectual Development" in the light of our findings.
Duration: 1962-1967.
Principal investigators: Burton L. White, Ph.D., Research Associate, Richard M. Held, Ph.D., Chairman, and Michael Breen, Graduate Student, Department of Psychology, Brandeis University, Waltham, Mass.; Peter H. Wolff, M.D., Consultant, Judge Baker Child Guidance Clinic, Boston, Mass.
Cooperating group: Foundations' Fund for Research in Psychiatry.

16-D-5 MOTOR LEARNING AND PERFORMANCE RELATED TO AGE AND SEX

Purpose: To determine the influence of age and sex on amount and rate of motor learning. This includes a determination of whether the exponential theory of progress of learning is applicable to motor performance. Study has taken the form of an investigation of learning of two or more large muscle motor skills. It is anticipated that data will be informative with respect to age and sex differences in standardized motor performance for a wide age range.
Subjects: 16 volunteer subjects of each sex at each age from 6 to 60 will be tested on several motor learning tasks, unselected insofar as factors which might be expected to influence motor performance are concerned.

Methods: At present, two tasks appear to be usable to fulfill the experimental requirements and others will be sought. One task is learning to balance on a horizontally pivoted platform (stabilometer). This problem has produced large amounts of learning within about 20 minutes in all age groups and in both sexes. Another task involves climbing a short unsupported vertical ladder as high as possible before it topples over. A pilot study using both apparatus with ages 6 through 60, of both sexes, indicated that the tasks could be done without difficulty and within a total time of about 45 minutes.
Publication references and plans: Findings of preliminary investigations have been reported in Research Quarterly, March and May 1961. Plan to publish findings of present study in Research Quarterly also.
Duration: Fall 1961-fall 1963.
Principal investigator: John C. Bachman, Ed.D., Assistant Professor, Chico State College, Chico, Calif.

16-D-6 PERCEPTUAL REINFORCEMENT IN COGNITIVE DEVELOPMENT OF INFANTS AND YOUNG CHILDREN

Purpose: To evaluate the role of behavior that generates information in and about the environment in the intellectual development of infants and young children.
Subjects: Normal and retarded children from early infancy to early elementary school level.
Methods: Laboratory methods of operant conditioning are adapted to provide experimental control over presentation of response opportunities and the information content of response-produced feedback while behavior as a dependent variable is recorded in quantized units.
Findings: Findings to date suggest that informational feedback sustains orderly response patterns at both infant and preschool age levels, and that response output varies as a function of informational content of feedback and reinforcement contingencies.
Publication references: American Psychologist 16:350, July 1961; 17:320, June 1962.
Duration: June 1960-continuing.
Principal investigators: Jane W. Kessler, Ph.D., Director, and Bernard Z. Friedlander, Ph.D., Postdoctoral Research Fellow, Mental Development Center, Western Reserve University, Cleveland 6, Ohio.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-D-7 COGNITIVE STUDIES IN NORMAL AND DISTURBED CHILDREN

Purpose: To study the role of intelligence in concept attainment and other cognitive functions and the role of emotional disturbance; to isolate variables involved in concept attainment.
Subjects: Children between 6 and 14 years old, normal and neurotic.
Publication references: American Journal of Psychology, 1960. Journal of Experimental Psychology, July 1961; June 1962.
Duration: 1958-not reported.
Principal investigator: Sonia F. Osler, Ph.D., Associate Professor of Medical Psychology and Pediatrics, Johns Hopkins School of Medicine, Baltimore 5, Md.
Cooperating groups: National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare; National Science Foundation.

Communication

16-E-1 ACQUISITION OF LANGUAGE

Purpose: To determine the language syntax of the child; its development, possible relation to syntax of adult language group; of mother's usages with child, etc.

Subjects: Children of graduate students and some staff; also children abroad in India, Germany, Hungary, etc.
Methods: Phonetic and nonphonetic time-sample transcriptions.
Publication plans: No publication plans formulated.
Duration: September 1962-indefinite.
Principal investigator: David Premack, Ph.D., Associate Professor, Department of Psychology, University of Missouri, Columbia, Mo.

16-E-2 CONTEXTUAL CONSTRAINTS IN THE LANGUAGE OF THE CHILD

Purpose: (1) To measure the amount of redundancy of children's written and spoken language, and of that written for and spoken to them; (2) using experimental material quantified with respect to redundancy or patterning, to determine its influence on learning, retention, comprehension, reading, and other language behavior; (3) based on the outcome of these experiments, to write one or more texts in which redundancy is well-defined. These constructed texts will be used in experiments with new groups of children to test the hypothesis that language development is fastest when optimal redundancy is built into the texts.
Methods: Samples of reading materials and spoken language will be collected that are appropriate to children in the second, fourth, and sixth grades. These samples will be quantified in terms of a measure of redundancy, and statistical comparisons will be made with similar measures obtained for adult language. Using these measures, learning materials will be constructed at five redundancy levels to investigate the influence of redundancy upon learning. A simple factorial analysis of variance design will permit a quantitative evaluation of the effect of the variables on the learning measure, including interactions and linearity.
Duration: October 1962-October 1964.
Principal investigators: Edward C. Carterette, Ph.D., Assistant Professor, Department of Psychology, and Margaret Hubbard Jones, Ph.D., Research Associate, Department of Psychology and College of Engineering, Univeristy of California, Los Angeles 24, Calif.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-E-3 SPEECH INACCURACY IN CHILDREN RELATED TO ETIOLOGY

Purpose: To explore the articulatory patterns of children diagnosed as showing articulatory inaccuracy because of varying etiological problems.
Methods: A dual-modality (visual and auditory) articulation test will be developed and standardized on five age groups (M.A.'s 5 to 10) of unselected children in urban schools who have adequate intelligence, auditory and visual acuity, and auditory discrimination. Three experimental groups falling in the same age range and diagnosed as falling into one of three etiology groups: (1) maturational; (2) retardation-intellectual; or (3) pathological-physical will be studied for intelligence, visual and auditory acuity and auditory discrimination as well as for articulatory inaccuracy. Speech profiles will be prepared for each child and compared with other children in their group and with the control group. Deviations for each child and group will be determined. By determining the differential response to the visual and auditory tests the modality of choice for each child will also be determined.
Duration: July 1961-July 1963.
Principal investigators: Joseph M. Wepman, Ph.D., Associate Professor of Surgery and Psychology, Paul Weiner, Ph.D., Lecturer in Psychology, and Anne Morency, Department of Education, University of Chicago, Chicago 37, Ill.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-E-4 A PREDICTIVE SCREENING TEST FOR CHILDREN WITH ARTICULATORY SPEECH DEFECTS

Purpose: To devise and cross-validate a predictive screening test which will distinguish those elementary school children who "outgrow" or overcome by themselves their articulatory speech defects without speech therapy from those who do not.

Subjects: Two groups of approximately 150 first grade school children with articulatory speech defects.
Methods: From a pool of test items having face validity in predicting self-mastery of articulatory errors as judged by 30 public school speech therapists or as so designated in the literature, an initial test battery will be devised. This test battery will be administered to children who will be retested after intervals of one or two years. Those items which differentiate between the children who have achieved normal speech without speech therapy and those who have not will be combined to form a new screening test. This screening test will then be administered to another group of approximately 150 new first grade children with articulatory defects to ascertain its predictive validity in differentiating those who overcome their errors without speech therapy after intervals of one and two years from those who do not.
Duration: February 1962-August 1966.
Principal investigator: C. Van Riper, Ph.D., Director, Speech and Hearing Clinic, Western Michigan University, Kalamazoo, Mich.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

Learning

16-F-1 VERBAL CONTROL OVER NONVERBAL BEHAVIOR

Purpose: General aim is to investigate the amount of control that can be obtained over a child's nonverbal behavior by operations upon his verbal behavior. Certain verbal behavior will be strengthened in children by experimental reinforcement. Resulting effects of these alterations upon their nonverbal behavior will be observed. Research will be done within a conceptual framework which considers interaction between verbal and nonverbal behavior as an interaction between two operants.
Methods: Research will adhere to a strict laboratory-experimental approach in which control can be achieved over the presentation of the stimulus events and the recording of the child's behavior. The experimental paradigm will follow intrasubject replication design.
Duration: September 1962-1965.
Principal investigator: O. Ivar Lovaas, Ph.D., Assistant Professor of Psychology, University of California, 405 Hilgard Ave., Los Angeles 24, Calif.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-F-2 RELATIVE PRESTIGE AND THE VERBAL CONDITIONING OF CHILDREN

Purpose: To study operant control of the verbal behavior of children.
Subjects: Fifth grade children in suburban Denver schools.
Methods: Operant conditioning.
Findings: Substantial control of the verbal behavior of children can be obtained under precise laboratory conditions.
Publication plans: Will submit to Journal of Experimental Analysis of Behavior.
Duration: March 1962-July 1963.
Principal investigator: Albert I. Prince, Ph.D., Assistant Professor of Psychology, University of Denver, Denver, Colo.

16-F-3 LEARNING AND RETENTION AS A FUNCTION OF TRIGRAM FREQUENCY, SEX, AND GRADE LEVEL

Purpose: To determine whether the sequential dependencies of language can be observed in children and, if these conditional probabilities are found, to investigate effects of high and low frequency sequences (trigrams) on learning and recall in children of various ages.

Subjects: Approximately 120 children of the University Elementary School from grades 1A, 2B, 3A, 4A, 5A, and 6A to gather normative data on trigrams; 61 children from grades 2, 4 and 6 in the learning and recall experiment.
Methods: Normative data were gathered by having children respond with a third letter after having read a digram. After frequencies of the various trigrams were collated, lists for the learning experiment were constructed. Three high and three low frequency words composed a list. The list was presented serially for learning to a criterion, and the order of the list was counterbalanced over subjects. Children were asked to recall the lists 24 hours later.
Findings: Results indicate that children not only give reliable sequences of letters, but that these sequences are consistent with sequences given by adults. Data show that as children progress through grade school they make fewer errors in learning, girls on the whole make fewer errors than boys, and high frequency trigrams are learned with fewer errors than low frequency trigrams. There were no differences found between types of trigrams in recall.
Publication plans: Journal of Verbal Learning and Verbal Behavior.
Duration: January 1962-June 1962.
Principal investigator: Dolores D. Kluppel, Ph.D., Assistant Professor of Psychology, University of California at Los Angeles, Los Angeles 24, Calif. (Reported by Wendell E. Jeffrey, Ph.D., Associate Professor of Psychology.)

16-F-4 CROSS-MODALITY STUDIES OF TRANSPOSITION IN CHILDREN

Purpose: Comparison of inter- and intramodal differences in learning and transposition in vision and audition with special attention to developmental questions.
Subjects: First, second, and fifth grade children; college students.
Methods: Experimental--discriminations are taught under various conditions; subjects are then tested for transposition in hue, brightness, pitch and loudness.
Publication references: Child Development; Journal of Comparative and Physiological Psychology.
Duration: 1959-1965.
Principal investigators: John P. McKee, Ph.D., and Donald A. Riley, Ph.D., Associate Professors of Psychology, University of California, Berkeley 4, Calif.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-F-5 INFLUENCE OF SPATIAL SEPARATION OF STIMULUS, RESPONSE AND REWARD ON DISCRIMINATION LEARNING IN YOUNG CHILDREN

Purpose: To evaluate the relative contribution of spatial separation of stimulus response and reinforcement in various combinations, on rate of discrimination learning.
Subjects: 60 nursery school children, 3 and 4 years of age.
Methods: Five groups at each age level were given a black-white discrimination task in a modified Wisconsin General Test Apparatus. Stimuli were presented so that (1) stimulus response and reinforcement were all together, or (2) reinforcement was presented eight inches away from the stimulus and response, or (3) response was eight inches away from the stimulus and reinforcement, or (4) stimulus was eight inches away from response and reinforcement, or (5) stimulus response and reinforcement were each separated by eight inches.
Findings: Only subjects in groups one and two learned the task indicating the importance of the response being spatially contiguous with the stimulus for easy learning in young children. There was also a significant age difference.
Publication plans: To be published in Journal of Comparative and Physiological Psychology or Journal of Experimental Psychology.
Duration: August 1962-December 1962.
Principal investigator: Wendell E. Jeffrey, Ph.D., Associate Professor of Psychology, University of California, Los Angeles 24, Calif.
Cooperating group: National Science Foundation.

BEST COPY AVAILABLE

16-F-6 DEVELOPMENT OF INCENTIVE VALUES IN CHILDHOOD

Purpose: (1) To compare values of material and verbal incentives in discrimination learning; (2) to evaluate paired comparisons as an incentive preference scale; and (3) to analyze age trends in incentive values between ages 6 and 10.

Subjects: 120 elementary school children--20 boys and 20 girls at each of grades one, three, and five.

Methods: Subjects will evaluate five incentive types by paired comparisons and via a five-choice Wisconsin General Test Apparatus discrimination problem. Incentives are bubble gum (edible), penny (token), charm (manipulatable), "better than before" (verbalism), and control. Reinforcements are presented simultaneously. Scores are incentive choices, not discrimination learning curves.

Duration: July 1962-August 1964.

Principal investigator: Sam L. Witryol, Ph.D., Professor of Psychology, University of Connecticut, Storrs, Conn.

Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-F-7 STIMULUS AMBIGUITY AND LEARNING SET AS A VARIABLE IN NONREVERSAL SHIFTS IN CHILDREN

Purpose: The Kendlers have reported a surprising amount of nonreversal shift-responding on the part of children as old as 10 years in a situation which permits an inference regarding the child's basis of responding on a test task as the result of two previous training situations.

Subjects: Children, aged 4, 5, 9, and 10 years.

Methods: Children first learn a black-white or large-small discrimination with stimuli varying on the two dimensions. In phase II, subjects are presented with one pair varying in both size and brightness and are now reinforced for approaching that stimulus which was negative in phase I. For subjects trained on black in phase I, they are reinforced for white as well as large or small in phase II. When the other pair of stimuli is introduced, subjects' selection indicates whether he is choosing according to size or color and thus whether he is making a reversal or nonreversal shift.

Findings: Although learning set training does not appear to alter the Kendlers' findings, preliminary data strongly suggest that when the form of the stimuli is changed from phase I to phase II, the number of nonreversal shifts is markedly reduced. The implications are that in the regular situation, subjects are responding to the test stimuli as they did in phase I rather than as a result of phase II training. Changing forms from phase I to phase II appears to break up this tendency.

Publication plans: Probably Journal of Experimental Psychology.

Duration: March 1962-January 1963.

Principal investigator: Wendell E. Jeffrey, Ph.D., Associate Professor of Psychology, University of California, Los Angeles 24, Calif.

Cooperating group: National Science Foundation.

16-F-8 SIMULTANEOUS AND SUCCESSIVE DISCRIMINATION LEARNING AS A FUNCTION OF ANXIETY AND SOCIAL REINFORCEMENT

Purpose: To study the effect of anxiety and social versus nonsocial reinforcement on the course of learning at two levels of difficulty in discrimination learning.

Subjects: High- and low-anxious fourth grade children.

Methods: High- and low-anxious subjects (as measured by the Children's Manifest Anxiety Scale) were given either a simultaneous or successive visual discrimination learning motor task and were reinforced for correct responses by either a buzzer or experimenter approval. All subjects received 54 trials.

Findings: Overall: Successive discrimination easier; social reinforcement produced higher level of learning. High-anxious subjects did better under social reinforcement than under buzzer reinforcement but no such difference was found for low-anxious subjects. Social reinforcement was found to facilitate the learning of the simultaneous discrimination problem but hinder the learning of the successive problem.

Publication plans: Publication is planned; study is in process of being written up for report. Future plans call for replication of the study developmentally from preschool through seventh grade.
Duration: Spring-summer 1962.
Principal investigator: Frances Degen Horowitz, Ph.D., Public Health Service Fellow and Research Associate, Bureau of Child Research, University of Kansas, Lawrence, Kans.

16-F-9 THE EFFECT OF ADAPTATION ON INSTRUMENTAL ESCAPE CONDITIONING OF ANXIOUS AND NONANXIOUS CHILDREN

Purpose: To determine the relation between anxiety and adaptation in an instrumental escape conditioning situation.
Subjects: 36 second and third grade children.
Methods: Sarason's anxiety scales were used to divide subjects into an anxious group and a nonanxious group. Half of the anxious group received adaptation to a 98-decibel tone (i.e., 20 presentations of tone) and the other half did not receive adaptation trials. Similarly, half of the nonanxious children received adaptation and half did not. All subjects received instrumental escape training. The subjects were required to pull a lever through a 12-inch excursion in order to turn off a 98-decibel tone.
Publication plans: Study will be submitted to Journal of Experimental Psychology or Journal of Comparative and Physiological Psychology.
Duration: January 1962-April 1962.
Principal investigator: R. K. Penney, Ph.D., Assistant Professor of Psychology, University of Texas, Austin 12, Tex.
Cooperating group: Hogg Foundation for Mental Health.

16-F-10 DELAY OF REINFORCEMENT AND RETENTION

Purpose: Primary object is to determine the effects of reinforcement delay during learning process and, particularly, on the retention of the learned material. The learning task consists of cognitive material, and is presented in the form of a series of discriminations. Further goals are to study the ways in which these reinforcement delay effects interact with other classes of factors, including characteristics of the material to be learned, formal learning and retention variables, and characteristics of the learner.
Subjects: Third grade children.
Principal investigator: Yvonne Brackbill, Ph.D., Department of Psychiatry, University of Colorado Medical School, 4200 E. Ninth Ave., Denver 20, Colo.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-F-11 FACTORS OF SPECIFIC SET (ATTENSITY) IN LEARNING OF GIFTED SECONDARY STUDENTS

Purpose: To find out whether very specific attitudes (sets) represent an "important" learning mechanism used by gifted secondary students.
Subjects: Within one school, gifted eleventh grade students will be divided randomly into an experimental group and a control group.
Methods: Both groups will be pretested. Experimental group will subsequently be taught States-of-origin of some U. S. Senators, but approximately three-fourths of Senators will not be used for training. A final test on all Senators will show whether being trained on only part of the material was influential in increasing learning of the untrained material, and also the final test will show whether material used in training the experimental group is communicated to the control group. In addition, on the final test students will be asked party affiliations of Senators, and these scores may reveal that the specific set (to learn States-of-origin of Senators) has generalized.

Duration: March-October 1961.
Principal investigator: Doris R. Entwisle, Ph.D., Social Science Research Council Post-doctoral Fellow, Department of Education, Johns Hopkins University, Baltimore 18, Md.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-F-12 THE LEARNING PROCESS IN A PSYCHOSOMATIC DISORDER

Purpose: To investigate the relationship between respiratory patterns of asthmatic children and a number of specific environmental events.
Subjects: Two groups of children, ages ranging from 4 to 12 years--30 with severe bronchial asthma; 30 chronically ill--matched individually on basis of age and sex.
Methods: Respiratory patterns of two groups of children will be recorded during two 10-minute experimental sessions. In each session, experimenter will manipulate the stimulus conditions in order that changes evoked in respiratory patterns can be related to environmental events (recordings of unfamiliar voices and mother's and father's voice).
Duration: September 1962-August 1962.
Principal investigators: Freya W. Owen, Ph.D., Research Associate, Laboratory of Human Development, Stanford University, Stanford, and Gordon F. Williams, M.D., Medical Director, Stanford Convalescent Home, Palo Alto, Calif.
Cooperating group: California Tuberculosis and Health Association.

Intelligence, thought, and problem solving

16-G-1 EPISTEMIC CURIOSITY AND CREATIVE THINKING: I. CURIOSITY MOTIVATION, GRADE MOTIVATION, AND GENERALITY OF LEARNING

Purpose: To compare the effects of epistemic (intellectual) curiosity and of "test-grade" motivation on two aspects of learning--rote memory and comprehension. Specifically, it was predicted that curiosity-motivated subjects would perform relatively better on comprehension than rote, and test-motivated subjects the reverse.
Subjects: Tenth grade students.
Methods: Motivation was indexed both by differential instructions and by individual difference measures of personal involvement in the learning material (in the case of curiosity) and of academic achievement (for test motivation).
Findings: (1) Overall comparison of curiosity instructions with test instructions (I.Q. and test anxiety controlled) yielded a near significant ($p < .075$) tendency in the predicted direction, the standard score differential between comprehension and rote ($Z_C - Z_R$) being higher for "curiosity" than "test" groups. (2) On eliminating "uninvolved" subjects (presumed to have been underexposed during learning from the curiosity condition, the above tendency became significant ($p < .05$). (3) A breakdown of curiosity and test groups into academic achievement by test-anxiety subgroups revealed that the obtained significant difference is confined to the high-anxiety overachievers and the low-anxiety underachievers. These two subgroups in the test condition performed significantly more poorly than their counterparts in the curiosity condition and than low-anxiety overachievers in the test condition.
Duration: Not reported-1962.
Principal investigator: Albert J. Caron, Ph.D., Section on Personality, Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.

16-G-2 METAPHOR AND PRIMARY PROCESS

Purpose: To study relationship between primary process thinking and ability to understand figures of speech.
Subjects: Schizophrenic and normal children.
Methods: Paper and pencil tests.
Duration: Fall 1962-fall 1964.
Principal investigator: Alvin G. Burstein, Ph.D., Assistant Professor of Psychology, University of Michigan, Ann Arbor, Mich.

16-G-3 CORNELL CRITICAL THINKING READINESS PROJECT

Purpose: Primary purpose is to determine at what level and to what degree students can be taught various aspects of critical thinking. Secondary purposes are the preparation of measuring instruments and the testing of certain assumptions about critical thinking and its instruction.
Methods: For each aspect of critical thinking the plan is to develop instruments, pretest students on several variables, teach them intensively for about two weeks, and give them post-tests. Multiple regression equations, which attempt to predict level of achievement after instruction, will be developed. The equations will be cross-validated and simplified. Control groups will be used to see if results are significant. Concurrently, the concept, "critical thinking," will undergo continuous refinement.
Duration: July 1962-August 1964.
Principal investigator: Robert H. Ennis, Ph.D., Associate Professor of Secondary Education, Cornell University, Ithaca, N. Y.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-G-4 LEARNING AND GENERALIZATION OF LOGICAL OPERATIONS

Purpose: Aims of project are: (1) To determine the ability of children of at least two age levels (i.e., five and eight years) to achieve the logical operations and structures basic to the conceptualization of number and the measurement and manipulation of space. The test of the child's ability to solve a variety of logical number and space problems will permit a determination of the unitary character of logical thinking in children. (2) To determine the effect of learning upon differently achieved levels of logical thinking. The provision for two types of learning ("didactic" and "inductive") will permit the assessment of the superiority of number and measurement learning with each method. (3) To determine the spread of generalization to related and unrelated logical problem-solving as a consequence of learning by didactic and inductive methods.
Duration: February 1962-January 1964.
Principal investigator: Harry Beilin, Ph.D., Assistant Professor, Department of Education, Brooklyn College, City University of New York, Brooklyn 10, N. Y.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-G-5 ON THE CONSERVATION OF SUBSTANCE, WEIGHT, AND VOLUME

Purpose: To determine the degree to which the conservation schemata generalize across situations.
Subjects: 20 students each from first, second, third, fourth, fifth, and sixth grades.
Methods: Each subject is presented with five different sets of materials (two plasticine balls; glasses of water; sets of metal cubes; plastic string; wire) and asked the standard questions required to show the operation of conservation.

Findings: (1) Substance, weight, and volume do comprise a scale for each sort of material just as Piaget has reported. (2) Conservation does not generalize perfectly across the sorts of materials used in the testing. The variance is greatest in the third and fourth grades. It disappears in the first grade when very few children show conservation, and it disappears in the sixth grade when, for substance and weight, nearly all show conservation.
Publication plans: Perhaps in Journal of Genetic Psychology.
Duration: January 1962-October 1962.
Principal investigator: Ina C. Uzgiris, Ph.D. Candidate, University of Illinois, Urbana, Ill. (Under direction of J. McVicker Hunt, Professor of Psychology, University of Illinois.)

16-G-6 AN ASSESSMENT OF CONCEPT FORMATION IN YOUNG CHILDREN

Purpose: (1) To develop techniques for assessing concept development in nursery school age children; (2) to study the role of concepts in transfer both within and across modalities with particular reference to the role of verbalization on performance; and (3) to study the role of learning sets in problem-solving in young children.
Subjects: Nursery school children in the age range of three to five years.
Methods: Individual testing sessions involving a variety of two-choice problems in discrimination.
Duration: October 1962-December 1963.
Principal investigators: Marion Blank, Ph.D., Instructor, and Wagner H. Bridger, M.D., Assistant Professor, Department of Psychiatry, Albert Einstein College of Medicine, Yeshiva University, 1300 Morris Park Ave., New York 61, N. Y.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Social behavior

16-H-1 THE DEVELOPMENT OF SOCIAL PERCEPTION DURING INFANCY

Purpose: To investigate some of the crucial perceptual discriminations made by infants with regard to their social environment, e.g., when and how they come to discriminate humans from nonhumans, mother from other people, mothers' states of attentiveness and inattentiveness.
Subjects: Normal infants from birth to about one year of age.
Methods: Experimental and systematic observation techniques of stimulus presentation and behavior recording. Visual stimuli will be employed almost exclusively, presented via photographic techniques. Behavior will be recorded primarily by trained observers with some mechanical recording.
Publication plans: Suitable journal articles will be prepared.
Duration: September 1962-September 1965.
Principal investigator: Gerald Stechler, Ph.D., Research Associate, Child Development Unit, Boston University School of Medicine, 80 E. Concord St., Boston, Mass.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-H-2 PERSON-PERCEPTION IN YOUNG SCHOOL CHILDREN

Purpose: An investigation of the dimensions of behavior used by children in their descriptions of other people; relationships of these dimensions to previous experience; and predictive usefulness of the delineation of these dimensions in terms of specific behaviors.

Subjects: Subjects drawn largely from two populations: (1) A group of elementary school children, grades one, three, five, and seven; (2) a group of University of Minnesota undergraduates.
Methods: Method of approach will vary considerably. The initial phase calls for the use of factor analytic techniques and the development of a weighting system for the generation of factor scores.
Publication plans: Results will be made available through appropriate psychological journals (Journal of Abnormal and Social Psychology, Child Development, and the Journal of Social Psychology).
Duration: October 1962-indefinite.
Principal investigator: James W. Barnard, Ph.D., Assistant Professor, Institute of Child Development, University of Minnesota, Minneapolis 14, Minn.

16-II-3 INTERPERSONAL RELATIONS PROJECT FOR STUDYING THE TWO-PERSON RELATIONSHIP

Purpose: (1) To establish two-person relationships between emotionally troubled elementary school boys and male university students that may facilitate personal growth in both participants; (2) to study changes in behavior, attitudes, and self-perception of both participants as a function of their relationship; (3) to study interaction of "similarity," "self-disclosure," and "understanding" phenomena in two-person relationships; (4) to refine methods for observing two-person interaction through use of a multimethod-multitrait matrix; (5) to develop standardized method for training college men to establish helpful relationships with emotionally troubled boys--and studying effects of that training; and (6) to prepare a model for use in other communities.
Subjects: 40 fifth and sixth grade troubled boys in relationships with 40 male college students (20 receiving training and 20 untrained). Controls: 20 boys and 20 students (as above) without such relationships.
Methods: Derived measures drawn from discrepancies in various self and "other" descriptions on semantic differential type instruments. Analysis of child-student interaction from tape recordings of conversations. Henmon-Nelson; Stanford Achievement; IPAT Children's Personality Questionnaire; and others.
Publication plans: Appropriate professional journals.
Duration: August 1962-August 1965.
Principal investigator: Gerald Goodman, Ph.D., Director, Interpersonal Relations Project, University Y.M.C.A., University of California, Berkeley 4, Calif.
Cooperating groups: Berkeley Public Schools; Institute of Human Development, University of California; Berkeley Health Department; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-II-4 COALITIONS AND STRATEGY IN SMALL GROUPS--CHANGES IN STRATEGY AS A FUNCTION OF AGE

Purpose: To study the characteristics of strategy in a simple competitive game in triads composed of children and adolescents.
Subjects: Samples of school age and high school children in approximately the following age ranges: 8-10, 12-14, 16-18; homogeneous with respect to sex.
Methods: Groups of three subjects compete in a competitive game for a prize, with observation of bargaining procedure and types of coalition. Groups vary in the pattern of internal power distribution.
Publication plans: Article will be submitted to Child Development in March 1963.
Duration: June 1962-February 1963.
Principal investigator: W. Edgar Vinacke, Ph.D., Professor of Psychology, University of Hawaii, Honolulu, Hawaii.
Cooperating group: Office of Naval Research, U. S. Department of Defense.

BEST COPY AVAILABLE

16-H-5 SOCIAL NEEDS AND GANG MEMBERSHIP

Purpose: To ascertain the motive behind joining and belonging to gangs.
Subjects: Some 500 10 year old boys.
Methods: Questionnaire plus interview.
Publication plans: As soon as project is completed, results will be summarized in an article and presented to a psychological journal.
Duration: September 1961-September 1963.
Principal investigator: Sister Mary Amatora, OSF, Ph.D., Chairman, Department of Psychology, St. Francis College, Ft. Wayne 8, Ind.
Cooperating groups: Department of Psychology, St. Francis College; public and parochial schools in and around Fort Wayne.

16-H-6 A COMPARISON OF PEER AND ADULT AUTHORITY IN THE CONTROL OF IMPULSIVITY AMONG BOYS

Purpose: To study the relationship of individual and group conceptions of behavior--specifically psychoanalytic and social psychological--as seen in the control of aggressive impulse expression. Broader purpose is to develop theory of group effects on individual personality.
Subjects: 196 latency-age boys attending a suburban school--all white, American, middle class, in fourth, fifth, or sixth grades.
Methods: One-meeting laboratory experiments with eight aggregates each consisting of eight boys each, with exposure to variations in decision-making as to a task of drawing figure 8's. Variables manipulated include high or low impulse control, high or low arousal of impulse, and exposure to adult- or peer-imposed decision about task. Measurement as to variations in resultant cohesiveness, dependence on adult, and adherence to task based on observer's ratings and responses of boys to individual interview forms.
Findings: Major finding was that in a one-meeting formed group, the boys come prepared to avow great positive feelings for peers, deny the admission of impulsive feelings, and are tremendously dependent on adult acceptance. Fifty-nine of the 64 boys rated dependence on the adult as the single most important factor in the meeting. When impulsivity continues to be aroused and no channels such as discussion are provided to help retain mastery over these feelings, meeting disintegrates into acting-out of said feelings, while a segment of the boys plead for control from adult.
Publication references and plans: Publication planned; dissertation available on inter-library loan from Western Reserve University Library.
Duration: January 1961-December 1962.
Principal investigator: John Matsushima (D.S.W. Candidate, Western Reserve University), Chief Group Worker, Children's Aid Society, 10427 Detroit Ave., Cleveland 2, Ohio.

PERSONALITY AND ADJUSTMENT

General

16-I-1 EXPERIMENTAL STUDY OF THE INFANT'S REACTION TO A CHANGE OF PHYSICAL ENVIRONMENT

Purpose: To see if there will be a period of "grief" or "mourning" following a change of physical environment.
Subjects: 60 infants of both sexes whose chronological ages range from 1 month to 12 months.
Methods: Children are transferred from an institution where there is no mother figure to a foster home. They are tested (Griffiths Developmental Scale, Piaget's object-concept stages, etc.) three days before departure from the institution, three days after arrival in the foster home, and between the second and third month after placement.
Publication plans: Dissertation; articles.
Duration: May 1962-May 1964.
Principal investigators: Therese Gouin Decarie, Ph.D., Associate Professor, and Yolande Tanguay, Ph.D. Candidate, Institute of Psychology, University of Montreal, Montreal, Que.

16-I-2 DEVELOPMENT OF SENSITIVITY OF AESTHETIC VALUES

Purpose: Initial objective is to determine how the proportion of children demonstrating various degrees of aesthetic sensitivity in response to visual art varies with age or school grade. A further objective will be to elucidate factors associated with its early appearance in some children.
Methods: Paired slides for projection will show two works of art which are of somewhat similar character but which, a group of expert judges agree, differ greatly in aesthetic quality. School children will be presented with these pairs and asked to judge which picture in each pair is the better work of art or to express a preference for one picture in the pair. Scores obtained by comparing their responses with those of experts will be considered as a function of age or school grade, both overall and for various types of pairs. Children who show unusually early agreement with the judgments of experts will be studied more intensively, along with a matched group not showing this characteristic.
Duration: September 1962-August 1964.
Principal investigator: Irvin L. Child, Ph.D., Professor of Psychology, Yale University, 333 Cedar Street, New Haven, Conn.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

Assessment of personality

16-J-1 DEVELOPMENT OF A METHOD FOR THE OBJECTIVE DESCRIPTION OF SOCIAL AND EMOTIONAL BEHAVIOR OF CHILDREN

Purpose: To develop method of collecting specific, objective, and observable behaviors of children in school. Preliminary analyses of data from a pilot study indicate that reliable, meaningful descriptions that will be useful for personality research and perhaps for mental health screening are obtained from the method.
Duration: 1960-1963.
Principal investigator: Earl S. Schaefer, Ph.D., Scientist, Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.

16-J-2 THE DEVELOPMENT AND VALIDATION OF AN IMPULSE CONTROL SCALE

Purpose: To develop and validate a projective instrument with objective scoring to be used in determining the likelihood of delinquents, alcoholics, suicides, etc., acting out. This scale attempts to measure a person's level of impulsive behavior relative to his degree of control.
Findings: One pilot study completed; two others underway. Results thus far have been quite encouraging, including discriminating between serious offenders (repeaters) and mild offenders (one or two brushes with the law).
Duration: 1958-completed.
Principal investigators: Charles F. Elton, Registrar, James E. Seegars, Jr., University Counseling Service, and Frank Chriswell, Department of Psychology, University of Kentucky; Leonard Lipton, Ph.D., Psychologist, and William Sutton, Veterans Administration Hospital; Lexington, Ky. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: Lexington Veterans Administration Hospital; Kentucky Reception Center (for delinquents).

16-J-3 ASSESSMENT OF NORMALITY AND PATHOLOGY IN CHILDHOOD

Purpose: To establish a new classification of childhood disturbances.
Methods: Analytic investigation of individual children and theoretical evaluation of clinical material.
Duration: October 1962-1965.
Principal investigators: Anna Freud, LL.D., Director, and Liselotte Frankl, B.S., Ph.D., Psychiatrist in Charge, Hampstead Child-Therapy Course and Clinic, 12 & 21 Maresfield Gardens, London N.W.3, England.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Basic processes

16-K-1 BEHAVIOR PATTERNS OF NORMAL CHILDREN: A CROSS-SECTIONAL AND LONGITUDINAL STUDY OF CHILDREN IN NURSERY AND ELEMENTARY SCHOOL

Purpose: To investigate personality patterns of children from age 3-5 years to 10 years, and to assess the consistency of their behavior through nursery and elementary schools.
Subjects: 138 boys and girls of above average intelligence who attended the nursery school at the Institute of Human Development, University of California, Berkeley, and then entered elementary schools in the San Francisco Bay area.
Methods: Children were rated each semester on 61 rating scales by several teachers; scales were factor-analyzed.
Findings: Preliminary results indicate six important personality factors at the nursery school level--sociability, socialization, emotional reactivity, anxiety, verbal behavior, and achievement.
Publication plans: Research monograph or articles in psychological journals.
Duration: June 1958-1964.
Principal investigators: Samuel R. Pinneau, Ph.D., Coordinator of Child Study Center, San Fernando Valley State College, Northridge, and Ronald C. Dillehay, Ph.D., Lecturer in Public Health, University of California, Berkeley 4, Calif., and Julius M. Sassenrath, Ph.D., Associate Professor of Education, Indiana University, Bloomington, Ind.

16-K-2 DEVELOPMENTAL ASPECTS OF PERCEPTION OF THE BODY IMAGE

Purpose: The integration of percepts and ideas about the characteristics of one's body is a fundamental developmental task. To date, little is known regarding the processes and stages whereby such integration normally develops. Proposed study will explore some aspects of this problem by testing individuals' judgments of the proportions, size, and extension of their own body.
Subjects: About 400 normal males and females ranging in age from early childhood to senescence. At least 30 subjects per age level represented will be sampled.
Methods: Data with respect to the following dimensions will be obtained: (1) intelligence; (2) general spatial acuity; (3) self-drawings; (4) self-recognition (pictures of the subjects' bodies will be interspersed among a series of others); (5) estimates of entire body size, of the size of body parts, and of the "reach" of arms and legs; (6) estimates of the proportion of head, truck, arms and legs, respectively, in relation to the remainder of the body; and (7) estimates of the relative maturity (or age) of the subject's own body. Photographs, sketches of body outlines, projected images, and experimental tasks involving judgments of the extension of the body in space will be used to measure the dimensions to be investigated.
Duration: May 1962-1965.
Principal investigator: Elizabeth Gellert, Ed.D., Association for the Aid of Crippled Children, 345 E. 46th St., New York, N. Y.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-K-3 DEVELOPMENT OF SOCIAL CLASS AWARENESS, SELF-IDENTIFICATION, PREFERENCE, AND PERCEPTION OF ADULT PREFERENCES IN LOWER CLASS CHILDREN

Subjects: 480 lower class children of matched environmental, racial, and sex groupings with ages equally distributed from 3 to 12 years; 120 upper and 120 middle class children as control groups.
Methods: Interviews using dolls or puppets dressed in the lower class and in the middle and upper class manner.
Publication plans: Dissertation Abstracts; New York University Doctoral Dissertation Files.
Duration: February 1962-June 1962.
Principal investigator: Mary M. Allen (Ph.D. Candidate, New York University), Teacher, Public School 165, New York, N. Y.

16-K-4 RELATIONSHIP BETWEEN SELF-CONCEPTS OF NEGRO ELEMENTARY SCHOOL CHILDREN AND THEIR ACADEMIC ACHIEVEMENT, INTELLIGENCE, INTERESTS, AND MANIFEST ANXIETY

Purpose: To determine and compare the self-concepts of fourth and sixth grade children, and to determine whether these self-concepts are related to their academic achievement, intelligence, interests, and manifest anxiety.
Subjects: Approximately 300 children drawn from the fourth and sixth grades of three randomly selected Negro elementary schools of East Baton Rouge Parish and the Southern University Laboratory School (Laboratory School included since its clientele differ in socio-economic status from other schools in the parish).
Methods: Stanford Achievement Test results; Thorpe "What I Like to Do" Interest Inventory scores; Primary Mental Abilities Test results; Michigan Picture Test performances; Manifest Anxiety scores (Castenada, et al.); and cumulative records. Comparisons will be made by sex, grade, and socio-economic status. Data from a similar study by Bledsoe and Garrison will be used for purposes of racial comparisons. Appropriate descriptive and inferential statistical procedures will be employed in the analysis.
Duration: May 1962-April 1964.
Principal investigators: Comradge L. Henton, M.A., Assistant Professor and Edward E. Johnson, Ph.D., Professor, Department of Psychology; Augustus Blanks, Ph.D., Professor of Special Education; and Dr. Joseph McKelpin, Professor of Education and Principal of the Laboratory School, Southern University and Agricultural and Mechanical College, Baton Rouge, La.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-K-5 DEVELOPMENT OF SEX-ROLE CONCEPTS AND ATTITUDES

Purpose: (1) Clarification of causal sequences in three empirically associated components of sex-role identification. (Does preferential imitation of the same-sex parent precede or follow preferential attachment to him? Does stable sex-type identity precede or follow imitation of the same-sex parent?) (2) Assessment of Piaget stages or cognitive tasks as defining sequences in individual development. (3) Study of relations between cognitive development on matched social and nonsocial concepts. General aim of study is to clarify relations between cognitive and social development.
Subjects: Matched bright and average children, aged four to eight.
Methods: Follow-up testing; projective and behavioral measures of sex-role attitudes; Piaget tasks paralleled by cognitive tasks involving sex-role concepts, e.g., physical constancy and constancy of sex-identity.
Duration: Not reported-1963.
Principal investigator: Lawrence Kohlberg, Ph.D., Assistant Professor of Psychology and Human Development, University of Chicago, Chicago 37, Ill.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-K-6 CINEMANALYSIS OF EMOTIONAL RESPONSES OF INFANTS

Purpose: (1) To investigate the relationship between strength and duration of emotional disequilibrium after a stress situation and variables of sex, adoptive and nonadoptive infants, and direction of responses; and (2) to further develop techniques for analyzing human behavior through cinematography.
Methods: Memo-motion pictures of 100 one year old infants and their mothers during a standardized dressing situation and immediately following a stress experience will be observed and categorized through the use of a special modified memo-motion analysis projector with synchronized recorder and IBM key punch. As the judges are viewing the film, response categories will be recorded on to IBM cards with statistical analysis to determine judges' reliability, relationship between strength and duration of emotional disequilibrium and sex, adoption and nonadoption status.
Duration: 1962-1964.
Principal investigators: Damaris Pease, Ph.D., Associate Professor of Child Development, Louis A. Facto, M.S., Assistant Professor and Photographer, Iowa Agricultural and Home Economics Experiment Station, and Leroy Wolins, Ph.D., Associate Professor of Psychology and Statistics, Iowa State University of Science and Technology, Ames, Iowa.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-K-7 THE RELATIONSHIP OF GALVANIC SKIN RESPONSE TO DREAMS AND SLEEP

Purpose: To gather more physiological data on normal and aberrant sleep (e.g., enuresis).
Subjects: Children, ages 5-10.
Methods: Children sleep all night while their dreams (rapid eye movements) and GSR are recorded. For bedwetters, an electrical device signals the moment of wetting.
Publication plans: Data will be submitted to psychiatric journals.
Duration: August 1962-indefinite.
Principal investigator: Chester M. Pierce, M.D., Assistant Professor of Psychiatry, University of Oklahoma Medical Center, Oklahoma City 4, Okla.
Cooperating group: Veterans Administration.

16-K-8 PERSONALITY CHARACTERISTICS RELATED TO SUSCEPTIBILITY TO HYPNOSIS IN CHILDHOOD

Purpose: To establish developmental influences upon personality, with hypnotic susceptibility as one indicator.
Subjects: Kindergarten and school age children, through high school.
Methods: Hypnotic induction, individual and parental interviews, verbal and experimental tests of individual differences.
Findings: Children, ages 6-12, are not only more susceptible to hypnosis than college students, but show particularly high areas of susceptibility, especially visual hallucinations and amnesia.
Publication plans: Article by Rosemarie K. Moore, and Lillian W. Laver, based on earlier work, submitted for publication.
Duration: 1961-1964.
Principal investigators: Ernest R. Hilgard, Ph.D., Professor of Psychology, and P. M. Bentler, Ph.D. Candidate, Laboratory of Human Development, Stanford University, Stanford, Calif.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-K-9 WISH-FULFILLMENT, PESSIMISM AND COMPROMISE--THEIR ROLE IN NORMAL DEVELOPMENT AND PSYCHOPATHOLOGY

Purpose: To study the responses of normal children and of emotionally disturbed children to situations which are frustrating or emotionally arousing.
Subjects: Normal children, ages 5-16 (for developmental study), and control group. Various types of emotionally disturbed children.
Methods: A series of tests of story completion and picture-story completion type specifically designed for study. Developmental trends and normative data on the tests have been obtained.
Publication plans: A chapter has been submitted for a book which will deal with adjustment problems in the classroom.
Duration: 1959-1962.
Principal investigator: Virginia I. Douglas, Ph.D., Assistant Professor of Psychology, McGill University, and Senior Psychologist, Montreal Children's Hospital, Montreal, Que.
Cooperating group: Department of National Health and Welfare of Canada.

16-K-10 THE MORAL JUDGMENT OF THE ADOLESCENT

Purpose: Studies concerning the development of moral judgment have been under way in the Psychology Department since 1960. First results indicated continous development in the increasing use of intentionality (i.e., the taking account of intentions or motives as a criteria in the evaluation of misdeeds or crimes) through late adolescence. In addition to developing more refined tools for a more incisive analysis of the use of intentionality, it is hoped to relate the developing use of intentionality to the use of animism.
Subjects: It is hoped to increase sample of subjects to permit a more thorough analysis of the relevant variables involved in this important aspect of socialization. Samples of adolescents from differing ethnic groups, as well as adolescents raised in Kibbutz (communal) settlements would be included.
Principal investigator: Sol Kugelmass, Ph.D., Department of Psychology, The Hebrew University, Jerusalem, Israel.

16-K-11 TOLERANCE FOR PAIN AND SUFFERING

Purpose: To further explore: (1) relationship found between perceptual characteristics and some measurable aspects of personality on the one hand, and tolerance for the stress of pain and the intolerance for the stress of confinement and isolation on the other hand, and the

implications of this relationship; (2) changes in these perceptual characteristics that can be environmentally induced; and (3) atypical perceptual characteristics that have been found in some juvenile delinquents and in some patients with clinical indications of brain pathology.
Subjects: Boys and girls held at Massachusetts Youth Service Board Detention Centers; Negro boys attending a settlement house in Boston; high school students in the city of Cambridge; children of workers attached to the Marine Biological Laboratories and Oceanographic Institute, Woods Hole; and music students attending classes in Concord.
Findings: A sizeable proportion of juvenile delinquents show an atypical pattern of behavior in respect to tactual measures so far developed. Thus far, this atypical pattern--"stimulus governed"--has also been found in patients with clinical indications of brain pathology. A large number of the "delinquents" are extreme Reducers, belonging to the type identified as in constant need of changing sensory input. Three kinds of persons, differing in their vulnerability to pain and stress and in their method of processing the sensory environment have been experimentally identified: (1) the Reducer tends subjectively to decrease perceived size. He is tolerant of suffering from pain, but is intolerant of the stress of monotony and incarceration; (2) the Augmenter tends subjectively to increase perceived size. He is intolerant of suffering from pain, but is tolerant of the stress of monotony and incarceration; and (3) the Moderate alters perceived size very little. He is moderately tolerant of suffering from pain and of the stress of monotony and incarceration.
Publication references: Acta Psychologica 19:755-756, 1961; Journal of Nervous and Mental Diseases 134:5:415-421, May 1962.
Duration: 1958-indefinite.
Principal investigator: Asenath Petrie, Ph.D., Research Associate, Department of Psychiatry, Harvard Medical School, Department of Surgery, Beth Israel Hospital, and Boston Sanatorium, Boston, Mass.

Emotional and personality disturbances

16-L-1 DIAGNOSTIC CLASSIFICATION OF PROBLEM CHILDREN

Purpose: To determine classification categories for problem children on the basis of behavior symptoms as reported to community guidance centers by their parents and professional workers.
Subjects: 500 children, aged 5 to 15 years, referred to community child guidance centers for diagnosis and treatment.
Methods: Questionnaires, spontaneous reports by mothers, reports by social workers, reports by clinical psychologist, reports by psychiatrists. Analysis of data by objective methods includes percentage analysis, intercorrelation of all behavior symptoms together with items related to physical and social characteristics, factorial analysis, identification of factors which have been previously isolated.
Findings: Preliminary findings seem to support hypothesis that some factors such as aggression, anxiety, school behavior, enuresis, jealousy, running away, sex behavior, broken marriage, working mothers, etc, tend to cluster in various patterns which in the later study may be identified as behavior patterns corresponding to diagnostic categories of disturbed children.
Publication plans: A monograph or even a book, if financially assisted, is being planned.
Duration: September 1960-April 1962.
Principal investigator: Boleslaw A. Wysocki, Ph.D., Associate Professor of Psychology, Newton College of the Sacred Heart, Newton 59, Mass.

16-L-2 DEVELOPMENT OF A TECHNIQUE FOR STUDYING AND A PILOT STUDY OF BEHAVIOR AND BRAIN WAVES.

Purpose: (1) To develop a technique for the sound motion picture photography of behavior and telemetered brain waves. (2) To do a pilot study of the application of this technique to the clinical study of children with mental disorder and electroencephalographic disturbance.

Subjects: Children from the Inpatient Service of the Langley Porter Neuropsychiatric Institute.
Methods: Use of a special sound camera for recording behavior and telemetered electroencephalograms.
Publication plans: Article by R. Vreeland et al., Electroencephalography and Clinical Neurophysiology (in press); findings presented to California Medical Association, 1962, and submitted to American Journal of Psychiatry.
Duration: October 1961-June 1962.
Principal investigator: A. J. Gianascol, M.D., Senior Psychiatrist, Langley Porter Neuropsychiatric Institute, and Assistant Clinical Professor of Psychiatry, University of California School of Medicine, San Francisco, Calif.
Cooperating group: C. L. Yeager, M.D., Director of Electroencephalography Laboratory, Langley Porter Neuropsychiatric Institute.

16-L-3 HABITUATION AND MOTOR CONTROL IN EMOTIONALLY DISTURBED CHILDREN

Purpose: To study basic processes of adaptation and control in response to sudden stimulation among different diagnostic categories of emotionally disturbed children, and to study effects of psychotropic drugs on these processes.
Subjects: Approximately 100 emotionally disturbed children referred to an outpatient treatment facility and approximately 80 children in residential treatment facilities for disturbed and homeless children.
Methods: On the basis of rating scales, symptom checklists and psychiatric interview, subjects are diagnosed as neurotic (inhibited, withdrawn, anxiety symptoms) or as hyperkinetic (acting-out, restless, poor control). Subjects are subjected to a rapid discrimination test during which time measurements are made by a pneumopolygraph of ability to execute simple motor responses. They are given a series of loud noises and motor control is measured and compared to initial level. Stimulant and depressant drugs are given and the effects on motor control noted.
Findings: Preliminary data indicate slower rates of adaptation among hyperkinetic children.
Publication plans: To be submitted to Journal of Abnormal and Social Psychology.
Duration: May-November 1962.
Principal investigators: Leon Eisenberg, M.D., Professor of Child Psychiatry, and C. Keith Conners, Ph.D., Instructor in Medical Psychology and Pediatrics, Johns Hopkins Hospital, Baltimore 5, Md.
Cooperating groups: Esther-Loring Richards Center, Owings Mills, Md.; Cylburn Home for Children, Baltimore; Harriet Lane Home for Children, Johns Hopkins Hospital.

16-L-4 READING SKILLS IN EMOTIONALLY DISTURBED, INSTITUTIONALIZED ADOLESCENTS

Methods: Clinical records and test data of 74 Western State Hospital patients who met certain requirements (age, race, I.Q., tests available) were examined. The able readers (43.2 percent) were compared with the disabled readers (31.1 percent of total group).
Findings: Factors previously reported to be etiologically important in reading disability were for the most part not confirmed by this study. A disproportionate number of boys again appear as reading problems. "General gross verbal incapacity" was the only symptom of Rabinovitch's "Primary Reading Retardation" syndrome that differentiated the poor from the able reader. In marked contrast to previously reported data, atypical birth and visual problems occurred significantly more often among the adequate readers. Reports of previously reported investigations involving a pattern analysis of either the Wechsler-Bellevue or the Bender Gestalt could not be replicated in this study.
Duration: Completed 1962.
Principal investigator: Helen E. Shimota, Ph.D., Clinical Psychologist, Mental Health Research Institute, P.O. Box 907, Ft. Steilacoom, Wash.

BEST COPY AVAILABLE

16-L-5 EFFECTS OF GEOGRAPHICAL MOBILITY AND PARENT PERSONALITY FACTORS ON EMOTIONAL DISORDERS IN CHILDREN

Purpose: To determine whether incidence of geographical mobility is a significant factor in the development of emotional disorders in military children; to determine parent personality variables and parent-child relationship factors which interact with geographical mobility in emotionally disturbed military children. Previous reports indicate a significant relationship between mobility and psychiatric casualty rates, but social class factors have been consistently confounded with mobility rates.
Subjects: Emotionally disturbed male dependents, ages 11 to 15 years, referred to the Child Psychiatry Service, Walter Reed General Hospital; normal male military dependents, matched with respect to child's age, family socio-economic level, and paternal occupational area.
Methods: A detailed interview is employed to obtain data on family relocations, changes in residence, changes in school placement, etc. Information on father's absence is also being secured for control purposes. Several questionnaire techniques, including scales developed specifically for the project, are administered to parents and children to obtain data on parent personality variables and parent-child relationships.
Duration: January 1962-August 1963.
Principal investigators: Captain Frank A. Pedersen, Ph.D., Chief Psychologist, and Captain Eugene J. Sullivan, M.S.W., Child Psychiatry Service, Walter Reed General Hospital, U. S. Department of Defense, Washington 12, D. C.
Cooperating group: Army Medical Reserach and Development Command, U. S. Department of Defense.

16-L-6 STUDY OF FAMILIES OF CHILDREN IN RESIDENTIAL TREATMENT

Purpose: In the families studied, there is: (1) a relinquishing of the executive guidance function by the parents; and (2) a sibling subsystem with its own values, existing in dynamic opposition to the parents. It is assumed that these factors are of crucial importance in the lack of development of internal controls in the child. Therapeutic objectives are to improve communication between parents and siblings, institute or restore executive functioning in the parents and to utilize the dynamics of the sibling subgroup towards positive influences upon the child.
Subjects: Families of low socio-economic status, with sons in a residential treatment center serving boys between the ages of 8 and 14, and with more than one acting-out child--37 families will be studied diagnostically and 10 families will be carried for two years in therapy.
Methods: Research team has designed a multiple-therapist technique involving a team of three therapists. The family can be seen as a whole and separated into its component parts in one multistage session. This allows work with the siblings as a subgroup in the absence of the parents.
Duration: January 1962-December 1963.
Principal investigators: Salvador Minuchin, M.D., Director, Continued-Care Program, Charles H. King, M.S.W., Director of Social Services, and Edgar H. Auerswald, M.D., Clinical Director, Wiltwyck School for Boys, Inc., 271 W. 125th St., New York 27, N. Y.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-L-7 A STUDY OF INTERPERSONAL RELATIONS WITHIN FAMILIES

Purpose: To determine the effects of family unit composition and sequence upon the amount and kind of data that can be obtained concerning family transactions and their impact on the child-patient.
Subjects: 24 primary families, selected according to stated criteria, who are seeking aid from Craig House for child and/or family emotional difficulties.
Methods: Each family will be interviewed in six units--the family together, parents together, each parent separately, referred child alone, all siblings together. Interviews will be stereophonically recorded on tape. Interviewers will report family dynamics, significant family incidents, interpersonal perceptions, family relationships, conflict areas, and family dynamics

relative to the child-patient's problems. Clinical judges will audit the tapes and record their judgments in the same five categories. All factors of family, family unit, sequence, interviewer, and judge selection and scheduling will be so randomized as to minimize any systematic bias. Qualitative and quantitative analyses will be made of the data recorded by interviewers and judges.
Publication plans: Probably in 1965.
Duration: September 1962-September 1965.
Principal investigator: Edward J. Carroll, M.D., Medical Director, Craig House for Children, 201 S. Craig St., Pittsburgh 13, Pa.

16-L-8 A STUDY OF THE EARLY ENVIRONMENT OF ALCOHOLICS AND ITS RELATIONSHIP TO ADULT BEHAVIOR

Purpose: To investigate dependent and independent variables of alcoholism, and their interrelations by differentiating certain types of alcoholics from nonalcoholics on the basis of environmental stimuli impinging upon them during the first 10 years of life. To explore relationship of adult behaviors, other than alcoholism, to these early experiences.
Subjects: Alcoholics and controls, matched for sex, age, education, Wechsler-Bellevue I.Q., and vocation, and selected on basis of scores on University of Tennessee Alcoholism Scale.
Methods: Intensive interviewing using Pascal-Jenkins Behavioral Scales which yield ratings based on actual behavior, not on opinions or attitudes of subjects. Interviewers elicited accounts of manifest behavior of parents, grandparents, siblings, and peers (referred to as stimuli) in such areas as frequency of contact, physical punishment, displays of affection, physical health, religious observance, and marital compatibility. Variables were rated as to whether or not they deviated from expectancy for the status of the particular stimulus under observation. Further study was made of cross-sesional behavior at the time of observation. This behavior was then compared across and within populations
Publication references: Quarterly Journal of Studies on Alcohol 21:1:40-50, March 1960.
Duration: July 1958-July 1962.
Principal investigators: Gerald R. Pascal, Ph.D., Professor, William O. Jenkins, Ph.D., Professor, and Clifford H. Swensen, Ph.D., Associate Professor, Department of Psychology, University of Tennessee, Knoxville, Tenn.
Cooperating groups: Psychological Services Center, University of Tennessee; Tennessee State Alcoholism Commission.

16-L-9 INTELLECTUAL DEFICIT IN SCHIZOPHRENIA

Purpose: Hypotheses: (1) the adult schizophrenic functions at a lower intellectual level than he did in childhood; and (2) the childhood I.Q. of the adult schizophrenic is lower than that of his peers from the same neighborhood and year (Part of an overall study on schizophrenic intelligence listed in Bulletin 15, Research Relating to Children.)
Subjects: Hospitalized schizophrenics from both veterans' and State hospitals for whom childhood intelligence test scores were available. Second grade scores on the Kuhlmann-Anderson Group Intelligence test were available for subjects used to test hypothesis (2).
Methods: Second grade Kuhlmann-Anderson I.Q.'s of 31 hospitalized schizophrenics were compared with their Wechsler-Bellevue I.Q.'s taken after they were hospitalized as adults, by means of a t test. The mean of the second grade Kuhlmann-Anderson I.Q.'s for a sample of 70 schizophrenics was compared with that of the mean of all second grade children in Cleveland Public Schools tested in November 1949. Results for each child who was to be an adult schizophrenic were compared to results for his own homeroom to control for neighborhood, ethnic background, and socio-economic status. In both cases, the childhood I.Q.'s scores of the schizophrenics-to-be were lower than the city average as a whole and lower than the medians of their own homerooms.
Publication references: Presented at American Psychological Association meeting, 1962; Ph.D. dissertation on file at Western Reserve University library.
Duration: Completed.
Principal investigators: Jeanette Reuter (Ph.D. Candidate, Western Reserve University), Lecturer, University of Maryland European Branch, Victoriastr. 3, Kronberg/Ts, Germany; George W. Albee, Ph.D., Professor, and Ellen A. Lane, Ph.D., Research Associate, Department of Psychology, Western Reserve University, Cleveland 6, Ohio.

Cooperating groups: Western Reserve University; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-L-10 STUDY OF CHILDHOOD SCHIZOPHRENIA USING PIAGET AND PSYCHOANALYTIC THEORIES

Purpose: To study early ego development.
Subjects: Schizophrenic children, 3 to 10 years of age.
Methods: Observations in a school for emotionally disturbed children (Clerk). Rorschach studies of mothers of schizophrenic children (Lavoie).
Publication plans: Publication in 1963.
Duration: 1960-1963.
Principal investigators: Gabrielle Clerk, Ph.D., Assistant Professor, and Germain Lavoie, Ph.D. Candidate, Department of Psychology, University of Montreal, Montreal, Que.

16-L-11 EXPERIMENTAL RESEARCH IN INTERPERSONAL RELATIONS: II. A THEORETICAL AND METHODOLOGICAL BASIS FOR STUDY OF CHILDHOOD PSYCHOSES

Purpose: Application of a new method for obtaining quantified data on location and progression of the child's interest in a standardized play situation to the study of the significance of home visits.
Subjects: Children diagnosed as schizophrenic, presently residing in the children's unit at Camarillo State Hospital.
Methods: Assessment on a continuous basis of the child's interest patterns, utilizing a four-channel impulse recorder.
Findings: Preliminary findings indicate the method, which yields objective data, is sensitive to clinical differences among the children.
Publication plans: Preliminary publication to be submitted shortly; further publications may be expected in 1964.
Duration: September 1962-September 1964.
Principal investigator: Michael Nesbitt, Ph.D., Clinical Psychologist II, Camarillo State Hospital, Camarillo, Calif.
Cooperating group: California State Department of Mental Hygiene.

16-L-12 BEHAVIOR AND COMMUNICATION IN CHILDHOOD SCHIZOPHRENIA

Purpose: An attempt to treat and study a small group of schizophrenic children and their parents. Its purpose is to demonstrate an approach toward understanding these children, their parents, and particularly their pathological interactions. It focuses on problems of communication and uses the therapist's relevant inner reactions to give meaning to his "objective" observations. An essential aspect of this approach is the close collaboration and communication among the total staff which sustains the therapist through crises and the necessarily disturbing experiences in his therapy with these families. The need for such a project arose out of the necessity to help and understand severely disturbed children living at home, for whom residential placement was unavailable or had proved to be unsuccessful.
Subjects: Project envisions a Day Care Center for about 15 school age children with an educational and recreational program which will be an integral part of the total therapeutic environment.
Methods: Extensive records will be kept on individual therapy of each child and his parents as well as of child's behavior and progress at school. Clinical data will be analyzed to confirm or refute tentative hypotheses. It is hoped that, more than proving or disproving the original ideas, results will make possible the definition of new concepts and formulation of testable hypotheses about some aspects of childhood schizophrenia.
Duration: 1962-1967.
Principal investigators: Itamar Yahalom, Annette Klein, M.A., and staff, Jewish Children's Bureau, 1 S. Franklin, Chicago 6, Ill.
Cooeprating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-L-13 EDUCATIONAL REHABILITATION OF CHILDHOOD SCHIZOPHRENICS

Purpose: (1) To demonstrate that it is possible to program for seriously disturbed children in a community setting and, while assisting them educationally, to help them develop emotional impulse controls; (2) to demonstrate that this can be accomplished at a cost of little more than the annual per pupil cost for children generally; (3) to identify the factors operative on an ongoing basis which enable this project to succeed, and subsequently to enable the children to make a successful transition to the regular school program; and (4) to identify the impact of the program on the community generally.
Subjects: Childhood schizophrenics; children with a diagnosis of chronic brain syndrome; and combinations thereof.
Methods: Identification and tabulation of educational materials and methods, analysis of costs, etc.; use of two school psychologists and the psychiatric consultant to observe quantify and analyze psychological factors operative; use of informants to identify impact on the community.
Duration: June 1962-June 1963.
Principal investigators: George T. Donahue, M.A., Assistant to Supervising Principal, and Sol Nichtern, M.D., Psychiatrist, Union Free School District #16, Town of Hempstead, Elmont, N. Y.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-L-14 A FOLLOW-UP STUDY OF CHILDREN WITH EARLY EMOTIONAL DISORDERS

Purpose: A follow-up study of approximately 60 children who experienced emotional problems during their preschool years. All of these children attended a therapeutic nursery school associated with the Department of Psychiatry of the School of Medicine at Western Reserve University, where they received individual therapy or their mothers received extensive guidance in addition to the educational program at the nursery school. Present study will attempt to determine their adjustment in various areas, by means of psychiatric interviews, interviews with parents and teachers, and analysis of school records. It is also hoped that the effect of their nursery school experience upon their present adjustment can be determined.
Duration: September 1962-August 1964.
Principal investigators: Anny Katan, M.D., Professor of Child Analysis, Department of Psychiatry, Marvin Ack, Ph.D., Assistant Professor of Psychology in Psychiatry, and 12 child analysts, University Hospitals, Western Reserve University, Cleveland, Ohio.
Cooperating group: Grant Foundation.

16-L-15 DAY CARE CENTER FOR DISTURBED ADOLESCENTS

Purpose: Demonstration project for emotionally disturbed adolescents in a psychiatric center to provide: (1) an alternative to inpatient treatment; and (2) a setting for effective prevocational and vocational rehabilitation.
Subjects: Adolescents, ages 14 to 21,referred by the Rhode Island State Division of Vocational Rehabilitation.
Methods: Descriptions of organization and process of service. Selected studies of social-demographic, and clinical backgrounds of patients. Follow-up after discharge.
Publication references: Mental Hygiene 46:223-229, April 1962.
Duration: June 1960-June 1965.
Principal investigators: Charles H. Jones, M.D., Superintendent, Butler Hospital, and Harold W. Pfautz, Ph.D., Associate Professor, Department of Sociology and Anthropology, Brown University, Providence, R.I.
Cooperating groups: Butler Hospital; Rhode Island State Division of Vocational Rehabilitation; Office of Vocational Rehabilitation, U. S. Department of Health, Education, and Welfare.

16-L-16 GROUP THERAPY WITH AUTISTIC CHILDREN

Purpose: To demonstrate a method to increase verbal communication and social interaction in autistic children.
Methods: Method consists of a group therapy procedure which combines autistic children with children who, though emotionally handicapped, are more ego-intact, reality-oriented, and verbal. This procedure is conducted within a total therapeutic milieu which is directed toward building ego strength and reality concepts and toward providing a variety of situations in which the autistic child can experiment and expand the skills, first learned in the group sessions, in verbal communication and social interaction. The demonstration project centers about the observation and collection of data of the two different, but related, aspects of the program--group therapy sessions and total complex of relationships among the children and between staff members and the children. Major emphasis of detailed observation will be placed upon group therapy sessions in which a research observer will record the interactions of the children and the therapist. Analysis of results will lead to a careful account of the therapeutic processes involved which could be utilized in other settings treating similar types of children.
Duration: 1962-1965.
Principal investigators: Louise L. Wiener, Executive Director, East Bay Activity Center, 2525 Perkins Rd., Oakland, Hubert S. Coffey, Ph.D., Associate Professor of Psychology, University of California, Berkeley, and Christoph M. Heinecke, Ph.D., Research Associate, Psychiatric Clinic, Mt. Zion Hospital and Medical Center, 1600 Divisadero St., San Francisco 15, Calif.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-L-17 INTERMEDIARY GROUP TREATMENT OF INACCESSIBLE CHILDREN

Purpose: Clinical study to investigate effectiveness of selected, described techniques of psychiatric group social work treatment in readying inaccessible children for usual child guidance outpatient individual treatment.
Subjects: Children aged 6 to 11, found by trial to be inaccessible to usual outpatient office-interview treatment.
Methods: Certain ego deficiencies believed to be common to these children and central to their inability to use individual treatment are described. Group social work treatment techniques being developed, using particular activity media, are directed toward remedying the specified ego deficiencies. These techniques will be applied during six months of biweekly group social work treatment, during which children will be seen in small groups in the Guidance Center. Measurements will be made of these interventions and of their observed effectiveness in promoting development of the designated ego functions. At the close of group treatment, each child will be offered three months of individual treatment, with application of accessibility measurements to test for improvement in capacity to use the usual guidance clinic individual outpatient treatment. Data analysis will be reported primarily in case analysis form.
Duration: January 1962-June 1964.
Principal investigators: Claire M. Ness, M.D., Director, and Grace Ganter, D.S.W., Psychiatric Group Therapist, and staff, Cleveland Guidance Center, Inc. 2050 E. 96th St., Cleveland 6, Ohio.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-L-18 MUSIC THERAPY PROJECT FOR PSYCHOTIC CHILDREN UNDER SEVEN

Purpose: (1) Through specific music techniques, to establish contact with and introduce speech and other forms of simple reality to relatively speechless, negativistic, or withdrawn psychotic children; and (2) to study and evaluate responses to the music therapy experience. Theoretical considerations: music involves sounds, rhythm, time, repetition, motor expression, essentially basic and preverbal in nature. Psychotic children project their inner emotional state through the nature of the rhythms they evidence on percussion instruments and through other motor behavior.

Methods: Music therapy in Day-Care Unit setting. After determining the child's rhythmic pattern and frequency, music, matching and following the child's basic beat, is improvised. Once interest is mobilized in this way, the child is led to follow changes of tempo toward a more normal regularity and rate. Gradually, increasingly complex elements of musical structure are added--melodic and harmonic rhythms, dissonances, retards, "question and answer" phrases, etc. These require increasing attention span, concentration, frustration tolerance, impulse control, and sound tolerance, resulting in gratification and security via mastery and establishment of relationship with the therapists. Individualized songs relating to the child's affective state introduce simple reality concerning things, feelings, and behavior. Lyrics stimulate imitative and communicative speech. Results are being analyzed by clinical evaluation of rate of change of general behavioral capacities using a behavior rating scale for specific variables.
Duration: May 1962-March 1965.
Principal investigators: Mitchell L. Dratman, M.D., Assistant Professor and Chief, Section of Child Psychiatry, and Bertram A. Ruttenberg, M.D., Director of Day-Care Unit and Associate, Department of Psychiatry, University of Pennsylvania, 3400 Walnut St., Philadelphia 4, Pa.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-L-19 THE EFFECTS OF CHLORPROMAZINE ON THE BEHAVIOR AND INTELLECTUAL PERFORMANCE OF HYPERACTIVE CHILDREN

Purpose: To obtain information which will increase our understanding of the hyperactive syndrome in children and to study the effects of chlorpromazine on the behavioral and intellectual functioning of a group of hyperactive children.
Subjects: Hyperactive children, ages 7 to 12 years. (Hyperactivity is defined as pathological state of overactivity and excitability together with marked distractability.) Normal control subjects, ages 7 to 12 years.
Methods: A large battery including clinical ratings, teacher ratings, school observations, I.Q. tests, perceptual motor tests, frustration-tolerance tests, concept-formation tests.
Duration: 1962-1965.
Principal investigators: Virginia I. Douglas, Ph.D., Assistant Professor of Psychology, McGill University, and Senior Psychologist, Montreal Children's Hospital; Drs. John Werry and Gabrielle Weiss, Psychiatrists, Montreal Children's Hospital, Montreal, Que.
Cooperating groups: McGill University; Montreal Children's Hospital; Smith, Kline, and French Drug Company

16-L-20 PREDICTION OF TREATABILITY OF ACTING-OUT CHILDREN FROM PSYCHOLOGICAL TESTS

Purpose: To determine whether it is possible to predict from psychological tests which children are most likely respond to psychotherapy.
Subjects: Cases selected from clinic files of past year--six treatment cases and six nontreatment cases.
Methods: At present, establishment of test criteria by which to verify whether there is a psychological test difference between the treatment and nontreatment cases.
Publication plans: Nothing definite; often, material at this clinic is mimeographed.
Duration: Summer 1962-indefinite.
Principal investigators: Vita Krall, Ph.D., Staff Psychologist, Jerome J. Schiller, Ph.D., Chief Psychologist, and Elwyn Smolen, M.D., Director, Child Guidance Clinic of Greater Bridgeport, Inc., 1081 Iranistan Ave., Bridgeport, Conn.

Delinquency

16-M-1 PSYCHOLOGICAL CHARACTERISTICS OF DELINQUENTS ON THE HAND TEST

Purpose: Preliminary study to ascertain whether the same variables, and by implication their psychological concomitants, which distinquished antisocial adults on the Hand Test (a new projective technique described in a monograph by Bricklin, Piotrowski, and Wagner) could also be used to differentiate normal and delinquent teenagers.
Subjects: 15 male and 15 female convicted juvenile offenders gathered randomly from the Juvenile Testing Center, Akron, Ohio; 30 controls drawn from three Akron high schools, matched for sex and age.
Methods: Administration of the Hand Test to each subject and computation of an "acting-out" ratio (an algebraic score obtained by subtracting the socially cooperative interpersonal responses from the socially negative or uncooperative interpersonal responses).
Publication references and plans: Preliminary report presented at Eastern Psychological Association meeting, 1962; cross-validation study now underway.
Duration: April 1961-April 1962.
Principal investigators: Edwin E. Wagner, Ph.D., Department of Psychology, University of Akron, 302 E. Buchtel Ave., and Mrs. R. Snyder, Juvenile Court, 650 Dan St., Akron, Ohio.

16-M-2 AN ANALYSIS OF INTERCORRELATIONS AMONG ADJUSTMENT SCORES ATTAINED BY DELINQUENTS ON INDEPENDENT AND EXPERIMENTAL MEASURES BASED ON THE LUKER INDEX

Purpose: Hypotheses: (1) a population of delinquents from ages 16 to 40 show maladjustment as measured by the Rotter Incomplete Sentence Blank; (2) there is a similarity in the adjustment of the delinquent group and the maladjustment of the college population; and (3) there is a relationship between counselors' ratings of stages of progress as developed by Dr. Arno Luker and the 12-card sort administered to the client.
Subjects: Population of 25 delinquents on probation being counseled by the Practicum groups of Colorado State College.
Findings: Pretesting as measured by the Rotter ISB showed 65 percent of the delinquents to be maladjusted. The Pearson r correlation revealed a relationship of .61 between the maladjusted of the college population and the maladjusted of the delinquents. Although incomplete, preliminary findings show significant agreement between counselors', supervisors', and clients' ratings. According to the Luker measure, a client passes through 12 stages in gaining self-autonomy. Additional agreement is indicated by the fact that the mean numbers of stages of progress as rated by the counselees was 8.92. The 12-card sort indicated 12 of the clients had completed therapy.
Duration: Spring 1961-June 1962.
Publication plans: University Microfilms.
Principal investigator: Florence Esther Doyle, Ed.D. Candidate, Colorado State College, Greeley, Colo. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)

16-M-3 THE YOUTHFUL DYER ACT OFFENDER: AN ETIOLOGICAL STUDY

Purpose: An attempt to describe the etiology of juvenile auto theft (short-history offender), on the basis of an assumed status problem relating to adult masculinity. A complex questionnaire is being administered, comparing long-history delinquents with short-history offenders.
Duration: Not reported-summer 1962.
Principal investigator: Martin L. Dosick, A.M., Assistant Professor, Southern Illinois University, Carbondale, Ill. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: U. S. Probation and Parole Offices in the Midwest; Federal Bureau of Prisons, U. S. Department of Justice.

16-M-4 DETERMINANTS OF SEX-ROLE IDENTIFICATIONS OF HOMOSEXUAL FEMALE DELINQUENTS

Purpose: To investigate factors responsible for some girls assuming passive roles and other aggressive roles in a homosexual relationship.
Subjects: Sample of 28 aggressive and 23 passive homosexual delinquent girls.
Methods: Rorschach, TAT, DAP, and M-F Scale from MMPI administered. Two checklists were devised, one for use by psychologists and the other for social workers. The former was filled out on the basis of the tests and the latter on the basis of case histories and interviews. Reliability of judges was found significant beyond the .01 level. Frequency of "yes-no" responses was evaluated by Chi-square. Strength of the "yes" responses was evaluated by a t ratio.
Findings: It was found that passive girls perceived their mothers as threatening and that they identified with them. The aggressive girls found fathers threatening and identified with them. All girls were rejected by their mothers and the mother was the dominant person in the family. A conclusion was made that for homosexual behavior to develop, the girl must be rejected by the mother and be in conflict with one or the other parent. An aggressive-dominant mother and passive-indifferent father will tend to create a passive homosexual girl and a passive-inadequate mother and aggressive-dominant (protesting his masculinity) and sexually threatening father will tend to create an aggressive homosexual tendency in girls already weakened by severe rejection.
Publication plans: Possible publication in Journal of Projective Techniques in 1963.
Duration: 1959-May 1962.
Principal investigator: Stephen J. Howard (Ph.D. Candidate, University of Southern California) Clinical Psychologist II, Los Angeles State Mental Hygiene Clinic, Los Angeles, Calif. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)

16-M-5 THE SELF-CONCEPTS OF JUVENILE DELINQUENTS WITH SEXUAL DEVIATIONS

Purpose: To determine if any common self-concept structure exists among juveniles arrested for sex crimes including rape, prostitution, homosexuality, and sodomy. The hypothesis was that a basic self-awareness led to overt denial of sexual mores as a compensation mechanism.
Subjects: 82 cases.
Methods: Complete psychological studies and determination of statistical significance between self-concept and type of aberration.
Findings: Results suggest that an inadequate self-concept (self-sufficiency) is most likely to be expressed by prostitution or homosexual behavior. Rape and sodomy seem to include other personality factors not included in the self-concept structure. More study of these aspects is in progress and will require more data.
Publication plans: Publication planned at termination of project.
Duration: 1953-summer 1963.
Principal investigators: John S. Schell, Ed.D., Clair Saylor, and Mrs. Bertha Bright, Department of Psychology, Edinboro State College, Edinboro, Pa. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating group: Mercer County Courts.

16-M-6 A STUDY OF THE ACCURACY OF THE SELF-CONCEPT OF JUVENILE DELINQUENTS

Subjects: Two groups of delinquents from the District of Columbia institution for delinquents, Cedar Knoll School, and a control group from the Prince Georges County, Maryland, public schools.
Methods: A self-estimate sheet was designed which allowed the subjects to estimate their academic and physical ability as compared to the group of which they were a member. In addition, two social tests allowed the subjects to reflect how they saw themselves as well as how the group saw them. After completion of the self-estimate sheets, the subjects were tested and the number of correct estimates made by each subject was determined for the academic and physical areas. A score was also computed for each of the social tests.

Duration: Not reported-December 1962.
Principal investigator: William E. Amos, Ed.D., Superintendent, Cedar Knoll School, Laurel, Md.

16-M-7 SOCIAL CLASS DIFFERENTIALS IN SELF, VALUE, AND OPPORTUNITY ORIENTATION AS RELATED TO DELINQUENCY POTENTIAL

Purpose: To construct scales dealing with the awareness of limited opportunity theory of Cloward and Ohlin, and the value orientation theory of Cohen, and to relate these two theories and other socialization and self variables to delinquency potential.
Subjects: Approximately 1,500 middle and lower class sixth and ninth grade white and Negro boys and girls, primarily from Columbus, Ohio, but also from California and Kentucky.
Methods: Four questionnaire pretests utilized to build two scales. A final 10-page questionnaire consisting of five scales and groups of items administered to 1,030 Columbus, Ohio, sixth and ninth graders. Subjects selected to give age, race, sex, and social class differentials.
Findings: Significant associations were found between delinquency potential and (1) rejection of middle class values, (2) feelings of limited opportunity or limited chances for success in the future, (3) unfavorable self-concepts, and (4) a low level of interpersonal competence. Sex, age, and class differences have also been found.
Publication plans: Journal publication is anticipated.
Duration: August 1961-August 1962.
Principal investigator: Judson R. Landis (Ph.D. Candidate), Assistant Professor of Sociology, Ohio Wesleyan University, Delaware, Ohio.
Cooperating groups: Ohio State University Delinquency Research Project; Ford Foundation.

16-M-8 VALUES OF HIGH ACHIEVING AND DELINQUENT ADOLESCENTS

Purpose: To determine similarities and differences in values of high achieving and delinquent groups as compared to a group of "average" adolescents.
Subjects: Students in one high school with an enrollment of 1,000.
Methods: Groups selected by a panel of high school administrators. Data gathered by use of questionnaires and interviews.
Publication references and plans: Preliminary findings in Bulletin of Secondary School Principals, November 1961; further findings to be published as part of a forthcoming book.
Duration: September 1959-September 1962.
Principal investigator: Stuart Palmer, Ph.D., Associate Professor of Sociology, University of New Hampshire, Durham, N. H.
Cooperating group: Central University Research Fund, University of New Hampshire.

16-M-9 A CONCEPTUAL FRAMEWORK FOR JUVENILE DELINQUENCY

Purpose: To formulate a conceptual framework for delinquency and a corresponding strategy by examination of the various theories of the nature and etiology of delinquency, theories, for example, of its relation to lower class morality, to the economic level, to a general lowering of moral standards, to a society inured to warfare and to the preparation for warfare.
Duration: May 1962-November 1963.
Principal investigator: Robert M. MacIver, D.Ph., National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.
Cooperating group: National Institute of Mental Health.

16-M-10 TO TEST RECENT AMERICAN THEORIZATION ON DELINQUENCY AND OPPORTUNITY; DELINQUENT SUBCULTURES IN EAST LONDON

Methods: (1) Statistical: analysis and comparison of all indictable and selected nonindictable offenses committed by males and females between the ages of 8 and 25 in two East London boroughs in the year 1959-60. (2) Interview: 100 twenty-one year old males in each borough to be interviewed on the basis of random sample selection from the electoral registers. (3) Participant observation: field work to be carried out in each borough with adolescents, with a view to eliciting their expression of attitudes and values, and in order to observe their scheme of behavior and general social orientation. Material from (2) and (3) will be gathered with the intention of clarifying and adding to information in this country on delinquent subcultures, youth culture, the gang, and the concept of anomie.
Publication references: British Journal of Criminology 1:4:376, April 1961.
Duration: October 1960-December 1962.
Principal investigators: David M. Downes, B.A., and Dr. T. P. Morris, Sociology Department, London School of Economics, London, England. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)

16-M-11 PSYCHOSOCIAL CASE STUDIES OF JUVENILE DELINQUENTS IN THREE SUBCULTURES

Methods: Using the Warner Index of Status Characteristics (validated in the local community) three delinquent youths, each representative of his respective social class were selected for intensive study. Several other delinquent youth, representative of their social class, were selected for less intensive investigation as checks of the extended studies. Three devices were employed in gathering the case study data: (1) Investigator's Guide, patterned after that standardized by the Gluecks; (2) an extensive questionnaire probing the same areas of behavior solicited by the investigator's guide; and (3) a "life history" guide designed to get the subject's own life story as he saw it. Items (1) and (2) were filled out using information provided by persons in contact with the youths such as teachers, police officers, peers, etc.
Findings: It was found that the upper middle and lower class youth did not differ significantly from one another, or from their own observers, but there was a significant difference at the .05 percent level of confidence in the responses when all the delinquent's responses were compared to all the observers' responses. It was concluded that the feelings held by delinquents are relatively the same, but the manner in which these feelings originated was different.
Publication references: University Microfilms.
Duration: Completed 1961.
Principal investigator: John J. Mirich, D.Ed. Candidate, Colorado State University, Fort Collins, Colo. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)

16-M-12 MIDDLE CLASS DELINQUENCY

Purpose: (1) To investigate the delinquency of a sample of middle class high school students; and (2) to test four theories of middle class delinquency. Hypotheses are derived from each theory and are to be tested statistically.
Methods: Anonymous checklist of delinquency items; questionnaire; and interviews.
Publication plans: To be submitted as a doctoral dissertation.
Duration: 1961-1964.
Principal investigator: Edmund W. Vaz (Doctoral Candidate), Department of Sociology, McMaster University, Hamilton, Ont.

16-M-13 MIDDLE CLASS DELINQUENT YOUTH--A STUDY OF FAMILIES

Purpose: To explore the intrafamily relationships and the families' community relationships, in order to understand family patterns and other factors contributing to rebellious and antisocial behavior of youth.

BEST COPY AVAILABLE

Subjects: 100 intact middle class families, each having at least one boy or girl between 13 and 18 years of age who is delinquent or presenting seriously delinquent behavior. For purposes of study, "intact family" implies that parents or parent-surrogates are both present in the home and have a stable marriage of at least three years' duration.
Methods: Diagnostic report and recommendations for treatment, or for management of the delinquent youth, will be made to referring physicians and agencies. A selected number of families studied will be offered appropriate therapy within the University of Texas Medical Center. Examining methods include the team-family method of study and treatment, reported under title Multiple Impact Therapy (Bulletin 5, Research Relating to Children), supplemented by sociological data.
Duration: September 1962-August 1965.
Principal investigators: Harold A. Goolishian, Ph.D., Associate Professor and Chief, Division of Psychology; Eugene C. McDanald, M.D., Associate Professor, Robert MacGregor, Ph.D., Research Director, Mrs. Agnes M. Ritchie, Chief Psychiatric Social Worker, and Alberto C. Serrano, M.D., Psychiatrist, Youth Development Project, University of Texas Medical Branch, Galveston, Tex.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-M-14 FAMILY PATTERNS OF ADOLESCENT LAWBREAKERS

Purpose: Problem: Who, in terms of variables such as geographical mobility, income, stability of home, race, etc., are the official delinquents in San Francisco?
Methods: All available information was coded on all 1960 official San Francisco delinquents. This will be correlated with census data.
Findings: Indicated bi-modal distribution--40 percent from traditionally disorganized home and 40 percent from what appear to be stable middle class homes. Ecological studies will be followed up with intensive interviews and questionnaires.
Duration: February 1961-indefinite.
Principal investigator: Ralph Lane, Jr., Ph.D., Assistant Professor, Department of Sociology and Social Welfare, University of San Francisco, San Francisco 17, Calif. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)

16-M-15 YOUTH RESEARCH PROJECT: DELINQUENCY AND SOCIAL COHESION

Purpose: Hypotheses: Higher juvenile delinquency rates will be found in those areas of a city where: (1) general morale of adults is lower; (2) social distance between generations is greater; (3) accessibility to illegitimate means is higher; (4) accessibility to legitimate means is lower; (5) concern by officials is viewed as less; (6) where the discrepancy between aspiration and achievement is higher; (7) informal neighborhood controls are lower.
Duration: Summer 1961-summer 1962.
Principal investigator: Raymond L. Gorden, Ph.D., Chairman, Department of Sociology and Anthropology, Antioch College, Yellow Springs, Ohio. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: Metropolitan Studies, Inc.; Ford Foundation.

16-M-16 AN INVESTIGATION OF THE RELATIONSHIPS BETWEEN THE QUALITY AND QUANTITY OF JUVENILE ILLEGAL CONDUCT AND AGE LEVEL, COMMUNITY TYPE, SEX, SOCIO-ECONOMIC STATUS AND SEVERAL ATTITUDINAL VARIABLES

Purpose: To measure legally deviant behavior (especially theft) of juveniles by age groups, 11 through 18, and to determine its relationship to types of communities (emphasis on socio-economic class structure), sex, and specific age level. It is hypothesized that differences will be found in nature and extent of illegal conduct depending upon community and sex and age level within these communities, and depending upon the value orientation and attitudes of the respondents.

Subjects: 1,129 public school children in rural, small industrial, wealthy suburban, working class, and very large urban communities.
Methods: In addition to description of theft (what was taken, from where, which persons knew of it at the time, and what was done with the stolen material), instruments were constructed to measure value orientations, feelings of alienation, attitude toward law enforcement, extent of socialization, concept of self as good or bad person, ability to defer gratification, degree of "theft association," extent to which goals are thought to be attainable without conflict with the law, as well as some personal data. Data were gathered by self-administered questionnaires. Guttman-type scaling procedures and multivariate analysis will be used after preliminary examination of the data.
Publication reference and plans: American Sociological Review, December 1962; two other articles submitted for publication.
Duration: April 1961-June 1963.
Principal investigators: John P. Clark, Ph.D., Assistant Professor, and Eugene Wenninger, A.M., Research Assistant, Department of Sociology, University of Illinois, Urbana, Ill. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: Research Board, University of Illinois; Ford Foundation.

16-M-17 URBAN-RURAL DIFFERENTIALS IN DELINQUENCY AND CRIME

Purpose: Hypothesis: Criminal and juvenile court cases and institutional commitments are higher in the urban counties of Iowa than in the rural counties in terms of rates per 10,000 population.
Methods: Data have been used on court cases and commitments from the 99 counties. Counties have been classified according to five groups in terms of size. Data cover a 20-year period for commitments and a 10-year period for court cases.
Duration: 1959-1962.
Principal investigator: Walter A. Lunden, Ph.D., Professor, Department of Economics and Sociology, Iowa State University of Science and Technology, Ames, Iowa. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: Iowa State Board of Control; Iowa State University of Science and Technology.

16-M-18 A STATISTICAL STUDY OF JUVENILE DELINQUENCY IN INDIANAPOLIS, 1948-50, 1958-60

Purpose: To determine: (1) to what extent statistical factors found to be associated with official juvenile delinquency in Indianapolis agree with those found to be associated with delinquency in Baltimore (1940) and Detroit (1950); (2) how differences in the Baltimore and Detroit findings can be reconciled; (3) whether there are additional variables which will provide a clearer picture of the factors associated with juvenile delinquency; and (4) to what extent statistical factors associated with delinquency are consistent over time for the same city.
Methods: Computation of delinquency rates and a set of economic, demographic, and social variables (indices of area characteristics) and the computation of their intercorrelations (zero order correlation coefficients). Factor analysis and multiple regression analysis of these results.
Findings: Preliminary: Although conditions unique to particular cities do appear, the results, in general, indicate a good deal of uniformity among cities (after some necessary corrections are made), and suggest the continuing importance of a relatively small number of housing and economic variables.
Publication references: University Microfilms.
Duration: September 1960-August 1962.
Principal investigator: Roland J. Chilton (Ph.D. Candidate, Indiana University), Assistant Professor of Sociology, Florida State University, Tallahassee, Fla. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: Department of Sociology and Research Committee, Indiana University; Marion County Juvenile Court.

16-M-19 EPIDEMIOLOGIC VECTORS OF DELINQUENCY AND ITS CONTROL

Purpose: (1) To develop a technique that may at the same time be applied to the assessment of the impact of community programs on the incidence of juvenile delinquency and to the acquisition of more precise knowledge than now exists concerning certain epidemiological vectors of delinquency. (2) To study these epidemiological vectors in New York City at a number of different time points. (3) To apply the technique to the assessment of the impact of slum clearance and public housing projects in the decade 1950-60 on juvenile delinquency. (4) To develop the base data for the evaluation of several large scale delinquency prevention programs (e.g., Mobilization for Youth and St. Mary's Park Neighborhood projects).
Duration: 1960-not reported.
Principal investigator: Isidor Chein, Ph.D., Professor of Psychology, New York University, Washington Square, New York, N. Y. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-M-20 RACIAL GROUP MEMBERSHIP AND JUVENILE DELINQUENCY

Purpose: To investigate relationships between racial group membership and juvenile delinquency among white and Negro boys. The ethnic relations and delinquency literature both suffer from a lack of empirical data about the subjective responses of minority group delinquents to their minority group position. Therefore, this project is designed to supply the need for materials that will help to qualify or corroborate current theories in the field of delinquency.
Subjects: White and Negro boys, aged 12 to 14, residents of a State training school in Maryland.
Methods: Data will be elicited by means of both standard and projective interviews. Data will be coded to enable systematic comparisons of the responses of various groups, and to construct typologies of delinquent behavior and of modes of interracial relations, and to relate these areas to each other.
Duration: June 1962-June 1963.
Principal investigator: Bernard E. Segal, Ph.D., Instructor in Sociology, Goucher College, Towson 4, Md.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-M-21 JUVENILE DELINQUENCY AND PUBLIC OPINION

Purpose: An exploratory study to determine the nature of public opinion concerning trends in juvenile delinquency, the major reasons for these trends, and the role of particular situational factors in contributing to delinquency.
Methods: Random distribution of 100,000 questionnaires throughout the 92 counties of Indiana. Study findings are based on data obtained from 19,129 returned questionnaires which offer a fair representation of the Indiana population. The public opinion response for each question has been compared to professional evidence (research findings, statistical data, and/or criminological opinions).
Findings: An informed opinion (defined operationally as concurrence with the professional evidence) is more prevalant than an uninformed one. Significant correlations were found on the basis of cross-tabulations of the data for marital status, age, and sex variables. Two particular interpretations, ego-involvement and social change, are suggested to explain the difference of opinion of respondents of diverse social backgrounds.
Publication references and plans: Presently available as a mimeographed monograph; further publications are planned.
Duration: October 1955-January 1962.
Principal investigator: Gordon J. DiRenzo, M.A., Assistant Professor of Sociology, Fairfield University, Fairfield, Conn.
Cooperating groups: University of Notre Dame; Indiana Governor's Council on Children and Youth; Ford Foundation.

16-M-22 LANE COUNTY YOUTH STUDY PROJECT

Purpose: To study: extent of delinquency in county's rural and small city areas; how it differs from delinquency problem in large cities; potential use of public schools as delinquency prevention centers. Later phase will be directed toward developing a community youth program with dovetailed services in education, employment, recreation, law enforcement, and social services.
Methods: Initially, surveys of delinquents, high school youth, adults, and personnel of community agencies.
Publication plans: Journal articles, monographs, and mimeographed materials are expected.
Duration: August 1962-February 1964.
Principal investigators: Kenneth Polk, Ph.D., Department of Sociology, Edgar Brewer, M.A., and Donald Call, Ph.D. Candidate, University of Oregon, Eugene, Oreg.
Cooperating groups: University of Oregon; Welfare Administration, U. S. Department of Health Education, and Welfare.

16-M-23 MOBILIZATION FOR YOUTH: PREVENTION AND CONTROL OF DELINQUENCY BY EXPANDING OPPORTUNITIES

Purpose: A major experimental and demonstration program to attack the problem of juvenile delinquency in a congested depressed area of the Lower Eastside of New York to provide evidence of the effectiveness of certain activities directed to altering or changing some undesirable social conditions.
Duration: 1959-indefinite.
Principal investigators: James E. McCarthy, Administrative Director, George A. Brager, Action Director, and Richard A. Cloward, Ph.D., Research Director, Mobilization for Youth, Inc. 214 East Second St., New York 9, N. Y.
Cooperating groups: Social, educational, religious and civic institutions; Columbia University; National Institute of Mental Health, Public Health Service, and Office of the Special Assistant, U. S. Department of Health, Education, and Welfare.

16-M-24 IDENTIFYING THE SCHOOL VANDAL

Purpose: (1) Survey of large school systems for background information on numbers, cost, and preventive measures, with regard to school vandalism; (2) study of 64 cases of vandalism over a two-year period, involving 114 subjects who have been identified. Their school records are being analyzed in an attempt to find distinguishing characteristics.
Duration: Spring 1961-spring 1962.
Principal investigators: Rodney E. Nowakowski, Ed.D. Candidate, and Sam Ersoff, Ed.D., Professor of Education, University of Miami, Coral Gables, Fla. (Reported in *Current Projects in the Prevention, Control and Treatment of Crime and Delinquency*, 1962.)
Cooperating group: Miami Board of Public Instruction.

16-M-25 AN INVESTIGATION OF THE INFLUENCE OF THE GUIDANCE PROGRAM OF A JUNIOR HIGH SCHOOL UPON DELINQUENT'S CLASSROOM BEHAVIOR

Purpose: To evaluate guidance programs of New York City junior high schools.
Subjects: Juvenile delinquents in New York City junior high schools.
Methods: Experimentally varied guidance programs offered to junior high school students defined as juvenile delinquents. Statistical computation of differences in scores on behavior rating scales to determine if a significant difference exists following enrollment in any of the varied guidance programs.
Publication plans: Available on interlibrary loan from New York University Library.
Duration: September 1961-August 1962.

Principal investigator: Beverly Lipschitz (Ed.D. Candidate, New York University), Guidance Counselor, P. S. 260, 875 Williams Ave., Brooklyn 7, N. Y.
Cooperating groups: New York University; New York City Board of Education.

16-M-26 DEMONSTRATION COUNSELING PROJECT

Purpose: An experimental program consisting primarily of recreation activity, group and individual counseling. Primary interest will be focused on three areas in the assessment of change: institutional adjustment; interboy relationships (including clique structure); and intrapsychic changes within boys.
Subjects: One cottage of 75 randomly selected boys at the National Training School; second cottage of 75 randomly selected boys following the regular institutional program to serve as control group; third group of 30 boys, scattered throughout the remaining cottages to serve as a secondary control.
Methods: All counseling is done by nonprofessionals selected from the officers of the regular custodial staff. The counselors are supervised in all aspects of the program by professional personnel on the research staff, as well as by outside consultants. Pre- and post-measures will be taken on all groups. Demographic, sociometric, and psychometric measures will be obtained.

Duration: October 1961-1964.
Principal investigators: Robert B. Levinson, Ph.D., Director, Howard L. Kitchener, M.S.W., Co-director, and Donald A. Swicord, M.A., Research Assistant, National Training School for Boys, Bladensburg Rd. and South Dakota Ave., N.E., Washington, D. C. (Reported in *Current Projects in the Prevention, Control and Treatment of Crime and Delinquency*, 1962.)
Cooperating group: Federal Bureau of Prisons, U. S. Department of Justice.

16-M-27 PSYCHOSOCIAL INTERVENTION INTO DEVIANT ADOLESCENT SUBCULTURES

Purpose: Bridging concepts between socio-analytic and socio-cultural theories of emotionally disturbed delinquent children; evolving a treatment program based on a work formulation of the interrelationship of personality and social structures, referred to as the "triple bind."
Subjects: 17 emotionally disturbed adolescents living together in a cottage at Hawthorne Cedar Knolls School, a residential treatment center.
Methods: Participant observation, interviewing, psychometry, clinical assessments, development of experimental film procedures.
Findings: Delinquent boys are caught in a "triple bind." They oppose staff authority by varying forms of subversion. In their own group, through identification with the "aggressor," they create stereotyped, coercive relationships. These two systems reinforce the boys' pathological defenses. An attempt has been made to demonstrate that the gang code evolves from the struggle of the residents against the staff, in the authoritarian management by peers of one another, and that both processes are rooted in each boy's pathological defenses and developmental history. Their interrelationships can be summarized as follows: the boys' conflict with society is qualitatively strengthened by their combinations in the peer culture. They transform individual opposition into collective antagonism to societal norms. In their peer social structure the delinquent leadership imposes severe controls upon compeers. The boys' social system is reinforced through mutually supportive transferences in what is referred to here as a fantasy social system. Society's suppression of the peer group reinforces the entire circular process.
Duration: May 1962-May 1965.
Principal investigator: Howard W. Polsky, Ph.D., Hawthorne Cedar Knolls School, Jewish Board of Guardians, Hawthorne, N. Y.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-M-28 CASEWORK WITH FAMILIES OF INSTITUTIONAL DELINQUENTS

Purpose: A pilot study to determine (1) if parents of boys first admitted to Wisconsin School for Boys would be willing to accept social casework services during period of institutionalization of boys; and (2) if families willing to accept casework services had the ability to use the proferred services. Goal will be to measure effectiveness of attempts to improve the home situation to which the boys will return.
Methods: Information was obtained from the routine statistical reporting of the Bureau of Research and from the process-recording of interviews, using a social data sheet developed for the project. The two factors of "willingness" and "ability" were related to characteristics recorded on the social data sheets.
Publication references: Mimeographed report of findings available from the Bureau of Research.
Duration: June 1960-November 1961.
Principal investigators: John W. Mannering, M.S., Chief, and Paul H. Kusuda, M.A., Social Research Analyst, Bureau of Research, Wisconsin State Department of Public Welfare, 270 State Office Bldg., Madison, Wis.; Hercules M. Porter, Executive Assistant, and Vernon L. Robinson, Research Assistant, Wisconsin Service Association, Milwaukee, Wis.

16-M-29 THE TREATMENT OF FAMILIES OF DELINQUENT ADOLESCENTS THROUGH CONJOINT FAMILY THERAPY

Purpose: To prevent further acts of delinquency and to observe interaction in delinquent families.
Subjects: Families of delinquent adolescents including mother, father, and all children in family 12 years or older.
Methods: Family therapy including psychological evaluations before and after therapy.
Findings: Pilot study suggests possible patterns of change in family interaction following conjoint family therapy.
Duration: September 1961-September 1963.
Principal investigator: Jerome V. Rose, M.D., Research Associate, Mental Research Institute, Palo Alto Medical Research Foundation, 777 Bryant St., Palo Alto, Calif.
Cooperating group: Rosenberg Foundation.

16-M-30 THE EFFECTIVENESS OF GROUP THERAPY IN THE REHABILITATION OF JUVENILE NARCOTIC ADDICTS

Purpose: To test the hypothesis that group psychotherapy is an effective modality in the rehabilitation of juvenile narcotic addicts.
Subjects: Five therapy groups, each consisting of from five to eight inpatients at Riverside Hospital (except for one "mixed" group utilizing nonaddicted college students).
Methods: Each group included a nonparticipating, observer-recorder, and the recording techniques were standardized. Regular seminars were held to discuss the progress of the groups. The presence of integrative and disintegrative forces within the group, of factors which tended to contribute to formation of group cohesiveness, of motivations of individual patients to form a working, therapeutic group and to continue this experience after their discharges from the hospital were all evaluated. These were correlated with such intragroup factors as group composition, personality of group therapist, and internal structure of the group. Several groups showed disintegrative forces early, while others coalesced into working groups which were continued on an outpatient basis. An attempt is being made to assess the significant variables accounting for these differences.
Publication plans: Manuscript for publication in preparation.
Duration: August 1960-completed.
Principal investigators: Arnold Zucker, M.D., Robert Osnos, M.D., Hyman Kachalsky, M.D., David Laskowitz, Ph.D., Ferdinand Jones, Ph.D., and staff, Riverside Hospital, New York, N. Y. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating group: Department of Psychiatry, Albert Einstein College of Medicine, Yeshiva University.

16-M-31 YOUTHFUL OFFENDER STUDY--A REVIEW OF THE PROBLEM OF YOUTH CRIME WITH SPECIFIC REFERENCE TO TREATMENT METHODS AND NEEDS FOR THE YOUNG OFFENDER ABOVE THE STATUTORY JUVENILE COURT AGE

Purpose: Adolescence has always been recognized as a period of great change in the individual's development, a period of new found strength and drives, during which the turmoil and energy of youth often results in aggressive and criminal behavior. This study will explore these behavioral problems, and the ways in which the community and the administration of justice respond, specifically in the methods of handling the treatment of the youthful offender above the statutory juvenile court age. The study will seek to identify treatment needs and suggest patterns of response.
Duration: 1960-1963.
Principal investigators: Milton C. Rector, Director, Sol Rubin, Legal Consultant, and Ben Overstreet, Jr., Consultant, National Council on Crime and Delinquency, 14 E. 23rd St., New York 10, N. Y. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: Advisory and working group of specialists representing the various disciplines concerned (police, courts, probation, detention, institutional treatment, parole, education and community organization); Babcock Foundation.

16-M-32 A STATEWIDE STUDY OF JUVENILE AND ADULT CORRECTIONAL PROGRAMS IN THE STATE OF DELAWARE

Purpose: To take inventory of existing services to juvenile and adult law violators in Delaware, both public and private. The field work revealed much duplication of administrative effort, and a dearth of good correctional services. Hopefully, the study report will provide a blueprint for action in the establishment of an overall administrative agency for governmental services in correction, evaluate the effectiveness and the need for the halfway house program operated by Prisoners Aid Society, and give direction to future programs of the Prisoners Aid Society.
Publication references: Vol. I (Adult Corrections) and Vol. III (Court and Institutional Services for Juveniles) published December 1962; Vol. II (The Prisoners Aid Society) to be published March 1963.
Duration: June 1961-March 1963.
Principal investigators: Willis O. Thomas, Eastern Regional Consultant, National Council on Crime and Delinquency, 44 E. 23rd St., New York 10, N. Y., Austin H. MacCormick, Sc.D., Executive Director, Osborne Association, Inc., 114 E. 30th St., New York 16, N. Y., Charles Shireman, M.A., Assistant Professor, School of Social Service Administration, University of Chicago, Chicago 37, Ill., and Abraham Novick, Superintendent, New York State Girls Industrial School, Hudson, N. Y. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: Delaware Prisoners Aid Society; Citizens Committee on Delaware Corrections; National Council on Crime and Delinquency; Delaware Crime Commission.

16-M-33 FEDERAL YOUTH OFFENDER STUDY

Purpose: Extensive study of persons received from the courts who entered an institution during the first full year of operation under the Federal Youth Corrections Act.
Subjects: 323 committed youth offenders received during the fiscal year which ended June 30, 1955.
Methods: Study consists of four major parts: (1) the offenders themselves; (2) the institution phase of their treatment and training; (3) the parole phase; (4) correlations between the various factors which are tabulated.
Publication references: Annual reports, U. S. Board of Parole, 1958 and 1959.
Duration: July 1954-1963.
Principal investigator: James C. Neagles, A.B., Staff Director, Board of Parole, U. S. Department of Justice, Washington 25, D. C. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)

16-M-34 THE CHARACTERISTICS AND RESPONSE TO TREATMENT OF JUVENILES RELEASED FROM THE REHABILITATION FACILITIES OF THE STATE OF WASHINGTON

Purpose: To obtain information concerning the characteristics, background, time spent within the institutions, and the rate of recidivism of those juveniles who were paroled from the rehabilitation facilities of the State of Washington.
Methods: Specific factors examined were age at date of parole, race, general intelligence, living arrangement prior to commitment, county of commitment, reason for referral, prior record, months spent in residence and months spent on parole. Comparisons were made between recidivists and parolees as a whole.
Duration: October 1961-February 1962.
Principal investigators: Duane W. Sturges, B.A., Research Analyst, and Evan A. Iverson, Ph.D., Chief, Research and Program Analysis Section, Washington State Department of Institutions, Olympia, Wash. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)

16-M-35 EVALUATION OF SOUTHFIELDS, AN INSTITUTION FOR DELINQUENT CHILDREN

Purpose: To compare treatment results of Southfields (an institution modeled after Highfields in New Jersey) with probation and treatment at another institution.
Subjects: Delinquent boys, ages 16 to 18, nonpsychotic, nonbrain-damaged, of at least low normal intelligence, who have no previous record of time spent in a correctional institution.
Methods: Adjudicated delinquent boys are divided into institutional and probationary groups. The institutional group is further divided, half going to Southfields and half to another institution. Groups are to be compared as to recidivism rates. Design worked out to control for selection of groups.
Duration: March 1961-March 1967.
Principal investigator: Lovick C. Miller, Ph.D., Associate Professor of Medical Psychology, Department of Psychiatry and Mental Health, University of Louisville School of Medicine, and Chief Psychologist, Child Guidance Clinic, Inc., 206 E. Chestnut St., Louisville, Ky. (Reported by John F. Ice, M.D., Medical Director, Child Guidance Clinic, Inc.)
Cooperating groups: Jefferson County Juvenile Court; Kentucky State Department of Child Welfare; Ford Foundation.

16-M-36 JUVENILE DELINQUENCY AND THE ADMINISTRATION OF YOUTH JUSTICE

Purpose: To uncover some of the criteria used by police, probation officers, judges, teachers, psychiatrists, etc., in making correctional decisions such as: (1) the definition of the role of the delinquent; and (2) the disposition of specific cases of juvenile delinquency.
Subjects: Official delinquents; official nondelinquents; and the above-mentioned groups.
Methods: Questionnaires.
Publication plans: Will appear in sociological journals, as well as in publications dealing with crime and delinquency.
Duration: Spring 1962-fall 1963.
Principal investigator: Peter G. Garabedian, Ph.D., Assistant Professor of Sociology, Washington State University, Pullman, Wash.
Cooperating group: State of Washington (Initiative Measure No. 171).

16-M-37 A COMPARATIVE ANALYSIS OF AGENTS OF DELINQUENCY CONTROL

Purpose: To describe and compare the orientations to delinquency causation and control among those occupations whose members are concerned with delinquency as part of their work.
Subjects: Police chiefs, juvenile bureau policemen, juvenile probation officers, and juvenile court judges in each of 28 communities in Eastern Massachusetts.

Methods: Data are drawn from taped interviews, attitude scales, sociometric data on relations with other occupational categories, etc. Part of the analysis focuses on differences within occupational categories, part on the differences between them, and part on relations between occupations in different types of communities.
Duration: Spring 1960-summer 1964.
Principal investigator: Stanton Wheeler, Ph.D., Assistant Professor, Department of Social Relations, Harvard University, Cambridge 38, Mass. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: Field Foundation: Ford Foundation.

16-M-38 THE PSYCHOLOGICAL NEEDS OF YOUNG PROBATIONERS

Purpose: Hypothesis: The prognosis for first offenders below the age of 21 can be related to the level of the psychological needs of each offender.
Findings: Initial results indicate that male probationers under 21 demonstrate a relationship between their psychological needs and the behavior demonstrated prior to the criminal offense.
Duration: January 1961-June 1962.
Principal investigators: Paul A. Lane, Ph.D., Associate Professor of Psychology, University of Bridgeport, Bridgeport 4, Conn., and William Hacker, Probation Officer, Connecticut State Department of Adult Probation, Hartford, Conn. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)

16-M-39 A FOLLOW-UP STUDY OF BOYS PUT ON PROBATION

Purpose: To relate subsequent offenses to degree and type of maladjustment and delinquency-proneness as assessed in school.
Subjects: All Glasgow boys under age 15 put on probation for the first time during 1957.
Methods: Maladjustment was assessed by the Bristol Social Adjustment Guide, Day School edition (D. H. Stott and E. G. Sykes, University of London Press, London, 1956); delinquency-proneness assessed by the Delinquency Prediction Instrument (D. H. Stott, as above, 1960).
Findings: To date, the more maladjusted and delinquency-prone are tending to commit significantly more offenses subsequent to probation.
Duration: January 1958-1966.
Principal investigators: D. H. Stott, Ph.D., Lecturer in Psychology, University of Glasgow, A. Sinclair, and D. Wilson, Probation Officers, Glasgow City Probation Department, Glasgow, Scotland.

16-M-40 A STUDY OF FAIRNESS IN JUVENILE PROBATION SERVICES

Purpose: To establish a working definition of "fairness to juveniles;" to determine the feasibility of using the objective approach to study fairness to juveniles by probation officers; and to elicit suitable implications for improving conditions of practice relating to fairness through education and training of officers.
Subjects: Panel of 20 nationally recognized probation experts including judges, administrators, psychiatrists, social workers, and professors (used for validation of suitability of the 21 Criteria of Fairness). Two groups of probation officers from the same agency, 13 and 21 in number, contrasted according to whether or not they were social work-educated (used to select test items which distinguish on basis of a fairness score between social work-educated and nonsocial work-educated probation officers).
Methods: (1) A list of 21 Criteria of Fairness was submitted to panel of experts for appraisal and responses were analysed to produce an "index of acceptability" for each criterion; (2) a 210-item objective test of fairness, based on the Criteria, was given the contrast groups. Comparative responses of each group were statistically analysed

item by item to select items that discriminate between the groups; and (3) using the resultant discriminating items, analysis was made of responses of social work-educated in comparison with "ideal fairness" answers.
Findings: (1) The 21 Criteria were generally acceptable to the panel of experts; (2) 50 of the original 210-items were found to discriminate between the contrast groups of social work-educated versus nonsocial work-educated officers; and (3) in the demonstration study, it was shown that social work-educated officers had better "fairness scores" than nonsocial work-educated in only 60 percent of the discriminating items. Several implications for education and training were found.
Publication references and plans: At present, an abridged report is available upon request from the author. Microfilm available through University of Minnesota Library. An article is in preparation for Federal Probation; other articles are planned.
Duration: May 1960-May 1962.
Principal investigator: Paul Ture Steen (Ph.D. Candidate, University of Minnesota), Executive Director, Community Services Council, 3875 Florida Blvd., Baton Rouge 6, La.

16-M-41 THE INFLUENCE OF SIMILAR SOCIO-ECONOMIC BACKGROUNDS UPON THE EFFECTIVENESS OF THE PROBATION OFFICER ROLE IN THE REHABILITATION OF JUVENILE DELINQUENTS

Purpose: Hypothesis: a Probation Officer will perceive a juvenile as having a good prognosis if their values are not too disparate, and will perceive another juvenile as having a poor prognosis if their values and mobility aspirations are extremely disparate.
Subjects: 35 female Deputy Probation Officers, randomly selected; 70 female juvenile court wards, aged 15 through 17, nominated by the Probation Officers.
Methods: Each officer named one child as having the best prognosis in her caseload and one as having the poorest prognosis. Interviews averaging one and one-half hours each were conducted on a schedule designed to demonstrate the Probation Officer's ingenerational mobility, her professional aspirations, her social values, and a sentence completion test designed to discover covert attitudes. A similar schedule was used for the juveniles. The projective material will receive a reliability check before coding and analysis of data is undertaken.
Duration: August 1960-September 1961.
Principal investigator: Francesca Alexander, Ph.D. Candidate, University of Southern California, Los Angeles, Calif. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: Los Angeles County Probation Department; University of Southern California; Ford Foundation.

16-M-42 PRERELEASE AND AFTERCARE SERVICE

Purpose: A three-year demonstration project designed to provide intensive casework services to a small group of boys and their families while the boys are at the Alabama Boys Industrial School. All applicable community resources are utilized in helping the individual child. It is felt that intensive work with and for the child such as that given in this project will aid in the reduction of continued delinquency and will reduce recidivism. If the project proves successful, hopefully, the institution will be able to incorporate a similar but expanded prerelease and aftercare service to include every child leaving the institution into all parts of the state.
Findings: Evaluation data have not yet been compiled to reflect complete findings but much progress has been apparent.
Publication plans: Present plans are to compile results at the end of the three-year demonstration project and to have these available upon request.
Duration: December 1961-December 1964.
Principal investigators: Alex Darabaris, M.S.S.W., Director of Social Service, and Robert Thompson, M.S.S.W., Social Worker, Alabama Boys Industrial School, Birmingham 6, Ala.
Cooperating groups: Citizens Advisory Committee: Jefferson County Coordinating Council, Family Counseling Association, Jefferson County Juvenile Court, Birmingham City Board of Education, Meyer Foundation, U. S. Probation Office, Alabama State Employment Service, Jefferson County Association of Mental Health, Jefferson County Mental Health Clinic; other individuals and community agencies.

BEST COPY AVAILABLE

16-M-43 FOLLOW-UP ON AFTERCARE STUDY--1959 RELEASES FROM WISCONSIN SCHOOLS FOR BOYS AND WISCONSIN SCHOOL FOR GIRLS

Purpose: To find factors which are related to recidivism of releasees from the Wisconsin School for Girls and Wisconsin Schools for Boys.
Methods: Factors are being reported for each offender released from the training schools. In a later study it is planned to combine the items that are most related to being returned or not into an aftercare experience table.
Publication plans: Publication by Bureau of Research.
Duration: May 1961-March 1963.
Principal investigators: John W. Mannering, M.S., Chief, Paul H. Kusuda, M.A., Social Research Analyst, and Dean V. Babst, Social Research Analyst, Bureau of Research, Wisconsin State Department of Public Welfare, 270 State Office Bldg., Madison Wis. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)

16-M-44 SELECTING ADOLESCENTS FOR FORESTRY CAMP PLACEMENT

Purpose: Initial goal was to improve the weeding out of subjects who adjusted poorly in forestry camps. Amended goal is now to better determine the particular type of receiving institution in which subjects will most benefit, as well as least benefit. The use of such information will supplement present data submitted to a "review board" which makes individual dispositions, but will be more generally used after long-term refinement.
Subjects: All juvenile males 14-0 years and over who were sent to youth forestry camps from the diagnostic center at Ft. Worden.
Methods: Boys were administered the IPAT High School Personality Questionnaire while at the center. Later, at the forestry camps to which they had been sent, the boys were rated on 25 dimensions gleaned from a list of 54 behavioral areas by rank ordering by camp counsellors. The average rating of 8 to 12 raters was then correlated with the HSPQ factors. These correlations were then used to predict ratings on other ratees.
Findings: Tentative findings suggest that some, but not all, of the HSPQ factors correlate with some of the scales, and that use of all factors in various specification equations look promising on prediction of at least eight rating scales.
Publication plans: Initially, a report to Washington State Bureau of Juvenile Rehabilitation, mimeographed copies of which will be available later in the year. HSPQ normative and validating material, and/or rating reliability studies may be published later in a journal.
Duration: March 1961-September 1962.
Principal investigators: Robert Folkes Kelly, M.A., and Vernon O. Tyler, Jr., Ph.D., Clinical Psychologist, Ft. Worden Center, Port Townsend, Wash.
Cooperating group: Institutions within the Washington State Bureau of Juvenile Rehabilitation.

EDUCATIONAL PROCESS

General

16-N-1 A STUDY OF VALUES OF HIGH SCHOOL STUDENTS AND THEIR TEACHERS

Purpose: (1) To determine if personal and occupational values of students change during the high school years; (2) to find the extent to which communications between teachers and their students are affected by value patterns.
Subjects: 3,000 high school freshmen and 300 freshmen teachers in 10 central California high schools. These same students will continue in the study as sophomores and as seniors.
Methods: Each year students complete a personal information form, the Differential Values Inventory (Richard Prince, University of Chicago), and Occupational Values Inventory developed from an instrument used by R. Centers (The Psychology of the Social Classes). Teachers of these students complete the above forms and also Study of Values (Allport-Vernon-Lindzey).
Publication plans: Plans are to publish resumés in various educational journals during the study.
Duration: September 1962-June 1966.
Principal investigator: Orville E. Thompson, Ph.D., Associate Professor, Department of Agricultural Education, University of California, Davis, Calif.
Cooperating group: Cooperative Research Program, Office of Education, U. S. Department of Health, Education, and Welfare.

16-N-2 STUDY OF PUPIL MOBILITY IN NEW YORK CITY

Purpose: To analyze mobility patterns in each school group resulting from pupil migrations to and from places outside New York City and from the intracity movements of the school population. To identify school districts with high and low mobility rates. To study the size, composition and direction of pupil movements in school districts having high mobility rates.
Subjects: Public school population, kindergarten through grade 12, by school group and borough.
Methods: Statistical analysis.
Duration: September 1959-June 1963.
Principal investigator: Bureau of Educational Program Research and Statistics, New York City Board of Education, 110 Livingston St., Brooklyn 1, N. Y.
Cooperating group: Bureau of Attendance, Division of Child Welfare, New York City Board of Education.

16-N-3 FACTORS IN EDUCATIONAL ASPIRATION AND ACHIEVEMENT

Purpose: To investigate social and social-psychological factors which are related to differences in the educational aspirations and achievements of youth. More specifically, aims are: (1) To investigate the relationship between the educational plans of a large probability sample (10,000 cases) of Wisconsin high school seniors, and socio-economic status, intelligence, rural-urban background, sex, and selected other factors in the family situation, school environment, and community. Multivariate analysis procedures will be employed to determine the relationship of these variables to educational aspirations. (2) To study the sources of variation in educational aspiration and achievements within socio-economic classes, using variables referred to above. (3) To select and follow a group of high ability students over a five-year period to determine relationship between socio-economic status, other background characteristics and, for those who go on to college, the kinds of colleges they attend, academic success in college, and future occupational aspirations; for those who do not go on to college, their entry into the

job market, their beginning career patterns and job and life adjustments. (4) To study intensively a group of students in one school system to obtain information on the operation of the decision process as it involves the decision to continue education beyond high school. (5) To study intensively the career patterns of a small sample of high ability girls.
Duration: 1962-1967.
Principal investigators: William H. Sewell, Ph.D., Professor of Sociology, and Oluf M. Davidsen, Assistant Registrar and Lecturer in Education, University of Wisconsin, Madison 6, Wis.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-N-4 SOCIAL FACTORS IN EDUCATIONAL ACHIEVEMENT AND ASPIRATIONS AMONG NEGRO ADOLESCENTS

Purpose: To study factors associated with the variation in educational performance of Negro students in the Southern states, and to study antecedents and correlates of educational aspirations among Negro youth in selected Southern communities.
Methods: The first part of the study will use the county as the unit of analysis. Indices of educational performance will be constructed from such components as dropout rates and age-grade retardation. Information available from census reports will be introduced in an attempt to discover sources of variation in these performance rates. Purpose will be to devise a regression formula that explains performance variation. Second part will undertake to determine current educational plans and needs of Southern Negro youth and to increase our understanding of the sources of educational aspiration. Interview and questionnaire information will be obtained from parents and students at the high school level in communities selected to represent the range of educational performance as determined by the first part of the study. It is expected that high educational aspirations are related not only to types of parent-child relationships but to certain expectations concerning future opportunity structures and patterns of race relations.
Duration: 1958-1962.
Principal investigators: Charles E. Bowerman, Ph.D., Chairman, Department of Sociology and Anthropology, and Research Professor, Institute for Research in Social Science, and Ernest Q. Campbell, Ph.D., Associate Professor of Sociology and Research Associate, Institute for Research in Social Science, University of North Carolina, Chapel Hill, N.C.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-N-5 RELATIONSHIP BETWEEN SCHOOL-COMMUNITY COORDINATING PROCEDURES AND EDUCATIONAL MOTIVATION AND BEHAVIOR OF SCHOOL CHILDREN

Purpose: General question to be explored: What conditions of interaction between the school, the family, and the neighborhood account for variations in educational motivation and school behavior? To this end, crucial family types, neighborhood types, administrative styles, and mechanisms of coordinating school-community relations have been defined. These variables taken together are formulated so as to make a prediction of children's educational motivation and school behavior under the following general hypothesis: optimum social control (educational motivation) will result when coordinating mechanisms develop that balance of relationships between bureaucratic organizations (schools) and external primary groups (family and neighborhood) that is at a midpoint--not too intimate and not too distant. From this general hypothesis, limited and specific hypotheses have been specified to deal with the variety of families and neighborhoods the school must confront in such populations as Southern white migrants, unemployed dissolving families, middle class professional families, etc.
Duration: August 1962-August 1965.
Principal investigators: Eugene Litwak, Ph.D., Associate Professor of Social Welfare Research, and Henry J. Meyer, Ph.D., Professor of Social Work and Sociology, University of Michigan, Ann Arbor, Mich.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-N-6 MENTAL HEALTH CONSULTATION IN PUBLIC SCHOOLS

Purpose: To conduct an inservice training program for school administrative personnel in using consultation as a resource for the early discovery and management of problems of pupil behavior, staff adjustment, and parent guidance, and concurrently to evaluate the methodology and outcomes of the program. Specifically: (1) to improve resources for discovering and managing problem situations in order to avoid the development of destructive behavior, unproductive relationships and procedures, and increases in mental health problems; (2) to clarify concepts and procedures of collaboration among school and related personnel toward solving mental health problems; and (3) to broaden the authority concept and leadership techniques of key individual school figures and principals.
Methods: Program will consist of an overlapping series of two-year institutes, workshops, and supervised field consultation experiences for small groups of school personnel, particularly school principals. Evaluation will be accomplished by before-and-after measurements, periodic review by eminent authorities in mental health and education, and analyses of the continuous documentation of the work.
Duration: January 1962-December 1965.
Principal investigators: Irene C. Hypps, Ph.D., Assistant Superintendent, Department of Pupil Appraisal, Study and Attendance, District of Columbia Public Schools; Robert G. Kvarnes, M.D., Executive Director, Washington School of Psychiatry, Arnold Peterson, Ph.D., Clinical Psychologist, St. Elizabeth's Hospital, U. S. Department of Health, Education, and Welfare, Washington, D. C., and Stanley Jacobsen, M.A., Supervisor of Psychological Services, Prince Georges County Board of Education, Upper Marlboro, Md.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-N-7 MENTAL HEALTH PROJECT FOR INDIAN BOARDING SCHOOLS

Purpose: A seven-year study to include: an epidemiological study of mental illness incident in a boarding school population; consultative services to key personnel working with these children both in the schools and to the field personnel; stimulation of a variety of methods and activities on behalf of the mentally ill.
Subjects: 1,200 off-reservation Indian boarding school students of the Northern plains.
Methods: A clinical research team consisting of psychiatrist, clinical psychologist, psychiatric social worker and social scientist based at the Flandreau Indian Vocational High School with field units of psychiatric social worker and public health nurse at Flandreau and the boarding grade schools at Pierre and Wahpeton, North Dakota. The research and field units would collaborate concurrently with existing Federal, State, local, and private agencies in the study, diagnosis, and treatment of the problem areas with recommendations for implementing corrective procedures.
Duration: 1962-1966.
Principal investigators: Thaddeus P. Krush, M.D., Clinical Director, Community Services, Nebraska Psychiatric Institute, Omaha, Nebr., and John W. Bjork, Clinical Social Worker, Public Health Service Indian School Health Center, Flandreau, S. Dak.
Cooperating groups: State University of South Dakota School of Medicine; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-N-8 INFLUENCE OF TYPE OF SCHOOL ON INDIAN PERSONALITY

Purpose: (1) To compare effects of the boarding school and the day school upon Indian students--the immediate effects in terms of behavior and attitudes of students presently enrolled in both types of schools and long-range effects in terms of behavior and attitudes of adult graduates of both types of schools. (2) To study attitudes of Indian families toward the day school and the boarding school. (3) To study some effects of institutional living upon personality. (4) To secure and provide data for those formulating Indian education policy.

Subjects: Navaho, Hopi, and Papago Indians who are attending or have attended either day schools or boarding schools.

Duration: March 1962-March 1964.

Principal investigators: Robert A. Roessel, Jr., Ed.D., Assistant Professor of Education, and Director, Indian Education Center; Gerard V. Haigh, Ph.D., Associate Professor of Psychology, and Bruce S. Meador, Ph.D., Assistant Professor of Education, Arizona State University, Tempe, Ariz.

Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-N-9 FORMAL EDUCATION IN AN AMERICAN INDIAN COMMUNITY

Purpose: Within the context of a Sioux Indian community, research will be oriented about the following types of questions: What role do Indian young people see formal education as playing in their careers and lives? What role do their educators see it as playing? By what patterns of interaction are these notions of "education" and "educability" communicated between teachers and students? How, and to what extent, do leaders of community opinion affect what occurs in the schoolroom and the educational ambitions of Indian young people?

Methods: Classroom interaction in the primary grades will be observed and analyzed. Semi-structured interviews will be conducted with a sample of 100 Indian children, aged 13 to 21, and with all administrators and a large sample of teachers in the school systems serving the community. Significant elders in the families of children both attending and not attending school will be interviewed in unstructured fashion.

Duration: August 1962-July 1963.

Principal investigators: Murray Wax, Ph.D., Associate Professor of Sociology, Anthropology, and of Teacher Education, Rosalie H. Wax, Ph.D., Research Associate, Department of Sociology and Anthropology, and Gerald OneFeather, Research Assistant, Emory University, Atlanta 22, Ga.

Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-N-10 AN EVALUATION OF THE "OPEN ENROLLMENT" AND "SCHOOL UTILIZATION" PROGRAMS

Purpose: To evaluate effect of programs upon pupil achievement in reading, pupil acceptance by receiving schools, and pupil satisfaction in the new school situation.

Subjects: Third, fourth, and fifth grade pupils participating in the programs.

Methods: Administration of achievement, attitude, and sociometric tests.

Duration: December 1960-not reported.

Publication references: Interim report issued in 1962.

Principal investigator: Joseph Justman, Ph.D., Acting Director, Bureau of Educational Program Research and Statistics, New York City Board of Education, 110 Livingston St., Brooklyn 1, N. Y.

16-N-11 THE EXTENT AND EFFECTIVENESS OF THE CONTRIBUTIONS OF A NURSERY SCHOOL TO THE DEVELOPMENT OF PRESCHOOL AGE CHILDREN

Purpose: To determine the appropriateness of behavioral adaptations of young children in a specialized nursery school where modes of management are individually suited.

Subjects: All children enrolled at the Early Childhood Center of Brooklyn College since 1960.

Methods: Assessment of six areas of behavior from annual summary records made by teachers on each child. Longitudinal case studies.

Duration: September 1961-undetermined.

Principal investigators: Clara Loomanitz, M.A., Director, Early Childhood Center, and Pearl Meissner, Ph.D., Professor, Department of Psychology, Brooklyn College, City University of New York, Brooklyn 10, N. Y.

16-N-12 A FIELD DEMONSTRATION OF THE EFFECTIVENESS AND FEASIBILITY OF EARLY ADMISSION TO SCHOOL FOR MENTALLY ADVANCED CHILDREN

Purpose: To demonstrate effectiveness and feasibility of early admission to school for mentally advanced children and to assess the impact of this procedure on the community, school organization (especially the classes and teachers involved with these children), and children themselves.
Subjects: A group of preschool children surpassing a number of criteria levels (intellectual, social, emotional, and physical) selected in each of the three years of this study.
Methods: Initial selection procedures using Binet, Goodenough, Vineland Social Maturity Scale, rating scales and parent interview. Regular interviews with community leaders, teachers and parents for assessment of attitudes. Regular observations of children's behavior.
Findings: In the first year, the examinations of 246 preschool children, from 3-9 to 4-8 years of age, produced recommendations for early admission for 26 children. Parents withheld permission for 7 of these children to be admitted. The other 19 are distributed among the six kindergartens in Warren, Pennsylvania, and all have adjusted adequately or better to the group. The community to date has displayed a high level of interest in and cooperated with the project. Maximum publicity has been given--press, radio, TV, addresses to professional and parent organizations.
Duration: November 1961-October 1964.
Principal investigators: Jack W. Birch, Ph.D., Chairman, and W. David Barney, Ph.D., Visiting Research Professor, Department of Special Education and Rehabilitation, University of Pittsburgh, Pittsburgh 13, Pa.
Cooperating groups: Pennsylvania Department of Public Instruction; Warren Public Schools Board of Education; Office of Education, U. S. Department of Health, Education, and Welfare.

Achievement, aptitude, and school adjustment

16-O-1 PATTERNS OF ACHIEVEMENT AMONG COLLEGE-BOUND STUDENTS

Purpose: In order to establish a sounder basis for the development of improved instructional programs and guidance services for above-average students, this study will (1) attempt to determine the extent to which there are identificable patterns of achievement, such as among the college-bound; (2) analyze discernible patterns of achievement in relation to critical characteristics of students and schools.
Subjects: Some 1,500 seniors in 10 school districts.
Methods: Data for study will be collected from cumulative records. Longitudinal profile charts will provide the basis for visual determination of developmental patterns. Various tests of significance will be used in analyzing the constancy and variability of patterns at different grade levels and in identifying the predominant or distinctive patterns in different schools.
Principal investigators: Walter Reiner, Principal, Pearl River High School, Pearl River, and Charles M. Armstrong, Division of Research, New York State Education Department, Albany, N. Y.
Cooperating group: Research Offices, New York State Education Department.

16-O-2 ABOVE-AVERAGE INTELLIGENCE TEST SCORES AND SCHOOL ACHIEVEMENT

Purpose: To determine which I.Q. tests are most useful for identifying gifted children, assigning them to suitable educational programs, and predicting school achievement.
Subjects: 24 elementary and 24 high school students of above-average intelligence--as measured by the Lorge-Thorndike group intelligence test.
Methods: Students will be tested individually with both the WISC and Stanford-Binet (L-M) scales with an interval of two to three months between testings. To control the effects of practice and the time differential, the sequence of the tests will be reversed for half of the pupils. Total scores for each of the three tests (Lorge-Thorndike, WISC,

and Stanford-Binet), scores on subscales (e.g., WISC Verbal), and distributions of these scores will be compared, and their relationship to such variables as school achievement, grade, and sex will be determined utilizing Chi-square, t ratio, and analysis of variance.
Duration: Not reported-September 1965.
Principal investigator: Bert Friedman, Ph.D., School Psychologist, Ballston Spa Central Schools, Ballston Spa, N. Y.
Cooperating group: Research Offices, New York State Education Department.

16-0-3 IMPROVING THE ACHIEVEMENT OF BRIGHT UNDERACHIEVERS

Subjects: Bright underachievers in grades 4, 8, and 10.
Methods: This program, based on a pilot study of factors in underachievement (Bulletin 15, Research Relating to Children), will involve (1) identification of bright underachievers by a systematic survey using data processing techniques; (2) the conduct of inservice training classes for guidance counselors who will work with underachievers, their parents and teachers; (3) organization of counseling groups for underachievers and for their parents and teachers; and (4) evaluation of the success of group counseling and comparison of achievement of participants with that of control pupils outside the groups. Multiple regression will be used in isolating factors in underachievement and identifying immutable and amenable characteristics of underachievers.
Principal investigators: Byron B. Williams, Ph.D., Director, Office of Field Services, and John A. Schmitt, Ed.D., Research Consultant, College of Education, University of Rochester, Rochester 20, N. Y.
Cooperating group: Reserach Offices, New York State Education Department.

16-0-4 A STUDY OF SOME UNDERACHIEVERS IN PERSHING JUNIOR HIGH SCHOOL

Purpose: (1) To attempt to determine why pupils being studied are underachieving; (2) to determine whether the work with them is helpful; (3) to see if there are procedures which could be suggested for other cases; and (4) to explore means to help other teachers understand the problem of underachievement.
Subjects: Pupils whose I.Q.'s are 120 and above, and whose marks are comparatively low.
Duration: September 1962-June 1963.
Principal investigators: John A. Ratliff, Ed.D., Principal, and staff, Pershing Junior High School, 7000 Braes Blvd., Houston 25, Tex.

16-0-5 STUDY OF PERCEPTUAL AND BEHAVIORAL FACTORS HYPOTHESIZED AS RETARDING SCHOLASTIC ACHIEVEMENT

Purpose: To study the interrelationships between the learner's psychological and behavioral variables and the learning situation variables for high aptitude-low achievement fifth gaade students. General hypothesis: low achievers will differ significantly from high achievers in their perceptual motivational self-structures (psychological variables), classroom behavior and performance (behavioral variables), and the degree of compatibility (degree of convergence) of these with assigned learning tasks, teacher role and expectations, and media of instruction used.
Subjects: Phase 1: 15 high aptitude-low achievement fifth graders and 15 high aptitude-high achievement fifth graders. Phase 2: 60 to 80 high aptitude-low achievement fifth graders in six fifth grade classrooms and 60 to 80 high aptitude-high achievement fifth graders in six fifth grade classrooms.
Methods: Phase 1: through intensive testing, observing, and interviewing, identification of those variables which most significantly differentiate the high aptitude-low achievers from the high aptitude-high achievers. Phase 2: through differential feedback to experimental and control teachers, of information about high aptitude-low achieving pupils concerning variables deemed significant in Phase 1, assessment of differences in individual achievement of pupils as teachers plan school experiences in line with their self-structures.

Duration: October 1962-August 1963.
Principal investigators: Hugh V. Perkins, Ph.D., Professor, and Richard M. Brandt, Ed.D., Associate Professor, Institute for Child Study, University of Maryland, College Park, Md.

16-0-6 NONINTELLECTUAL CORRELATES OF ACADEMIC ACHIEVEMENT BETWEEN ACHIEVING AND NONACHIEVING SPANISH-AMERICAN SECONDARY SCHOOL CHILDREN

Purpose: To investigate personality, home, and other variables related to academic achievement.
Subjects: Groups of Spanish-American high school boys and girls, matched on I.Q., economic status, and academic class. Groups differed significantly (.01 level) in grade achievement.
Findings: Under- or nonachievers are more hostile, less able to handle anxiety, and cannot initiate and sustain positive work habits. Mothers differ in demands placed on offspring.
Publication references: Journal of Educational Psychology.
Duration: Spring 1961-completed.
Principal investigator: Lois Jean Gill (Ph.D. Candidate), Counselor, West Denver High School, Denver, Colo.

16-0-7 EFFECT OF PUPIL TRANSIENCY ON PUPIL ACHIEVEMENT

Purpose: To measure effect of pupil transiency on pupil achievement (skills, knowledges, attitudes, personality traits).
Subjects: Experimental (high turnover) schools--third and sixth grade (high, middle, low ability class); control (low turnover) schools--third and sixth grade (high, middle, low ability class).
Methods: Identification of schools showing high and low turnover--basic data gathered from 1,101 forms submitted by each elementary school during 1958-59 school year. Identification of characteristics of the transient population in schools with high and low turnover--code developed for recording cumulative data (record card, test card, health card). Analysis of relative pupil performance in schools with high and low turnover with analysis sheet for each child--atypical data recorded verbatim wherever available. Analysis of teacher and supervisor opinion concerning effect of high turnover.
Duration: September 1959-February 1963.
Publication plans: A final report will appear during 1963.
Principal investigator: Bureau of Educational Program Research and Statistics, New York City Board of Education, 110 Livingston St., Brooklyn 1, N. Y.

16-0-8 INFLUENCE OF CLASSROOM GROUP COHESIVENESS ON LEARNING AND ADHERENCE TO STANDARDS

Purpose: To investigate the influence of group cohesiveness on learning of specific content material and on adoption of standards relevant to the general pursuit of knowledge.
Subjects: Fourth and fifth graders.
Duration: August 1962-February 1964.
Principal investigators: Albert J. Lott, Ph.D., Associate Professor of Psychology, University of Kentucky, Lexington, and Bernice Lott, Ph.D., Professor of Psychology, Kentucky State College, Frankfort, Ky.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-0-9 YOUTH DEVELOPMENT THROUGH GROUP METHODS IN THE CLASSROOM

Purpose: To adapt and develop group methods applicable to the classroom, to train teachers in their use, to evaluate the effectiveness of such training, and to test its effectiveness on the prevention of maladjustment and delinquency among the pupils of these teachers.

Subjects: 60 sixth grade teachers from the Kansas City, Missouri, public schools and all of the children in their classrooms.
Methods: Subjects divided into two groups of 30 teachers each. Group A has already received three weeks' training in a workshop during the summer. During this school year, Group B serves as control. Both groups receive pre- and post-testing on the Minnesota Teacher Attitude Inventory, Firo-B, Rokeach Scale, and a content test. Each teacher will also be observed in classroom regularly during the school year using adaptation of the Flanders Interaction Categories, Oscar Instrument, and unstructured observations. Next year, Group B will receive training and be observed again. At the end of four years, the children in all of these rooms will be assessed in a follow-up study for adjustment and delinquency.
Duration: January 1962-January 1966.
Principal investigator: Paul H. Bowman, Ph.D., Department of Prevention, Psychiatric Receiving Center, Greater Kansas City Mental Health Foundation, 2200 McCoy, Kansas City, Mo.
Cooperating groups: Kansas City Public School System; University of Missouri; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-0-10 CLASSROOM INTERACTION, PUPIL ACHIEVEMENT AND ADJUSTMENT IN TEAM TEACHING AS COMPARED WITH THE SELF-CONTAINED CLASSROOM

Purpose: To determine whether multi-grade team teaching classroom organization makes a difference in pupil achievement, adjustment or classroom interaction when compared to classes taught in a traditional self-contained classroom.
Subjects: 525 elementary school pupils--350 pupils in grades one to six at Washington School and 175 pupils in grades one to six at Longfellow School. In the Washington School, there are two sections at each grade level with about 30 pupils per class. Experimental design will separate the pupil population, grade by grade, into an experimental group and control Group A, with children assigned to one group by use of a table of random numbers. Control Group B will be made up of the pupils at Longfellow School.
Methods: All groups will be stimulated by University consultants and the introduction of new teaching aids in an attempt to counteract the Hawthorne effect. Control Group B will be used to evaluate possible contamination of variables between the experimental group and control Group A at Washington School. Great care will be taken to introduce bias in the selection of staff for this study. Only strong advocates of a multi-grade team teaching organization and a self-contained classroom organization, who are highly skilled teachers, will be employed. Achievement tests, pupil adjustment tests, and interaction analysis will be made. Appropriate statistical analysis will be made of the data to determine any significant differences between the two types of classroom organization.
Duration: 1960-1963.
Principal investigator: Philip Lambert, Ph.D., Professor, School of Education, University of Wisconsin, Madison 6, Wis.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-0-11 APPRAISAL OF TEAM TEACHING IN ELEMENTARY SCHOOLS

Purpose: To determine effects of team teaching and (1) quantity and quality of children's learning; (2) teacher competence and effectiveness; (3) recruitment and retention of teachers; and (4) home-school-community relationships.
Subjects: Six schools, representing all boroughs except Richmond and a variety of socio-economic backgrounds. In each school, three to seven classes, grades three, four, or five.
Methods: Planning with the schools to set up such teams as will best utilize the specific talents of their teachers. The project coordinator from the Elementary Division will cooperate with principals and other supervisors in assisting teachers, solving problems, evaluating on-going programs. During 1962-63, the projects will consist of tryout rather than controlled experimentation. The design for formal evaluation will be formulated at a later date.
Duration: November 1961-indefinite.
Principal investigators: Catherine Urell, Ph.D., Research Associate, Bureau of Educational Research, and Helene M. Lloyd, Assistant Superintendent, Elementary School Division, New York City Board of Education, 110 Livingston St., Brooklyn 1, N. Y.

Cooperating groups: Elementary School Division; Bureaus of Educational Research, Curriculum Research, and Educational Program Research and Statistics; Audio-Visual Instruction; New York City Board of Education.

16-0-12 AN INTEGRATIVE APPROACH TO CLASSROOM LEARNING

Purpose: Contemporary education is experiencing conflict between opposing forces--emphasizing teaching "fundamentals" versus "the whole child" approach. However, both educational and personality theory predict that there is a constellation of classroom conditions which will foster both intellectual and social-emotional growth. This global hypothesis will be tested by measuring a number of dimensions through two standardized procedures.
Subjects: Pupils in 40 to 60 elementary classrooms.
Methods: Pupil measures (selected to reflect mental health) of creativity, reading, arithmetic, anxiety or dependence-proneness, attitude, motivation, and group skills will be taken, and the means correlated with the classroom measures. The correlation matrix will then be factor analized. Both classroom and pupil measures will be taken a second [illegible] - so that more subtle aspects of pupil growth can be tested by analysis of variance, using categories of classroom conditions as treatments. Teacher personality and pupil personality will also be studied in relation to teacher-pupil behavior and pupil change. A training experience designed to promote self-insight, sensitivity and skill in working with others will be offered to a subgroup of teachers during the intervening summer and change will be assessed by factor scores derived from the earlier analysis.
Duration: July 1962-June 1966.
Principal investigator: Robert S. Soar, Ph.D., Associate Professor, School of Education, University of South Carolina, Columbia, S. C.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-0-13 EVALUATION OF THE EARLY IDENTIFICATION AND PREVENTION PROGRAM

Purpose: To determine the impact of the experimental program in pupil development and teacher growth.
Subjects: Beginning second grade pupils with behavioral and learning problems.
Methods: Experimental and control groups will be measured, rated, and observed. The matched pair technique and/or analysis of variance method will be used to treat the data. In order to gather objective evidence about the effectiveness of the experimental program, a pilot evaluation was begun in the fall of 1961. Initial and final tests of reading and arithmetic achievement were administered to about 750 children in the second grade. Screening forms for behavioral and learning problems were distributed to three experimental and two control schools. Special questionnaires were constructed and distributed to participating principals and teachers to secure their reaction to the program.
Duration: September 1961-1963.
Principal investigators: George Forlano, Ph.D., Acting Assistant Director, and Julia A. Martin, M.S., Assistant in Research, Bureau of Educational Research, New York City Board of Education, 110 Livingston St., Brooklyn 1, N. Y.
Cooperating group: Division of Child Welfare (Bureaus of Child Guidance and of Educational and Vocational Guidance) and Elementary School Division, New York City Board of Education.

16-0-14 THE DEVELOPMENTAL BASIS OF LEARNING DISABILITY

Purpose: To examine a series of hypotheses concerning the physical substratum of classroom learning difficulties.
Subjects: 200 fourth graders chosen from a pool of 1,200 by individual scrutiny.
Methods: Longitudinal; inferential.
Duration: 1961-1963.

BEST COPY AVAILABLE

Principal investigator: Thomas E. Jordan, Ed.D., Director, Center for Teacher Education, Tulane University, New Orleans 18, La.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-0-15 COOPERATIVE GUIDANCE STUDY

Purpose: An experimental study of the effectiveness of early identification and guidance of children with learning problems in the prevention or remediation of major adjustment and learning problems.
Subjects: 1,078 fourth grade children in 11 public school systems in West Central Wisconsin were tested. Of these, approximately 180 students were identified as underachievers, a term used here to describe a child whose achievement level on the Iowa Test of Basic Skills was conspicuously below a predicted level of attainment as indicated by the Wechsler Intelligence Scale for Children.
Methods: Subjects identified as underachievers have been divided into experimental and control groups. The control group will not be formally guided at any time and will receive only those services normally administered by the local schools. The experimental group of underachievers is receiving intensive diagnostic study and guidance from the research team during their fourth, fifth, and sixth grade years. Follow-up will continue through high school graduation.
Duration: Fall 1961-June 1970.
Principal investigators: John C. Cleveland, M.S., Assistant Professor, and Robert M. Jackson, Ph.D., Associate Professor, Department of Psychology, Wisconsin State College, La Crosse, Wis.
Cooperating group: Research Advisory Council, Wisconsin State College.

16-0-16 INDICATORS OF MALADJUSTMENT IN JUNIOR HIGH SCHOOL BOYS

Purpose: To relate measures of maladjustment and aggressiveness in preadolescent males. Secondary purpose, to determine agreement between teachers' classifications of students' aggressiveness and the questionnaire responses of students.
Subjects: 117 boys in sixth, seventh, and eighth grades of a public school in a small Southern city.
Methods: Instruments administered to small groups of students: Buss Hostility Scale (inventory measuring aggressiveness in various areas); bipolar ratings of 20 personality characteristics (subjects rating themselves as they are and as they would like to be. A self-ideal discrepancy score, as a measure of dissatisfaction with present self-concept derived from the self-rating); modified form of Philosophy of Human Nature Scale, (Likert-type scale dealing with positive and negative aspects of human nature). Teachers were asked to classify each boy as Aggressive-Bad (e.g., disruptive, unruly, etc.), Aggressive-Good (active, leading, etc.), or Passive (quiet, unassertive, etc.).
Findings: No significant differences between grades were found. Across and within grades, significant relationships were found between conceptually different measures of maladjustment. Teachers' classifications of students' aggressiveness were found to be related to self-ideal discrepancies and negative views of human nature.
Duration: September 1961-March 1962.
Principal investigators: Walter Collins, Ph.D. Candidate, and Lawrence S. Wrightsman, Jr., Ph.D., Assistant Professor of Psychology, George Peabody College for Teachers, Nashville 5, Tenn.
Cooperating group: Fellowship grant from National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-0-17 A FOLLOW-UP STUDY OF CHILDREN REFERRED TO COUNSELING SERVICE BECAUSE OF AGGRESSIVE, ACTING-OUT BEHAVIOR IN KINDERGARTEN, FIRST, SECOND, AND THIRD GRADES DURING ACADEMIC YEARS 1956-1957, 1957-1958, and 1958-1959

Purpose: This is the fourth in a series of follow-up studies requested by the School Social Work Department of the Tacoma Public Schools. Its purpose is to describe children referred for aggressive, acting-out behavior at two different points in time to provide a better understanding of the possible causes and manifestations of such behavior, and the possible means of resolving this problem.
Subjects: 35 children in Tacoma public elementary schools who had earlier been referred to the Social Service Department of the Tacoma Public Schools with aggressive, acting-out behavior (as assessed by the teacher and/or the school social worker) as the chief referring problem. Subjects, or their parents, had subsequently received at least one face-to-face interview with the school social worker, and their cases had been closed since January 1, 1960.
Methods: Two schedules were designed for data collection--one for recorded information in social case records and school records, the other for a structured interview with the teacher, with factors from the first schedule included wherever practical.
Findings: Partial findings: (1) More males than females were referred, at a ratio of four to one; (2) a majority of subjects were of normal or above average intelligence; (3) a large segment of the sample consisted of children who were the oldest in their families or who were only children; (4) subjects came, for the most part, from families which displayed problems in two or more of the five areas used to measure general family security. Problems in the economic area were found to have less significance than those of a more psychological nature.
Principal investigator: Grace D. Reiss, M.A., Associate Professor, Graduate School of Social Work, University of Washington, Seattle 5, Wash.
Cooperating group: Tacoma Public Schools.

16-0-18 A GROUP COUNSELING PROGRAM FOR ACTING-OUT PREADOLESCENTS

Purpose: To evaluate the efficacy of group counseling for a group of acting-out preadolescents in junior high school setting.
Subjects: 15 junior high school students--10 boys and 5 girls.
Methods: Acting-out youngsters were identified by teachers and then screened for placement in a special guidance program (group counseling) by a committee of counselors and the school psychologist. Daily counseling sessions were held with an open group. Evaluation of progress was assessed by pre- and post-administration of the semantic differential. Teacher rating scales were also used in evaluation. Statistical techniques included the D statistic and Chi-square.
Findings: Results point overwhelmingly to the success of the approach. Highly significant findings were indicated in four semantic differential concepts. Teacher ratings were significant in 7 of 12 areas.
Publication plans: Will be submitted to California Journal of Education Research.
Duration: September 1958-June 1962.
Principal investigator: Allen P. Webb, Ph.D., Psychologist, Pasadena City Schools, 351 S. Hudson, Pasadena, Calif.

16-0-19 RELATIONSHIP BETWEEN CHRONIC TRUANCY AND EARLY SCHOOL PHOBIA

Purpose: To determine if there is a relationship between chronic truancy and a history of an earlier school phobia; to compare the characteristics of those chronic truants who have a history of an earlier school phobia with those who do not; to evaluate any treatment given to the children with school phobia.
Subjects: 28 children who were seen by the Institute for Juvenile Research in Chicago, Illinois, and who were checked as being "chronic truants".
Methods: Thorough review of case histories of "chronic truants," attempting to determine if any had been school phobic children prior to becoming chronic truants. Data recorded verbatim and systematically on schedules.

Findings: Of the 28 chronic truants, 14 were found to have had a history of an earlier school phobia. Only 4 of the 14 had been treated. In nearly all respects, there were no differences between the chronic truants who had a history of an earlier school phobia and those who did not.
Publication plans: Plan to submit articles to Mental Hygiene, Child Welfare, and Social Casework.
Duration: September 1962-January 1963.
Principal investigators: Harry E. Grob, Jr., M.S.W., Assistant Superintendent, and R. Don Harvey, M.S.W., Social Worker, Chaddock Boys School, Quincy, Ill.
Cooperating group: Institute for Juvenile Research.

16-0-20 DISTRIBUTION AND CHARACTERISTICS OF SCHOOL DROPOUTS IN MANHATTAN

Purpose: To determine the incidence, distribution, and characteristics of school dropouts from the borough of Manhattan.
Subjects: A 25 percent sample, randomly selected, of all dropouts from Manhattan schools during the fiscal year 1960-61.
Methods: The characteristics of these dropouts will be obtained from school records, characteristics of residence from census tract data, characteristics of employment efforts obtained from New York State Employment Service. A sample of the panel of dropouts will be interviewed to determine long- and short-term aspirations, feelings of deprivation, value systems, adherence to delinquent subcultures and attitudes to the world of work. These interviews will be tape-recorded and will be of a semistructured, open-ended funnel type.
Publication plans: To be published in May 1963.
Duration: February 1962-February 1963.
Principal investigator: Arthur Pearl, Ph.D., Director of Research, New York State Division for Youth, 155 Washington Ave., Albany 10, N. Y. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: New York City Board of Education; New York State Employment Service.

16-0-21 AN EVALUATION OF A VOCATIONAL ADVISORY SERVICE PROGRAM FOR SCHOOL DROPOUTS

Purpose: To evaluate the effectiveness of a special Experimental Vocational Advisory Service Program for school dropouts developed by the Vocational Advisory Service in conjunction with the State Division for Youth and the State Employment Service.
Subjects: A random sample of all 16 and 17 year old school dropouts will be referred to the Vocational Advisory Service special program and designated as experimentals. The controls will be treated by the State Employment Service in their normal procedures.
Methods: Experimental and control cases will be categorized as to values, work history, personal maturity and aspiration. There will be a careful process recording of the VAS experience and a follow-up longitudinally for a period of five years to determine the relative ability of the experimental cases to obtain, sustain, and advance in jobs when compared with control cases, determining if the effects are short-lived or have long-term value. It will be a function of the research to ascertain the category of youngsters who are best serviced by this program.
Duration: March 1962-March 1967.
Principal investigator: Arthur Pearl, Ph.D., Director of Research, New York State Division for Youth, 155 Washington, Ave., Albany 10, N. Y. (Reported in Current Projects in the Prevention, Control and Treatment of Crime and Delinquency, 1962.)
Cooperating groups: New York State Employment Service; Vocational Advisory Service.

Specific skills

16-P-1 THE RELATIONSHIP BETWEEN BIRTH ORDER AND READING ABILITY IN A GROUP OF THIRD GRADE SCHOOL CHILDREN

Purpose: To investigate relationship between certain sibling group structural characteristics (birth order, size of sibling group, spacing of siblings, sex composition of sibling group) and reading ability (both disability and superior ability) controlling for I.Q., socio-economic status, and sex.
Subjects: 816 third grade boys and girls who are not twins and are from families containing no step- or half-brothers or sisters.
Methods: Multi-variate analysis of data.
Findings: I.Q., socio-economic status, sex strongly related to reading ability. Birth order, size of sibling group, maternal employment related to reading ability but not spacing or sex composition of sibling group.
Publication plans: Plan to publish as Ph.D. dissertation.
Duration: 1960-1962.
Principal investigator: Perry Levinson, (Ph.D. Candidate), Social Science Analyst, Mental Health Study Center, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Adelphi Plaza, Adelphi, Md.
Cooperating groups: Prince Georges County Board of Education; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-P-2 READING ACHIEVEMENT AND SUBSEQUENT OUTCOME: A POPULATION STUDY

Purpose: To apply epidemiological and sociological methods to the longitudinal study of various reading levels (retarded, at grade, and advanced) to determine the subsequent outcome. This is a continuation of the study "Epidemiology of Reading Disability" begun by Miller, Margolin, and Yolles (Bulletin 4, Research Relating to Children).
Subjects: All the students in a Maryland county public school system enrolled in regular sixth grade classes in 1954-55.
Methods: Longitudinal: subjects followed until they graduated form high school or left the school system. Reading levels were associated with later academic and social achievement. Epidemiological: a population was used as the comparison base to determine incidence and prevalence rates for various reading levels and conditions (such as dropouts) at various points in the school career. Sociological: the geographical area was divided into social areas (such as school districts); demographic characteristics (age, sex, socio-economic status, etc.) were related to achievement.
Publication references: American Journal of Public Health 47:1250-1256, October 1957; chapter in J. Money, Reading Disability: Progress and Research Needs in Dyslexia, Johns Hopkins Press, 1962.
Principal investigator: J. R. Newbrough, Ph.D., Scientist, Mental Health Study Center, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Adelphi Plaza, Adelphi, Md.

16-P-3 THE EFFECT OF IMPROVEMENT IN READING UPON OTHER SCHOOL SUBJECTS

Purpose: To determine the effect of improvement in reading skills upon other school subjects. It was desirable to note what specific school subjects were involved and whether statistically significant gains were made.
Subjects: 80 subjects in fifth and sixth grades--40 subjects were enrolled in remedial reading groups for an entire year; 40 subjects constituted the controls. Subjects were matched by sex, grade, and teacher to minimize bias.
Methods: The remedial reading groups received one hour per week additional training for one school year of nine months. The remedial reading teacher conducted all of the training. Results were analyzed by an analysis of covariance to determine significance.

Findings: All school subjects that depended primarily upon reading ability made some gains. At least one experimental group made significant gains in each. The remedial groups consistently outgained the control significantly in study skills evaluation. Arthmetic was the only school subject which was apparently immune to improved reading skills. Overall improvement was shown in the Battery Median gains for the remedial groups. Sixth grade made a greater number of gains than fifth grade. Girls made more significant gains than boys in a ratio of four to one.
Publication plans: To be submitted to professional psychology, education, or reading journal. If not published, no conditions will be imposed on making the data available.
Duration: September 1961-November 1962.
Principal investigator: Leon D. Radaker, Ed.D., School Psychologist and Director of Research, Butler Area Schools, Box 791, Butler, Pa.

16-P-4 VALUE OF READING INSTRUCTION TO SELECTED KINDERGARTENERS

Purpose: A formula for the prediction of reading success will be devised on the basis of a multiple regression analysis of data on the physiological, intellectual, and emotional development and the socio-economic background of third grade pupils. The formula will be used for prediction of reading success of entering kindergarteners.
Subjects: 36 kindergarteners.
Methods: Experimental group will be given reading instruction 30 minutes a day for eight months, October through June. At the end of the year, reading test scores will be compared with predicted achievement. Results of this analysis, along with data from behavior rating scales and vision tests, will be used to determine: (1) if it is possible to predict accurately which five year olds will profit from reading instruction; (2) how much progress can be made in reading in kindergarten; and (3) if there are any ill effects from reading instruction in kindergarten. In subsequent years, the reading achievement of the experimental group will be compared with that of control group who did not have the early reading instruction. The reading progress of the third grade pupils providing data for the prediction formula will also be followed; new kindergarten reading groups will be started.
Duration: 1962-1965.
Principal investigators: Florence Heisler, Ph.D., and Dr. Louis M. Heil, Director, Office of Testing and Research, Brooklyn College, City University of New York, Brooklyn 10, N. Y.
Cooperating group: Research Offices, New York State Education Department.

16-P-5 THE SHORT-TERM READING READINESS NURSERY: A SOCIAL INTERVENTION TECHNIQUE

Purpose: To determine whether reading-readiness skills can be improved by a 13-week nursery experience; to test hypothesis that inability to respond to verbal instructions is part of a general deficiency in ability to adopt a learning set for nonverbal descrimination; and to better understand relationship between child-rearing techniques and nursery school adjustment.
Subjects: Children averaging 4-4 years of age from father-absent Negro families receiving Aid to Dependent Children.
Methods: A standard enriched, somewhat controlling, nursery routine is augmented by intelligence testing, Piaget-type inquiries into the theories of causality, child-socialization interviews with the mothers, and Q-sort studies of the mothers' conceptions of their children and of themselves in the role of woman, mother, and potential wage-earner.
Publication plans: Periodic multilithed reports will be available.
Duration: June 1962-1966.
Principal investigator: Fred L. Strodtbeck, Ph.D., Associate Professor of Sociology and Psychology, University of Chicago, Chicago 37, Ill.
Cooperating group: Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-P-6 A STUDY OF UNDERPRIVILEGED PRIMARY CHILDREN

Purpose: To test the values of summer school between kindergarten and first grade as preparation for reading for children from underprivileged neighborhoods.
Subjects: 60 kindergarten children scoring stanine 3 or lower on Metropolitan Reading Readiness Test, matched for sex, M.A. (Goodenough Draw-a-Man), C.A., and school. 30 attended summer school, 30 did not.
Methods: Individual Binet tests will be administered to both experimentals and controls. Reading tests at the end of the year will serve to measure value of summer school supplementary preparation for reading.
Duration: June 1962-June 1963.
Principal investigator: Vera V. Miller, M.A., Director of Research and Testing, Community Consolidated Schools, 1314 Ridge Ave., Evanston, Ill.

16-P-7 A STUDY OF THE RELATIONSHIPS BETWEEN ANTISOCIAL BEHAVIOR AND READING DEFICIENCY IN YOUNG ADOLESCENTS

Subjects: All students in the seventh, eighth, and ninth grades (junior high school) who are retarded in reading ability and have demonstrated antisocial behavior--total of 78, plus approximately 40 others (for purposes of diffusion). Selection based on Reading and Vocabulary sections of Iowa Test of Basic Skills, California Test of Personality, Lipsitt and Castaneda Self-Concept Scale, and behavior ratings by former teachers and deans.
Methods: One-half of the group, randomly selected, was enrolled in a special developmental reading class, taught by a specialist; the other half (control group) enrolled in regular classes. At the end of the school year, pupils were again evaluated by the same tests, and gains in reading and social adjustment were statistically and descriptively analyzed and interpreted.
Publication references and plans: Published as a dissertation available in University of Southern California library; articles will be submitted to *Journal of Educational Research*, etc.
Duration: August 1960-August 1961.
Principal investigator: Edward B. Wells, D.Ed. Candidate, School of Education, University of Southern California, Los Angeles 7, Calif. (Reported in *Current Projects in the Prevention, Control and Treatment of Crime and Delinquency*, 1962.)
Cooperating groups: Los Angeles County Probation Department; Santa Monica School District; Youth Studies Center, University of Southern California; Ford Foundation.

16-P-8 HOLDOVERS IN THE ELEMENTARY SCHOOL, WITH SPECIAL REFERENCE TO READING

Purpose: To explore differences in reading progress of pupils in grades one through six after retention in grade. Subproblems: (1) analysis of factors associated with retained pupils; (2) analysis of factors of administrative provision for retained pupils; and (3) analysis of growth in reading achievement of retained pupils.
Subjects: 100 pupils in each grade, selected from all school districts. Two boys and two girls on each grade level in each district.
Methods: Interview, checklist, test administration.
Duration: November 1960-December 1962.
Principal investigator: Bureau of Educational Program Research and Statistics, New York City Board of Education, 110 Livingston St., Brooklyn 1, N. Y.
Cooperating group: Elementary School Division, New York City Board of Education.

16-P-9 THE HANDWRITING ABILITIES OF LEFT-HANDED INTERMEDIATE GRADE PUPILS

Purpose: To compare the quality of handwriting of these pupils with their right-handed classmates.

Subjects: 500 left-handed children; 500 right-handed children (selected at random).
Methods: Use the Ayres' Measuring Scale for Handwriting to determine quality. Four judges used.
Publication plans: Journal of Educational Research or Journal of Educational Psychology.
Duration: Fall 1961-fall 1962.
Principal investigator: Patrick J. Groff, Ed.D., Associate Professor of Education, San Diego State College, San Diego, Calif.
Cooperating group: San Diego State College Foundation.

16-P-10 DETERMINATION OF "STRUCTURE-OF-INTELLECT" ABILITIES INVOLVED IN NINTH GRADE ALGEBRA AND GENERAL MATHEMATICS

Purpose: Several investigators have identified factors in mathematical ability. Many of these can be defined more precisely in terms of the structure-of-intellect model. Symbolic content seems important; evaluative abilities not previously measured will be explored, with the following major objectives: (1) to identify intellectual factors necessary for successful algebraic thinking; (2) to discover whether the factor structure for algebraic ability differs from that of ninth grade general mathematics; (3) to discover whether appropriate structure-of-intellect tests will serve as predictors of success in ninth grade algebra; (4) to discover possibility of eliminating the "false positives" and "false negatives" with reference to the assignment of students to algebra versus general mathematics; (5) to explore possibility of early selection of talented students for special attention in mathematics.
Methods: A battery of factor tests will be administered to students in algebra and general mathematics courses in two sections, one to be administered early in the fall semester 1961, and the other early in the spring semester 1962. Criterion tests covering the usual content of these courses will be given at the end of fall and spring semesters. Factor analyses will be made to compare factor structure of boys with that of girls and the structure of algebra students with that of general mathematics students. Composite factor scores will be derived and used in a multiple-regression procedure to predict course grades and scores on criterion tests. Profiles of students especially able in algebra will be investigated.
Duration: August 1961-August 1963.
Principal investigators: J. P. Guilford, Ph.D., Professor of Psychology, and Philip R. Merrifield, Ph.D., Adjunct Assistant Professor of Psychology, University of Southern California, Los Angeles 7, Calif.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-P-11 SCIENCE CONCEPT DEVELOPMENT IN THE ELEMENTARY SCHOOL THROUGH INQUIRY TRAINING

Purpose: Further development of inquiry training methods and the determination of transfer effect to the inquiry process in various disciplines.
Subjects: 60 or more sixth grade pupils in an Urbana school.
Methods: Covariance analysis as statistical control in experiment involving three experimental and one control group of randomly assigned sixth graders.
Findings: None yet in present project. Findings of previous study (Bulletin 10, Research Relating to Children) indicate inquiry training makes children more analytical and productive in inquiry within area of physics.
Publication references: Final report from earlier project available in multilith.
Duration: September 1962-August 1964.
Principal investigator: J. Richard Suchman, Ph.D., Associate Professor of Education, University of Illinois, Urbana, Ill.
Cooperating groups: University Research Board; Cooperative Research Program, Office of Education, U. S. Department of Health, Education, and Welfare.

Special education

16-Q-1 SUPPLEMENTARY TRAINING METHODS TO IMPROVE WORD RECOGNITION DEVELOPMENT OF RETARDED READERS WITH NORMAL MENTALITY

Purpose: To evaluate the most effective methods to increase the visual cues enabling reading casualities to recognize and discriminate words more efficiently. It was hypothesized that training in imagery visualization or a combination of methods that include imagery visualization would produce the most significant results.
Subjects: 160 subjects in grades three, four, five, and six enrolled in public school remedial reading groups, with normal mentality and retarded in reading ability a minimum of 15 percent below grade equivalents as measured by the Stanford Achievement Tests. By random selection, 20 subjects were assigned to each of eight experimental conditions.
Methods: Training was provided in small groups for 15 minutes per week for four months in imagery visualization (IV), symbol discrimination (SD), and word discrimination (WD). Experimental groups constituted were: IV; SD; WD; IV-SD; IV-WD; SD-WD; and IV-SD-WD; and control. Results were statistically analyzed by an analysis of covariance to determine statistical significance.
Findings: Applicable only to reading casualties in third, fourth, fifth, and sixth grades: a higher percentage of boys reported no measurable visual images; through training procedures, boys make greater gains in the quality of the images; vocabulary development is the best single indicator of predictable academic achievement; the most significant results were obtained from a combination of training in imagery visualization and word discrimination.
Publication plans: To be submitted to professional psychology, education, or reading journals. If not published, no conditions will be attached to making the data available.
Duration: January 1961-October 1962.
Principal investigator: Leon D. Radaker, Ed.D., School Psychologist and Director of Research, Butler Area Schools, Box 791, Butler, Pa.

16-Q-2 AN EDUCATIONAL PROGRAM FOR CULTURALLY DEPRIVED KINDERGARTEN CHILDREN

Purpose: To introduce into kindergarten experiences a program specifically designed to meet the needs of culturally deprived children.
Subjects: Kindergarten children from Racine, Wisconsin, school system.
Methods: Experimental group: pre-tests, curriculum treatment, post-tests. Control group: pre-tests, no treatment, post-tests. Follow-up through first grade.
Publication plans: Appropriate journal.
Duration: September 1962-June 1964.
Principal investigators: Richard Larson, M.A., Principal, Stephen Bull School, Racine, Wis. and James L. Olson, Ed.D., Assistant Professor of Exceptional Education, University of Wisconsin, Milwaukee, Wis.
Cooperating groups: Racine School System; Johnson Foundation; Western Foundation.

16-Q-3 AN INDEPENDENT HONORS PROGRAM FOR THE ACADEMICALLY TALENTED

Purpose: Hypotheses to be tested concern the usefulness of personality and special intellectual measures in the prediction of success in an independent honors program and the positive influence of independent honors work on special intellectual characteristics.
Subjects: Pilot year, 10 gifted high school students--8 seniors and 2 juniors; second year, 40 juniors.
Methods: During pilot year, students worked independently on projects of their own choosing one school period per day; topics ranged from the personality of the American demagogue to paper chromatography. This year, the experimental group will spend the equivalent of one day per week on their independent projects. Evaluative instruments will include Getzel and Jackson's Tests of Creativity and Intelligence, Cattell's Objective-Analytic Personality Test Battery, the Brown-Holtman Survey of Study Habits and Attitudes, the Watson-Glaser Critical Thinking Appraisal, the ETS Guidance Testing Battery, the Minnesota Counseling Inventory, and the ETS Biographical Inventory.

Duration: 1962-1963.
Principal investigators: Charles Sansone, Chairman, Social Studies Department, Fox Lane School, S. Bedford Rd., Bedford, N. Y., and Francis G. Cornell, Ph.D., President, Educational Research Services, Inc., 124 East 40th St., New York 16, N. Y.
Cooperating group: Research Offices, New York State Education Department.

16-Q-4 INDEPENDENT STUDY SEMINAR EVALUATION AT ELEMENTARY LEVEL

Purpose: An attempt will be made to determine whether, or to what extent, the special conditions of the program and the differences, if any, between talented and creative children influence the process of problem solving.
Subjects: 50 fifth and sixth grade children identified in the first year of this experimental program as talented and/or creative.
Methods: Children will participate in a special "outside-school-hours" program of independent study and seminar evaluation, working with the guidance of graduate interns from Teachers College, Columbia University. Evaluation will utilize an adaptation of Rimoldi's technique for the study of performance in a problem-solving situation.
Duration: 1962-1963.
Principal investigators: Dr. Daniel F. Stevens, Principal, Oyster Bay Elementary School, East Main St., Oyster Bay, N. Y., and Miriam Goldberg, Ph.D., Assistant Professor, Teachers College, Columbia University, New York, N. Y.
Cooperating group: Research Offices, New York State Education Department.

16-Q-5 MEETING NEEDS OF GIFTED: A NONSTRUCTURED SUMMER PROGRAM

Subjects: Experimental group of 50 gifted children (I.Q. 130 or above) entering fifth and sixth grade; control group of 50 children matched on age, sex, grade, I.Q., achievement, and socio-economic status.
Methods: Subjects will take part in a summer program designed to increase problem-solving ability and to meet operant needs. Each child will have maximum freedom to explore areas of interest in science and the language arts through independent study and individual research projects. Comparison of experimental and control groups. Changes in problem-solving ability will be measured by score differences on STEP tests in science and language arts given before and after the summer program. Shifts in the levels of operant needs (e.g., affiliation, dominance, stimulation, deference) will be measured by pre- and post-selection factors used (age, sex, intelligence, reading comprehension, arithmetic reasoning) and success in the summer program as measured by the STEP tests will also be studied. The statistical analysis will include t tests and product moment and point biserial correlation coefficients.
Principal investigator: Carl M. Winston, Ph.D., Research Chairman, Plainview-Old Bethpage Public Schools, Plainview, N. Y.
Cooperating group: Research Offices, New York State Education Department.

16-Q-6 PROGRAMMED INSTRUCTION AS A DEVICE FOR THE CORRECTION OF WRITTEN LANGUAGE IN ADOLESCENT DEAF CHILDREN

Purpose: (1) To analyze the written language of deaf adolescents and its effect upon communication; (2) to determine effect of conditioning in correction of these errors; and (3) to determine relative effect of induction versus deduction on the learning process.
Subjects: 300 deaf adolescents attending eight residential and day schools for the deaf.
Methods: Ten linear programs have been prepared to cover 10 most frequent grammatical errors. These each have two forms--inductive and deductive. One-half of experimental group will be presented each form. Programs will be presented when an error covered by a given program is observed. Experimental group I will be given each program once, over a five-week period. Experimental group II will be given programs repeatedly, over a six-month period, when the error is noted to take place. A control group will indicate normal gains over the six-month period.

Findings: Results of the initial analysis of errors indicates that 10 discrete grammatical errors account for 82 percent of total errors. Attempt to modify errors through programmed instruction is currently in the experimental phase.
Publication plans: American Annals of the Deaf; Exceptional Children.
Duration: July 1962-July 1963.
Principal investigators: Jack W. Birch, Ph.D., Chairman, Department of Special Education and Rehabilitation, and E. R. Stuckless, M.S., Instructor, University of Pittsburgh, Pittsburgh 13, Pa.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-Q-7 EVALUATION OF HIGH SCHOOL MATHEMATICS PROGRAMMED TEXTS AS USED WITH DEAF STUDENTS

Purpose: To compare the relative effectiveness with deaf students of programmed texts with the "conventional" lecture in high school mathematics. To determine the relative achievement gained from the use of programmed texts of high school mathematics and to relate that achievement with English language ability and emotional dependence.
Methods: Based upon initial measurements of achievement in mathematics, students will be grouped on three levels: low, middle, and high. Each level will further be split into two classes matched on both initial achievement and English reading comprehension. A different instructor will be assigned to teach each level. He will use the usual lecture method with one class and the programmed texts with the matched class. Two-way analyses of variance will be used to test significance of differences between experimental and control groups. Correlational analyses will also be carried out with such predictor variables as reading comprehension, emotional dependence, and student opinions about the use of the programmed text. Criterion variables will be estimates of "true" achievement and time required to finish the program. Multiple regression estimates will be obtained where possible.
Duration: April 1962-March 1964.
Principal investigator: Harry Bornstein, Ph.D., Research Professor of Psychology, Gallaudet College, 7th and Florida Ave., N.E., Washington 2, D. C.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-Q-8 A PROGRAMMED READING METHOD FOR MENTALLY HANDICAPPED CHILDREN

Purpose: To test a programmatic method of teaching reading skills to mentally retarded children.
Subjects: Randomized samples of retarded children in public school classes.
Methods: (1) Development of programmed materials to provide a reading program to children using Progressive Choice Reading Method; and a programmed presentation of the Progressive Choice Method for teachers; (2) development of special reading test suited for evaluating zero skill and low skill readers (Progressive Choice Marginal Diagnostic Reading Test); and (3) randomized samples of subjects in experimental and control groups, pre- and post-tested at beginning and end of year.
Publication references and plans: American Journal of Mental Deficiency 67:274-280, September 1962. Articles in journals and Institute of Educational Research monograph.
Duration: May 1962-April 1965.
Principal investigator: Myron Woolman, Ph.D., Director, Institute of Educational Research, Inc., 2226 Wisconsin Ave., N.W., Washington 7, D. C.
Cooperating groups: Baltimore City School System; Fairfax County Schools; Jewish Foundation for Retarded Children, Inc.; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-Q-9 EVALUATION OF THE PROGRAM FOR THE BRAIN-INJURED CHILD

Purpose: To evaluate various aspects of the program for the brain-injured child and, insofar as possible, make some assessment of the children's growth.

BEST COPY AVAILABLE

Subjects: Children with mild neurological handicaps, and with learning and adjustment problems, enrolled in special classes for brain-injured children.
Methods: Observation of the classes (behavior of children, class programs, etc.); administration of achievement tests in reading and mathematical concepts to assess pupil behavior in a test situation (frustration level, attention span, etc.) and growth in reading and mathematical concepts. Structured interviews with teachers, supervisors and other personnel. Follow-up of children discharged from the program.
Publication references: Interim report in 1959.
Duration: 1958-fall 1962.
Principal investigator: Sue Moskowitz, M.A., Bureau of Educational Research, New York City Board of Education, 110 Livingston St., Brooklyn 1, N. Y.
Cooperating group: Bureau for the Physically Handicapped, Division of Child Welfare, New York City Board of Education.

16-Q-10 PILOT STUDY TO DETERMINE THE RESULTS OF APPLYING THE MONTESSORI METHOD OF TEACHING TO HANDICAPPED CHILDREN

Purpose: To compare the Montessori method with the orthodox method.
Subjects: Children with brain damage, aged three to seven years.
Methods: Application of Montessori method.
Publication plans: No publication as yet; probably preliminary report will be available in July 1963.
Duration: September 1962-June 1965.
Principal investigators: William P. Argy, M.D., Medical Director, Peggy S. Misback, M.A., Coordinator, Sibyl K. Devereux, A.B., Teacher, and Constance Corbett, A.B., Teacher, District of Columbia Society for Crippled Children, 2800 13th St., N.W., Washington 9, D. C.

16-Q-11 A WORK SKILLS EDUCATION AND PLACEMENT PROGRAM FOR HANDICAPPED YOUTHS, TOGETHER WITH AN EVALUATION OF FACTORS RELATING TO VOCATIONAL SUCCESS

Purpose: Through cooperative efforts of school personnel, counselors, and rehabilitation placement officers, to provide an intensive work skills study and placement program for handicapped youths. Attempts will be made: (1) to compare level of post-school vocational success of trainees in this program with level achieved by a like group participating in the standard program now being offered; (2) to evaluate presently available educational and case history records to determine whether data contained therein are predictive of vocational success or failure; (3) to compare similar, as well as additional, data secured during the course of the project to determine whether they have predictive value for vocational success; (4) to develop guides for curriculum planning for handicapped school age youths; (5) to investigate the significance of the differential in vocational success between applicants of apparently equal competence and training, and to measure the differential in educational and vocational rehabilitation services required to bring about, if it is possible, an equalizing of vocational success; (6) to develop a handbook for training and placement workers; and (7) to determine the efficiency of a placement specialist in securing employment for those who are extensively handicapped.
Publication plans: Annual reports, final report, and probably some articles for educational journals.
Duration: 1962-1967.
Principal investigator: Paul R. Hunt, M.Ed., Department of Special Education, Detroit Public Schools, 453 Stimson, Detroit 1, Mich. (Reported by Paul H. Voelker, Ph.D., Divisional Director, Department of Special Education.)
Cooperating group: Office of Vocational Rehabilitation, U. S. Department of Health, Education, and Welfare.

16-Q-12 EFFECTIVENESS OF EARLY APPLICATION OF VOCATIONAL REHABILITATION SERVICES IN MEETING THE NEEDS OF HANDICAPPED STUDENTS IN A LARGE URBAN SCHOOL SYSTEM

Purpose: To demonstrate a method of serving the vocational rehabilitation needs of New York City students who present a problem of suitable vocational adjustment with currently available services.

Subjects: Students, age 14 or over, enrolled in special classes for the severely handicapped including those with mental retardation, social maladjustment, cerebral palsy, and miscellaneous problems.

Methods: Each student will receive complete evaluations to determine individual needs. For two years, demonstration students will receive an integrated program of services provided by the New York City Schools, voluntary rehabilitation centers and workshops and the New York State Division of Vocational Rehabilitation. Effectiveness of project services will be evaluated by comparing progress of demonstration and comparison students at several stages in regard to educational, vocational, personal and social development.

Duration: June 1962-June 1967.

Principal investigator: Morris Klapper, M.S., Division of Vocational Rehabilitation, New York State Education Department, Albany 1, N. Y. (Reported by Adrian Levy, Assistant Commissioner for Vocational Rehabilitation, New York State Education Department.)

Cooperating groups: New York City Board of Education; Federation Employment and Guidance Service; Federation of the Handicapped; Institute for the Crippled and Disabled; Division of Vocational Rehabilitation, New York State Education Department; Association for the Help of Retarded Children, Inc.; Office of Vocational Rehabilitation, U. S. Department of Health, Education, and Welfare.

16-Q-13 A GUIDED WORK EXPERIENCE PROGRAM FOR HANDICAPPED TEENAGERS

Purpose: (1) To demonstrate that a vocational program with educable mentally handicapped adolescents based on a rehabilitation workshop is more effective if begun in early adolescence than if begun in late adolescence; (2) to study the process of vocational development for educable mentally handicapped adolescents.

Subjects: 40 14 year old children attending special classes for educable mentally handicapped children in the Chicago area.

Methods: Two matched groups have been selected. Experimental group is participating in a rehabilitation workshop program and will receive a variety of services, graded in difficulty, for four to five years, or until they have had an opportunity to attempt work in competitive employment. Control group will receive rehabilitation service when they become 17. Annual measures are taken on both groups, beginning at age 14, to compare quality and rates of vocational development.

Publication plans: Articles for publication will be prepared.

Duration: July 1961-June 1964.

Principal investigator: William Gellman, Ph.D., Executive Director, Jewish Vocational Service, 1 S. Franklin St., Chicago 6, Ill. (Reported by Asher Soloff, Research Coordinator, Jewish Vocational Service.)

Cooperating groups: Chicago Heart Association; Chicago Board of Education; Niles Township Board of Education; United Cerebral Palsy Association; Wieboldt Foundation.

EXCEPTIONAL CHILDREN

Gifted

16-R-1 AN ABBREVIATED WISC FOR USE WITH GIFTED ELEMENTARY SCHOOL CHILDREN

Purpose: To test the feasibility of devising an abbreviated scale of the Wechsler Intelligence Scale for Children, which would be a valid measure of intelligence for gifted school children and at the same time would economize test administration time.
Subjects: 551 children identified as gifted with a full-scale score of 125 or above on the WISC, enrolled in a public elementary school, mean C.A. 10-2 years, mean I.Q. 133.
Methods: Test protocols were randomly divided--400 to use as a standardization group and 151 to use as a validation group. Design was to select the combination of subtests which correlated highest with the full scale I.Q. and at the same time met the economy of time criterion. The best subtest combination for prediction was selected by the Wherry-Doolittle test selection method. After the subtests were identified, they were summed for each individual and total was correlated with the criterion and a regression equation computed.
Findings: Selected subtests were similarities, block design, picture arrangement, information and picture completion. The multiple correlation for this subset was .75 with a standard error of 3.96 I.Q. points. The correlation between the actual and the predicted I.Q. for the validation group was .84.
Publication plans: Submitted for publication; duplicated copies available from Sonoma County Schools.
Duration: August 1960-October 1961.
Principal investigators: Jack M. Thompson, M.A., Director of Guidance, and Carmen J. Finley, Ph.D., Director of Research, Sonoma County Schools, 2555 Mendocino Ave., Santa Rosa, Calif.
Cooperating group: Rosenberg Foundation.

16-R-2 HIGH POTENTIAL SCALE OF MINNESOTA MULTIPHASIC PERSONALITY INVENTORY

Purpose: Development of a scale to predict high potential in science in adolescents who have not as yet demonstrated high achievement.
Subjects: Normative group: 150 mathematically gifted adolescents who have demonstrated high achievement-high intelligence; and 150 adolescents with high intelligence-low achievement.
Methods: Development and cross-validation of a scale of MMPI. Six-week summer math camp experience for 30 high potential-low achievement children.
Publication plans: Journal of Clinical Psychology.
Duration: May 1962-May 1963.
Principal investigator: Wallace A. Kennedy, Ph.D., Staff Chairman, Human Development Clinic, Florida State University, Tallahassee, Fla.
Cooperating group: National Science Foundation.

16-R-3 THE LISTENING ABILITIES OF GIFTED CHILDREN

Purpose: To compare the listening abilities of gifted children in the intermediate grades with their other language skills.
Subjects: 100 intermediate grade gifted children.
Methods: Compare scores on STEP Listening Test with language ability scores obtained on Stanford Achievement Tests.
Publication plans: Journal of Educational Research or Journal of Educational Psychology.
Duration: Fall 1962-fall 1963.
Principal investigator: Patrick J. Groff, Ed.D., Associate Professor of Education, San Diego State College, San Diego, Calif.

Retarded

16-S-1 THIN-LAYER CHROMATOGRAPHY OF SPINAL FLUID LIPIDS

Methods: The lipids in cerebrospinal fluid will be extracted and separated by means of thin-layer chromatography. The patterns obtained from mentally retarded children and from those with various neurological disorders will be compared to patterns obtained from normal children and adults. This rapid ultramicro method of searching for lipid abnormalities in CSF will be evaluated as a diagnostic test.
Duration: 1962-1964.
Principal investigator: Alex Kaplan, Ph.D., Associate Professor of Biochemistry and Director, Clinical Chemistry Laboratory, University Hospital, University of Washington, Seattle 5, Wash.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-2 EVALUATION OF BIRTH DEFORMITIES IN THE PROVINCE OF ALBERTA

Purpose: To evaluate birth deformities in the Province of Alberta with relation to drugs and radioactive isotopes and also spermatogenesis in Mongols with relation to fertility studies.
Duration: 1959-1965.
Principal investigator: L. J. le Vann, L.R.C.P., L.R.C.S., Medical Superintendent and Lecturer in Psychiatry, University of Alberta, Edmonton, Alta.

16-S-3 THE GENETICS OF MENTAL RETARDATION--STUDIES OF CHROMOSOMAL ABNORMALITIES

Purpose: By doing chromosomal studies and correlating the abnormalities found with patients' mental and physical defects, it is hoped that "mapping" of human chromosomes, i.e., determining which chromosomes are responsible for specific aspects of the human make-up, will in time become possible. Chromosomal studies have been done with the mentally retarded and abnormalities found in patients with Mongolism, multiple congenital abnormalities, and gonadal anomalies. Preliminary studies have been done on some of patients in these and other categories, and it is planned to continue work on a larger scale.
Subjects: Population of over 2,300 mentally retarded patients of both sexes, all age groups, and many different diagnostic categories, at Wrentham State School; patients at the other three State Schools in Massachusetts in order to increase number of cases and to validate the consistency of findings.
Methods: It is planned to do chromosomal analyses of groups of patients belonging to specific diagnostic categories and, when abnormalities are found, to do further ancillary studies. These will include chromosomal studies on the patients' families and on other patients in the same diagnostic categories to determine the genetics of the abnormality and the uniformity of its existence in similar patients. Urinary amino acid studies and other biochemical determinations will be done as indicated.
Duration: 1961-1963.
Principal investigators: Charles V. Pryles, M.D., Director of Research, and Mary Ann O'Sullivan, M.D., Research Associate, Department of Research, Wrentham State School, Wrentham, Mass., and Leonard Atkins, M.D., Department of Pathology, Massachusetts General Hospital, Boston 14, Mass.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-4 BIOCHEMICAL DEFECTS IN MENTALLY RETARDED CHILDREN

Purpose: To characterize biochemical defects in retarded children and to determine effect on mental ability; to determine inheritance of biochemical defects.

Subjects: Children from Gracewood State School and Hospital and from the teaching hospitals and clinics of the Medical College of Georgia.

Methods: Metabolic studies determined by nature of defect under investigation.

Duration: January 1962-indefinite.

Principal investigators: W. Knowlton Hall, Ph.D., Professor and Chairman of Biochemistry, Margaret B. Coryell, Ph.D., Instructor in Biochemistry, Boyd D. Sisson, Ph.D., Associate Professor of Psychiatry, Medical College of Georgia, Augusta; Theo G. Thevaos, M.D., Assistant Clinical Professor of Pediatrics and Chief of Medical Education and Research, Gracewood State School and Hospital, Gracewood, Ga.

Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-5 PHENYLKETONURIA DETECTION

Purpose: To apply the Guthrie method of inhibition assay to: (1) determine feasibility of screening bloods of pregnant women to detect phenylketonuria; (2) establish normal levels of serum phenylalanine in large population groups; and (3) study the possibility of detecting the carrier state. To study family characteristics of known phenylketonuric families.

Subjects: Pregnant women (bloods already submitted for syphilis serology--19,000 per year); newborns in hospital nurseries; suspect groups of children with brain damage.

Methods: Guthrie method of phenylalanine determination with statistical analysis of results; epidemiological study of phenylketonuria.

Publication plans: Medical and public health journals.

Duration: August 1962-1965.

Principal investigator: Carl C. Ashley, M.D., Director, Maternal and Child Health Section, Oregon State Board of Health, P. O. Box 231, Portland 7, Oreg.

Cooperating groups: Oregon Fairview Home; Oregon State Hospital; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-S-6 MENTAL RETARDATION ASSOCIATED WITH DISORDERS OF LIPID METABOLISM

Purpose: To find evidence for inborn errors of lipid metabolism in mentally retarded children, especially in the familial types of retardation. The lecithins, cephalins, plasmalogens, sphingomyelins, and cerebrosides will be of primary interest, because of their importance to the structure and function of the central nervous system.

Subjects: Elwyn School population of 1,100 mental retardates; retardates referred from the Children's Hospital of Philadelphia; and outpatients examined at Elwyn Research and Evaluation Center.

Methods: Serum levels of phospholipids and cerebrosides will be measured by quantitative paper chromatography on silicic acid-impregnated paper.

Findings: No major abnormalities have been found to date.

Publication plans: Results will be published following further collection of data.

Duration: January 1962-December 1964.

Principal investigators: Richard L. Stambaugh, Ph.D., Director of Biochemistry, and Douglas T. Davidson, M.D., Director of Research, Elwyn Research and Evaluation Center, Elwyn School, Elwyn, Pa.

Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-7 METABOLIC STUDIES OF CHILDREN WITH MONGOLISM

Purpose: To learn the basis of the observed abnormalities in tryptophan metabolism.
Subjects: Mongoloid children.
Methods: Study of enzyme kynureninase in samples of liver from normal and Mongoloid individuals. Study of xanthurenic, kynurenic and 3 OH anthranilic acid excretion in Mongoloid and non-Mongoloid controls. Twenty-four hour urine collections done before and after a tryptophan load and reported at intervals during Deoxypyridoxine administration. These experiments are designed to show whether the decrease in xanthurenic acid excretion observed in Mongols is due to increased conversion of 3 OH kynurenine to 2 OH anthranilic acid.
Duration: 1962-1965.
Principal investigator: Ernest E. McCoy, M.D., Assistant Professor, Department of Pediatrics, University of Missouri School of Medicine, Columbia, Mo.
Cooperating group: National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-8 METABOLIC DISORDERS ASSOCIATED WITH MENTAL RETARDATION

Purpose: To study interrelationships between mental deficiency and metabolic disorders; to attempt to define the site and nature of the biochemical lesion in such disorders by investigation of affected children and their normal relatives; to determine if the manifestation of the metabolic defect can be altered by dietary or metabolic changes.
Subjects: Young infants born in Cincinnati General Hospital; mentally retarded children admitted to Children's Hospital; mentally retarded children seen at Hamilton County Diagnostic Clinic. Long-term studies on infants normal at birth to be used as controls for mentally retarded children.
Methods: Evaluation by laboratory tests including chromatography, enzymatic tests, routine procedures, physical examination, developmental studies.
Publication references: Findings reported in series of papers in pediatric journals.
Duration: April 1956-1966.
Principal investigator: Helen K. Berry, M.A., Assistant Professor of Research Pediatrics, University of Cincinnati College of Medicine, Cincinnati 29, Ohio.

16-S-9 STUDY ON CONGENITAL TOXOPLASMOSIS

Purpose: To investigate the possible incidence of congenital toxoplasmosis in a group of patients at the Hospital for the Mentally Retarded.
Subjects: A group aged 2 to 21 years.
Methods: Abstracting of pertinent data from 240 case records; carrying out laboratory tests on serums and skin tests.
Duration: September 1962-June 1963.
Principal investigator: Michael Elyan, M.D., D.C.H., Director of Clinical Research on the Mentally Handicapped, Hospital for The Mentally Retarded, Stockley, Georgetown, Del.
Cooperating group: Communicable Disease Center, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-10 STEREOTYPED MOVEMENTS OF MENTAL DEFECTIVES

Purpose: A series of four studies to describe stereotyped movements of mentally defective children and adults; to analyze their relationships to other individual characteristics, and to examine experimental variables to which they are sensitive.
Subjects: Severely defective institutionalized children and adults.

BEST COPY AVAILABLE

Methods: Observational procedures (time-ruled checklist). Measurement of stereotyped movements, manipulations of the environment and manipulations of self when subject is given objects to play with in different situations.
Findings: Positive correlations of stereotyped movements with self-manipulations and age. Negative correlation with manipulation of environment. In experiments, providing subjects with objects to play with reduced stereotyped movements. Those with high level movements played less. Three situations varying in novelty did not affect level in subjects who characteristically had high level. In the latter subjects, having a person present decreased the movements slightly, but playing with him had no further effect.
Publication plans: American Journal of Mental Deficiency.
Duration: April 1961-indefinite.
Principal investigator: Gershon Berkson, Ph.D., Research Associate, Yerkes Laboratories of Primate Biology, Orange Park, Fla.
Cooperating groups: Sunland Training Center; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-11 COMMUNICATION BETWEEN MENTALLY RETARDED CHILDREN

Purpose: To describe the acquisition and transfer of communication behavior in mentally retarded children.
Subjects: Experiment I (Hollis): male and female subjects, mean age 11 years, with I.Q.'s between 15 and 40. Experiment II (Spradlin): male and female subjects, mean age 13 years, with I.Q.'s between 25 and 75.
Methods: The behaviors of paired subjects will be investigated under the following conditions: food-sharing, cooperation, and communication. The apparatus consists of a modified Wisconsin General Test Apparatus. Four pairs of carts were mounted and connected by expandable racks so that movement of one cart simultaneously moved the other in the opposite direction. This situation requires that the "operator" subject receive cues from the "informant" subject concerning which is the correct cart to pull. A correct response rewards both subjects. (See Mason and Hollis, "Communication between Young Rhesus Monkeys," Animal Behavior, 1962, in press.)
Publication plans: Journal of Abnormal and Social Psychology, American Journal of Mental Deficiency, or Child Development.
Duration: June 1962-December 1963.
Principal investigators: John H. Hollis, B.A., Research Associate, and Joseph Spradlin, Ph.D., Field Director, Bureau of Child Research, University of Kansas, Lawrence, Kans., and Parsons Research Project, Parsons State Hospital and Training Center, Parsons, Kans.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-12 AN INVESTIGATION OF VOCAL ENCODING IMPAIRMENT IN EDUCABLE MENTALLY RETARDED CHILDREN: DETECTION, REMEDIATION AND RELATED VARIABLES

Purpose: To determine the educability of a psycholinquistic function (vocal encoding ability, i.e., the ability to express one's ideas in words) in educable retarded children.
Subjects: 40 educable mentally retarded subjects--20 experimental, 20 controls--C.A. 8-0 to 15-5, M.A. 4-7 to 8-10, I.Q. 50 to 80.
Methods: Treatment consisted of intensive language training in the vocal encoding area, three times per week for an hour per day in small groups of four to five subjects. Treatment ran from February to June. Measures include pre- and post-testing with the ITPA, and with a number of Templin's classical measures of language development. In addition, data will be analyzed for correlational relationships between a number of specified variables and response to treatment. A three-month retention study to determine the permanence of language improvement (in vocal encoding) conducted during fall 1962. Controls received the weekly classical language measures to control for the Hawthorne effect.
Publication plans: Dissertation Abstracts; American Journal of Mental Deficiency.
Duration: February 1962-September 1962.

Principal investigator: Kenneth R. Blessing, M.Ed., Coordinator, Services for Mentally Retarded, Bureau for Handicapped Children, Wisconsin State Department of Public Instruction, 122 W. Mifflin, Madison, Wis.

16-S-13 PERPETUAL CHILD

Purpose: To demonstrate the possibilities of verbal learning in high level Mongoloids
Subjects: A case study of a Mongoloid to age 47, with edited diary from age 11 to 46.
Methods: Complete combing and editing of the diaries; selection of the pertinent and parallel. Testing of verbal and readability levels (present g.p. 7.8). Clinical and interview data rounding out the case history.
Findings: With careful instruction, in this case individual using the kinesthetic method, a high level of reading and writing performance is possible, together with the development of intellectual interests. However, the dependency and need for supervision continue.
Duration: February 1961-December 1962.
Principal investigator: May V. Seagoe, Ph.D., Professor and Assistant Dean, School of Education, University of California at Los Angeles, Los Angeles 24, Calif.
Cooperating group: University of California at Los Angeles.

16-S-14 BEHAVIORAL CONDITIONING ANALYSIS OF DISCRIMINATION DEFICITS IN RETARDED CHILDREN

Purpose: To explore the ability of behavior conditioning techniques for analyzing specific individual deficits in basic discrimination processes among retarded children.
Subjects: 25 students (residents) of Walter E. Fernald State School, ages 7 to 21 with mixed diagnoses, and 4 normals, ages 6 to 15.
Methods: Intensive individual experimental analysis using full environmental control, direct, simultaneous, and continuous measurement and automatic programming of stimulus presentations and response-contingent reinforcements.
Findings: The method is extremely sensitive to a broad range of reliably different individual patterns in "adjustive" behavior even among children preselected as "homogeneous" with respect to I.Q., age, sex, and socio-economic background. Specific deficits which are differentially amenable to modification by environmental consequences have been located. Current analysis is focusing on the prosthetic (reversible) versus therapeutic (nonreversible) effects of such modification.
Publication references and plans: American Journal of Mental Deficiency 67: 424-436, 1962; four other publications in preparation.
Duration: February 1961-1966.
Principal investigator: Beatrice H. Barrett, Ph.D., Director of Psychological Research, Walter E. Fernald State School, Massachusetts State Department of Mental Health, Waverley 78, Mass.

16-S-15 PERCEPTUAL EFFICIENCY AND CONCEPTUAL ABILITY OF MENTAL RETARDATES

Purpose: To evaluate the usefulness of several psychodiagnostic tests in differentiating between brain-damaged and nonbrain-damaged retardates (trainable and educable).
Subjects: 100 children in special education classes in elementary and junior high school grades.
Methods: Individual testing with Frostig test, Rutgers Figure Test, WISC, and Peabody Picture Vocabulary Test.
Publication plans: Probably a monograph.
Duration: September 1962-June 1963.
Principal investigators: Robert M. Allen, Ph.D., Professor of Psychology, R. Wayne Jones, M.S., Graduate Research Fellow, and Douglas Haupt, M.S., Graduate Student, University of Miami, Coral Gables 46, Fla.

16-S-16 CONCEPTUAL PERFORMANCE IN MENTALLY RETARDED CHILDREN

Purpose: To explore verbal and nonverbal cognitive processes underlying conceptual behavior by investigating: (a) language-relevant versus nonlanguage-relevant concepts (opposite versus sameness and symmetry); (b) verbal versus nonverbal stimuli (words versus pictures); and (c) verbal versus nonverbal response (classification by sorting out exemplars versus by verbalizing concept).
Subjects: Educable mentally retarded children (I.Q. 50 to 70) from public and parochial special education classes at M.A. levels 6 through 9.
Methods: Subjects were individually administered three tasks which varied in degree to which language experience might facilitate discovery of the conceptual principle accounting for the correct choice on a series of trials. The concepts of sameness and symmetry were exemplified by drawn geometrical figures and of opposition by selecting large versus small on a graduated series of wooden discs; transfer of the latter concept was tested by presenting materials varying in length, volume, number, brightness, position, and texture. Second task consisted of presenting 18 sets of seven items in parallel forms for words versus pictures with instructions to select three that went together; subsequently subjects were shown the correct triads and asked to verbalize the basis of the grouping. Performance was compared with that of children of normal intelligence and of deaf children of normal intelligence (latter group was studied earlier by Furth, see Bulletin 13, Research Relating to Children).
Findings: Retarded children performed as well as controls in solving problems where perceptual rather than verbal modes of solution were more suitable, but performed less well in discovering and in subsequently applying a language-relevant concept. Results of second study showed that elimination of verbal elements facilitated classificatory behavior especially for retarded subjects; verbal input was especially difficult for the younger age groups.
Publication plans: First study presented at American Association on Mental Deficiency meeting, 1962; submitted to American Journal of Mental Deficiency. Second study read at American Psychological Association meeting, 1962; submitted to Journal of Abnormal and Social Psychology.
Duration: January 1962-December 1962.
Principal investigators: Norman A. Milgram, Ph.D., and Hans G. Furth, Ph.D., Assistant Professors, Department of Psychology and Psychiatry, Catholic University of America, Washington 17, D. C.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-17 THINKING PROCESSES IN MENTALLY RETARDED CHILDREN

Purpose: To explore further the nature of thought structure and process in mentally retarded children; to examine the effects of emotional disturbance and brain injury on thought processes.
Subjects: "Educable" mentally retarded children at Wayne County Training School, C.A. 7 to 18, I.Q. 50 to 100.
Methods: Use of various tests on selected groups. If pilot studies show distinct thought patterns in different groups, next stage would be to use techniques to overcome any impairment, e.g., reading and arithmetic taught differently to subjects with concrete rather than with abstract thought abilities.
Findings: So far: emotional disturbance tends to be related to lower abstract thinking level.
Publication plans: Journal of General Psychology, in press.
Duration: December 1961-June 1963.
Principal investigator: Roger Reger, M.A., Psychologist I, Wayne County Training School, Northville, Mich.

16-S-18 DEVELOPMENT OF A SCALE OF "REAL-LIFE" OR SOCIAL INTELLIGENCE

Purpose: Development of a scale as an aid in the assessment of mentally retarded children as needing special education or training.
Subjects: Children currently referred for examination as mentally retarded.

Methods: Circularization of second edition of experimental schedule to assessing authorities, with a view to the establishment of a normative profile.
Duration: October 1960-June 1964.
Principal investigators: Denis H. Stott, Ph.D., Lecturer in Psychology, University of Glasgow, Glasgow W. 2., and L. H. Duncan, M.A., Principal Psychologist, Ayrshire, Scotland.
Cooperating groups: Medical Officers of Health; County Psychological Services.

16-S-19 EFFECTS OF TEST ANXIETY ON THE INTELLIGENCE TEST PERFORMANCE OF MENTALLY RETARDED SHCOOL CHILDREN

Subjects: 80 children (C.A. 7-7 to 15-10) attending Pacific State Hospital School. All subjects were resident patients at the hospital.
Methods: A modification of Sarason's Test Anxiety Scale for Children (TASC) was administered to each subject, after which he was given the Stanford-Binet under either "tough" or "tender" conditions. Half the subjects were also given the WISC.
Findings: Performance was not affected by test conditions. High- and low-anxious subjects did not differ in Stanford-Binet I.Q. or WISC full scale I.Q., but high-anxious subjects had significantly lower WISC performance I.Q.'s than low-anxious subjects.
Publication plans: Possibly in American Journal of Mental Deficiency.
Duration: September 1961-December 1962.
Principal investigator: Arthur B. Silverstein, Ph.D., Research Psychologist, Pacific State Hospital, P. O. Box 100, Pomona, Calif.
Cooperating group: California State Department of Mental Hygiene.

16-S-20 SOME ASPECTS OF AN ORAL-VISUAL PRESENTATION OF AN ACHIEVEMENT TEST TO EDUCABLE MENTALLY RETARDED PUPILS

Purpose: To determine whether an oral-visual administration of a standardized achievement test would give significantly higher achievement scores for educable mentally retarded pupils than would the usual written test.
Subjects: 241 educable mentally retarded pupils in elementary and secondary classes in Union and Clinton counties, Pennsylvania.
Methods: Half of the pupils were given an oral-visual adaptation of the Word Meaning subtest and the Arithmetic Reasoning subtest of the Stanford Achievement Test, Form J, and a week later were given the usual written form of the same subtests, Form K. Remaining pupils were given an oral-visual adaptation of the Word Meaning subtest and the Arithmetic Reasoning subtest of the Stanford Achievement Test, Form K, and a week later were given the usual written form of the same subtests, Form J.
Findings: A t ratio of the difference between the oral-visual and the usual written administration of the Word Meaning subtest from the Stanford Achievement Test was significant beyond the .001 level. A t ratio of the difference between the oral-visual and the usual written administration of the Arithmetic Reasoning subtest from the Stanford Achievement Test was significant beyond the .001 level. Results of the oral-visual administration were significant for both subtests at mental age levels of 60 to 155 months.
Publication plans: Plan to submit an abstract to American Journal of Mental Deficiency.
Duration: September 1960-September 1962.
Principal investigator: John A. Long, Jr., D.Ed., Principal, Highland Elementary School, Camp Hill, Pa.

16-S-21 PARENTAL ATTITUDES AND SOCIAL GROWTH OF THE RETARDED

Purpose: On the basis of a self-concept, social-reinforcement theoretical orientation, relationships are being sought between the social development of preschool retarded children and the attitudes that each parent has toward the self, spouse, and the child. Previous research with

Silhouette Test of Interpersonal Relationships indicated that children's self-concepts were significantly related to their parents' ratings of them, as well as their popularity level with their peers. In the present context, ratings by each parent of self, spouse, and child, as well as a variety of other measures of parent attitudes, are being related to test and observational material concerning the child, with the hypothesis that social development in excess of intellectual development on the part of the retarded child is associated with parents' acceptance of self, spouse, and child, as well as the levels of communication and agreement between parents and accuracy of their appraisal of the child's abilities and limitations. Also, the extensive data obtained from each mother-father-retarded child constellation are being interrelated through intensive statistical and psychodynamically interpretive family studies with the objective of thus obtaining, through a long series of individual studies, findings which might well be cancelled out in the overall multi-method pattern analysis of group data.
Duration: January 1960-December 1963.
Principal investigators: Ralph W. Colvin, Ph.D., Director of Research and Psychological Services, Astor Home for Children, Rhinebeck, N. Y.; Anne M. Ritter, Ph.D., Director of Psychological Services, and Anne L. Preston, M.A., Research Associate, Kennedy Child Study Center, 151 E. 67th St., New York 21, N. Y.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-22 MONGOLOID CHILDREN LIVING AT HOME

Purpose: Pilot phase of a study of Mongoloid children who live at home and are seen in an outpatient child study center. To compare this population of Mongoloid children with two matched groups: non-Mongoloid children comparably retarded who are also outpatients, and Mongoloid children who live in an institution. It is hypothesized that (1) Mongoloid children when compared with non-Mongoloid equally retarded children will be found to be more accepted as handicapped and deviant; and (2) Mongoloid children reared at home will be more competent intellectually than those reared in an institution, but they will be less secure.
Duration: June 1962-May 1963.
Principal investigators: Thomas W. Richards, Ph.D., Director, Psychology and Research, and Russell Sands, M.D., Chief of Medical Services, Kennedy Child Study Center, Santa Monica, Calif.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-23 A COMPARATIVE STUDY OF A PROGRAM OF SERVICES OFFERED TO PARENTS OF MENTALLY RETARDED CHILDREN

Purpose: To evaluate parents' and patients' adjustment after admission to a hospital for the mentally retarded.
Subjects: 200 families who applied for admission to Pacific State Hospital.
Methods: Aggressive casework with parents; group meetings with parents; ward tours to acquaint parents with hospital facilities; tests of statistical significance were measured on many different items.
Publication plans: Several small papers may result.
Duration: November 1959-December 1962.
Principal investigators: Mrs. Florence G. Stellern, M.A., Senior Psychiatric Social Worker, and Sheldon J. Brown, M.A., Supervising Psychiatric Social Worker, Pacific State Hospital, P. O. Box 100, Pomona, Calif.

16-S-24 AN ANALYSIS OF THE VOCATIONAL INTERESTS OF EDUCABLE MENTALLY RETARDED BOYS FROM THREE OCCUPATIONAL CLASSES

Purpose: An exploratory investigation to provide information on: (1) vocational interest

patterns as measured by the Geist Picture Interest Inventory (GPII); (2) stated hobbies and vocational preference of these youths; and (3) influence of father's occupational class upon vocational interest patterns and preferences.
Subjects: 90 male, white, educable retardates, ages 12-0 to 20-11, enrolled in a special educational program, and having no evidence of physical handicaps or psychoses--45 whose fathers were employed at skilled or semi-skilled work, 25 whose fathers were employed at skilled clerical or middle grade service jobs, and 20 whose fathers had professional or managerial positions.
Methods: Subjects were administered the GPII individually, followed by a structured interview with each boy. T scores, item analyses, and t tests of significance were among the items used to determine the influence of father's occupation upon vocational preference and interest pattern.
Findings: (1) GPII is a usable screening method for interest of these boys; (2) stated vocational interests of the retardates showed a consistent trend toward interest in unskilled and semi-skilled work, less interest in skilled and clerical jobs, and very little in professional and managerial positions. Furthermore, interests were generally consistent with reference to occupational class of fathers; subjects from different occupational classes showed significant differences in area of interest (music, outdoors, etc.).
Duration: 1960-1961.
Principal investigator: James F. Magary (Ph.D. Candidate), Coordinator of Special Education, University of Southern California, Los Angeles 7, Calif.

16-S-25 DOUBLE-BLIND STUDY ON CEREBRAL PALSY, AND POLIO PATIENTS, AND RETARDED CHILDREN

Purpose: Use of new compound in helping these subjects.
Subjects: Voluntary patients.
Methods: Double-blind study with muscle test, movies, psychological evaluations, subjective and objective findings.
Findings: All of the 20 private patients have steadily improved after having been on the compound for three years.
Publication plans: Publication at the completion of the study.
Duration: September 1962-September 1963.
Principal investigators: Fred R. Cochrane, Jr., M.D., and Robert E. Miller, Jr., M.D., Department of Pediatrics, Charlotte Rehabilitation Hospital, 1610 Brunswick Ave., Charlotte, N. C.
Cooperating group: Voluntary contributors.

16-S-26 A DEMONSTRATION PROJECT EVALUATING THE EFFECTIVENESS AND METHODOLOGY OF GROUP THERAPY FOR ADOLESCENT RETARDATES

Purpose: To evaluate the effectiveness and therapeutic advantages in a group therapy program for retarded adolescents within a clinical diagnostic and treatment setting, and to clarify and adapt the methodology and techniques of group therapy with the retarded.
Methods: The plan of operation is to set up various combinations of groups for high, moderate, and low functioning adolescents with simultaneous group counseling of parents. Complete interdisciplinary evaluation will be made before, after, and periodically during treatment. Detailed accounts of each session will be maintained. Processing of raw data will be concurrent, so that the total progress of the groups can be analyzed for the purpose of extracting a methodology that will offer guidelines to practitioners and stimulate further interest in refining and applying other psychotherapeutic approaches to the needs of the retarded.
Duration: June 1962-May 1963.
Principal investigators: Lawrence Goodman, M.S.W., ACSW, Chief Social Psychiatric Worker, and Margaret J. Giannini, M.D., Administrative Director, Mental Retardation Clinic; Ruth Rothman, M.S.S.W., ACSW, Consultant in Group Therapy and Clinical Assistant in Pediatrics, and Stella Chess, M.D., Chief, Division of Child Psychiatry; New York Medical College, Flower and Fifth Ave. Hospitals, New York, N. Y.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-S-27 A STUDY OF ON-THE-WARD TRAINING OF TRAINABLE MENTALLY RETARDED CHILDREN IN A STATE INSTITUTION

Purpose: To investigate ward environment relative to what is currently done by the ward staff to train children in the skills and behaviors included in the San Francisco Social Competency Scale. To determine characteristic level or adequacy of training undertaken by ward personnel, the amount of time ward personnel attempt training in social competence, etc.
Subjects: Trainable mentally retarded children residing on six wards in a state institution, selected on the basis of ability to meet the criterion of "trainable" and the hospital's stated objective of training for this population. Approximately 70 nursing service personnel assigned to the wards.
Methods: An observation instrument which includes a unidimensional scheme of training levels ranging from no training to optimal training, and includes areas of training related to the San Francisco Social Competency Scale. Wards will be observed by two observers for approximately 270 hours. Data will be analyzed with respect to: amount of time that ward personnel attempt any training and training in social competence characteristic level or adequacy of training undertaken by ward personnel; relationship between amount and characteristic level of training in social competence and the social competency scores of the children being trained; relationship between amount and characteristic level of training carried out by ward personnel and their years of experience, chronological age, sex, and education; ward personnel's perspective of feasibility of training children in an institution setting. An interview schedule will be developed for interviewing staff.
Publication plans: On completion, study will be published by California State Department of Mental Hygiene.
Duration: January 1962-June 1963.
Principal investigators: Paul W. Thormahlen (Ed.D. Candidate), School Principal, Allen H. Middleton, M.A., Research Assistant, and Margaret Stanford, Ph.D., Clinical Psychologist, Sonoma State Hospital, Eldridge, Calif.
Cooperating group: Research Division, California State Department of Mental Hygiene.

16-S-28 POPULATION MOVEMENT STUDY

Purpose: To study the processes of admission, interaction on the wards, release, escape or unauthorized absence, and post-release employment, adjustment, etc., of mentally retarded patients of the Pacific State Hospital.
Methods: Examination of admission records and processes, sociological and anthropological methods of observation, development and use of a factor-pure test battery to measure abilities of the subjects, etc.
Publication references: Training School Bulletin 58:2: 74-76, August 1961.
Duration: June 1957-August 1962.
Principal investigators: Harvey F. Dingman, Ph.D., Research Specialist III, and George Tarjan, M.D., Superintendent and Medical Director, Pacific State Hospital, P. O. Box 100, Pomona, Calif.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-S-29 DATA PROCESSING IN MENTAL DEFICIENCY

Purpose: A series of research projects in mental deficiency made possible through use of automation and medical records.
Subjects: Wards of the Pacific State Hospital.
Methods: Data is transferred from precoded medical record forms to punched cards or magnetic tape which are then processed automatically to give selected information on patient treatment, medical problems, incidence of communicable diseases and epidemics, estimates of patient susceptibility to diseases, prediction of construction needs, etc.
Publication references: Medical Record News, April 1962.
Duration: June 1960-May 1963.

Principal investigators: Harvey F. Dingman, Ph.D., Research Specialist III, and George Tarjan, M.D., Superintendent and Medical Director, Pacific State Hospital, P. O. Box 100, Pomona, Calif.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Physically handicapped

16-T-1 BRITISH COLUMBIA RECORD LINKAGE STUDY

Purpose: (1) To develop a facility for studying the reproductive histories of families with handicapped children (to detect differentials of fertility) as compared with families not having handicapped children. (2) To organize the records so that other follow-up studies can be done (e.g., of death and handicap in twins, empiric risks in subsequent sibs, etc.).
Methods: Computer "linkages" of records of live births, stillbirths, handicapped children, and child deaths into family groups using the marriage record of the parents where these are present in the files. Complete records for a population of greater than 10^6 people, from 1946 onward (about 10,000 marriages and 40,000 births per year).
Publication references: Family Linkage of Vital and Health Records, Atomic Energy of Canada Limited, July 1957 (reprinted August 1961); A Plan for the Study of Fertility of Relatives of Children Suffering from Hereditary and Other Defects, Atomic Energy of Canada Limited, November 1957 (reprinted December 1960); Canadian Journal of Genetics and Cytology 1:1:13-15, July 1959; Science 130:3381:954-959, October 16, 1959: Eugenics Quarterly 9:1:25-35, March 1962: etc.
Duration: 1956-continuing.
Principal investigator: Howard B. Newcombe, Ph.D., Head, Biology Branch, Atomic Energy of Canada, Ltd., Chalk River, Ont.
Cooperating group: Dominion Bureau of Statistics.

16-T-2 REHABILITATION OF CHILDREN WITH SPINA BIFIDA MANIFESTA AND MYELOMENINGOCELE

Purpose: To evaluate the muscle weakness, sensory losses, urological problems, and learning disabilities of children with myelomeningocele.
Subjects: 100 children with this congenital anomaly.
Duration: June 1962-May 1964.
Principal investigator: Chester A. Swinyard, M.D., Ph.D., Director, Children's Division, Institute of Physical Medicine and Rehabilitation, New York University Medical Center, New York, N.Y.

16-T-3 RESIDUAL BRAIN IMPAIRMENT IN PREMATURE CHILDREN

Purpose: To investigate the psychological, medical, and neurological effects of prematurity in very light weight premature children.
Subjects: Premature children from one month up to 15 years with appropriate controls.
Methods: Children will be studied medically, psychologically, and neurologically to determine presence of minimal brain damage, and to develop techniques for detecting these conditions early.
Publication plans: Data expected to be published.
Duration: January 1963-January 1965.

Principal investigators: George K. Yacorzynski, Ph.D., Professor and Head, Division of Psychology, Jerome Cohen, Ph.D., Associate Professor, and Jack Arbit, Ph.D., Associate, Department of Neurology and Psychiatry, Northwestern University Medical School, 303 E. Chicago Ave., Chicago 11, Ill.
Cooperating group: Michael Reese Hospital.

16-T-4 PSYCHOLOGICAL IMPLICATIONS OF CRYPTORCHISM

Purpose: To study the psychological aspects of cryptorchism. There has been little work done in this area, but the existence and importance of the psychological impact of this disorder upon the child and his family is generally well recognized.
Subjects: Two groups of children: (1) children with cryptorchism before any surgical intervention; (2) children who had orchiopexy done at least one year before being seen in study.
Methods: Parents of children will be interviewed in detail by a psychiatric social worker and information will be sought about child's physical, emotional and social development, his performance at school, at home and at play. Parents will be encouraged to express their feelings about the child's disability and their reaction to it. Child will be seen by a child psychiatrist with former training in pediatrics. Direct and indirect techniques commonly used in child psychiatry will be utilized to obtain a personality profile of the child. Child will be encouraged to draw a man, a woman, and the inside of the body. These drawings will be independently evaluated by a psychologist in order to detect any possible distortions of the child's body image.
Duration: November 1961-November 1962.
Principal investigators: Leon Cytryn, M.D., Fellow in Psychiatry, Department of Psychiatry, Eileen Cytryn, M.S.W., Psychiatric Social Worker, Research Foundation of the Children's Hospital of the District of Columbia, 2125 13th St., N.W., Washington 9, D. C.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-T-5 PERCEPTUAL CLOSURE AND CONSTANCY IN DEAF CHILDREN

Purpose: To examine effects of deafness on visual organizing processes in adolescent boys, using simple perceptual techniques. Since fundamental processes in perception are largely related to and determine overt behavior, an understanding of perceptual dynamics would help clarify the relatively more complex problems of personal and social adjustment of deaf children.
Subjects: 51 organically deaf adolescent boys and 51 nondeaf adolescent boys, from residential secondary schools in New Jersey. Except for deafness, the two groups were essentially similar.
Methods: Administration of two tests: Taylor Perceptual Closure Scale (consists of "Boy" and "House" subscales which have 26 mm. gaps in the line drawings; subjects are to copy the figures with the gaps) measuring a tendency to complete incomplete configurations during reproduction; Frenkel-Brunswik Scale which measures perseveration tendencies (consists of 10 cards of which the first is clearly a dog and the tenth clearly a cat; intermediate cards are gradual transitional forms. Subjects identified each card, one at a time).
Findings: The hypotheses were supported: deaf subjects closed open configurations and perseverated in initial perceptual responses significantly more than nondeaf subjects, supporting the general contention that an auditory handicap has generalized rigidifying effects manifest in other sensory modalities.
Publication plans: Submitted to Journal of Speech and Hearing Disorders.
Duration: 1960-1961.
Principal investigators: Irving A. Taylor, Ph.D., Associate Professor of Psychology, San Fernando Valley State College, Northridge, Calif., and Martin H. Wodin, Ph.D., Tappan Zee High School, Orangeburg, N. Y.

16-T-6 PERCEPTUAL-MOTOR DEVELOPMENT OF CHILDREN WITH SEVERE CEREBRAL DYSFUNCTION

Purpose: To evaluate possible effects of basic motor and visual perceptual training on children who are diagnosed as cerebral palsied, mentally retarded, epileptic, and/or emotionally disturbed.
Subjects: 16 children who displayed symtoms of organicity and were diagnosed as stated above--8 children in control and 8 in experimental groups, C.A.'s 8-11 to 18-0.
Methods: Each subject was evaluated at the beginning of the study by individual psychological assessment, optometric evaluation, educational evaluation, medical assessment, motor assessment, social and developmental case history. Each subject will be re-evaluated at the end of the study through the same methods. In addition to written report, visual recordation is being done on motion picture film.
Findings: A statistical analysis of two of the preliminary assessments, Bobath Motor Assessment and Test of Basic Form Perception, revealed that selection of children for the two groups seems to be adequate.
Publication plans: Definite dates for publication have not yet been set. Film and statistical data should be ready for release in 1963.
Duration: October 1961-spring 1963.
Principal investigators: Caro Hatcher, Ed.D., Certified Psychologist, Eileen Lai, O.T.R., B.S., Occupational Therapist, and J. Michael Siepp, B.A., Coordinator of Research, Spastic Children's Foundation, 1307 W. 105th St., Los Angeles 44, Calif.

16-T-7 STUDIES ON ASTHMATIC CHILDREN

Purpose: To study: (1) iodotherapy and thyroid function in children; (2) childhood asthma and steroid therapy as factors influencing growth; (3) role of anabolic steroid therapy in promoting growth; and (4) somatic and environmental factors in the evaluation and progress of childhood asthma.
Subjects: 150 asthmatic children in residence at Children's Asthma Research Institute and Hospital.
Methods: Clinical and laboratory observations.
Publication references and plans: Journal of Allergy 32:69-81, 1961; 32:420-434, 1961. American Journal of Diseases of Children 99:428-436, 1960, and article in press.
Duration: 1958-1961.
Principal investigator: Constantine J. Falliers, M.D., Director of Clinical Services, Children's Asthma Research Institute and Hospital, 3401 W. 19th Ave., Denver 4, Colo.
Cooperating group: University of Colorado Medical Center.

16-T-8 THE MATURATION OF INFANTS CONFINED TO ORTHOPEDIC CASTS AND SPLINTS

Purpose: To determine if casts or splints worn between ages of four to eight months have any effect on the normal course of development as measured at eight months.
Subjects: 18 infants of Philadelphia National Institute of Neurological Diseases and Blindness Perinatal Research Sample, all normal except for orthopedic correction; normative group of 200 infants drawn from same sample.
Methods: Bayley first year mental and motor development scales given to all infants at age eight months as part of NINDB data collection. Average performance expectation, item by item, established on normative group of 200. Scores of 18 infants confined to casts and splints compared to scores of normative group.
Findings: In all areas of development--mental, fine motor, and gross motor--the infants who had worn casts and splints were able to meet or exceed average performance expectations.
Publication plans: Paper will be submitted to an orthopedic journal.
Duration: January 1961-September 1962.
Principal investigator: Jean F. Stein, Ph.D., Psychologist, Woods Schools, Langhorne, Pa.
Cooperating group: Data from National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-T-9 INTELLECTUAL AND PERSONALITY FUNCTIONING IN PHYSICALLY DISABLED CHILDREN EVALUATED DURING AN INITIAL SCHOOL EXPERIENCE

Purpose: To evaluate and analyze the intellectual and personality functioning of a group of physically disabled children who are being given the opportunity of attending a full-time elementary school program after years of having received no more schooling than a few hours per week of homebound instruction.
Subjects: Approximately 25 physically disabled children ranging in age from 7 to 14 years; disabilities include paraplegics and various orthopedic problems.
Methods: Intellectual functioning will be evaluated by standard intelligence and academic achievement tests. Personality functioning will be determined by projective psychological tests, including Rorschach, House-Tree-Person, and Brown Personality Inventory for Children. Tests will be administered during first month of school and then readministered at the end of a year's school experience to evaluate intellectual and personality changes. Comparisons will be made with a normal control group and available normative data reported in the literature.
Publication plans: Papers will be submitted to appropriate professional journals.
Duration: Fall 1962-fall 1963.
Principal investigator: Edmund C. Neuhaus, Ph.D., Director of Psychological and Educational Services, Human Resources Foundation, Albertson, N. Y.

16-T-10 PSYCHOSOCIAL CORRELATES OF IRON DEFICIENCY ANEMIA IN CHILDREN

Purpose: To study iron deficiency anemia in young children in relation to feeding practices, psychological care, and socio-economic factors. It is hoped that a profile in some depth will be gained of the environmental circumstance and feeding experiences of children with iron deficiency anemia. Further, data will be used to plan an encompassing investigation into the mutual interaction of feeding practices, iron deficiency anemia and later character development and distortion in children.
Subjects: Basic sample consists of all children (144) with iron deficiency anemia hospitalized in one year at Children's Hospital.
Methods: Hospital record analysis of 113 items was done on sample. Fifty of the cases will be chosen by random numbers for home visit interviews to gather intensive data related to feeding practices and psychological interaction as well as to perform hemoglobin determinations. Seventy-five inpatients of the hospital will be used as an approximate control group for the original sample. Data will be analyzed for anecdotal significance and with statistical tests.
Duration: 1962-not reported.
Principal investigators: Sidney L. Werkman, M.D., Research Associate, Department of Psychiatry, Research Foundation of Children's Hospital of the District of Columbia, and Thomas Skelly, Research Assistant, George Washington University Medical School, Washington, D. C.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-T-11 CONSCIENCE DEVELOPMENT IN DEAF CHILDREN

Purpose: To study deaf children's responses to four Piaget stories involving moral judgments.
Subjects: 30 children attending the Lexington School for the Deaf, New York City.
Methods: Individual interviews with the children. Their responses to the stories will be classified into one of Piaget's levels of development and compared with control group.
Publication plans: Journal article.
Duration: January-June 1963.
Principal investigator: Martin L. Nass, Ph.D., Assistant Professor, Educational Clinic, Brooklyn College, City University of New York, Brooklyn 10, N. Y.
Cooperating groups: Lexington School for the Deaf; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-T-12 SMILE AND FEAR OF STRANGERS IN CONGENITALLY BLIND INFANTS

Purpose: To determine if vision is or is not prerequisite to normal smiling and fear of strangers in infancy.
Subjects: Congenitally blind infants have been observed directly, and retrospective data have been gathered from 13 families.
Methods: Periodic observations and films are made of the blind infants; parents of older blind children are interviewed.
Findings: All children studied smiled as infants. Many smiled somewhat later than normal sibs, usually to auditory stimuli. There are fewer reports of fear of strangers in the first year in blind than in seeing sibs.
Duration: June 1962-March 1963.
Principal investigator: Daniel G. Freedman, Ph.D., Research Specialist, Langley-Porter Neuropsychiatric Institute, San Francisco, Calif.
Cooperating group: California State Department of Mental Hygiene.

16-T-13 CONSTRUCTION AND STANDARDIZATION OF A BATTERY OF BRAILLE SKILL TESTS

Purpose: To construct and standardize a battery of tests for measuring the braille skills needed in reading and number work. The proposed battery of tests is not concerned with reading and mathematical skills as such, but with the ability to use the braille literary code and certain systems of braille mathematical notation.
Methods: Two sets of tests are to be constructed--one in the area of "braille reading skills" and the other in the area of "braille mathematical skills." The tests of "braille reading skill" will be based upon grade II braille. There will be three overlapping levels in each area with two equivalent forms at each level. This will provide a total of 12 tests in the completed battery. Each test will be divided into subtests to facilitate diagnostic evaluation of relative strengths and weaknesses in braille skill. These tests will provide teachers of the blind with objective measurement data regarding a student's overall development in braille as well as provide a means for analyzing the student's strengths and weaknesses.
Duration: July 1962-December 1963.
Principal investigators: Richard W. Woodcock, Ed.D., Associate Professor of Special Education, and Stanley E. Bourgeault, A.M., Instructor in Special Education, Colorado State College, Greeley, Colo.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

THE CHILD IN THE FAMILY

Family background and relations

16-U-1 SEX RATIO OF OFFSPRING OF SELECTED POPULATION GROUPS

Purpose: To determine sex ratio of offspring of subjects selected for special attributes (i.e., presence of disease, ethnic background, maturation pattern).

Subjects: Patients in a prenatal and a specialty clinic.

Methods: Sex ratio of offspring of selected subjects determined through direct questioning and hospital records.

Duration: 1960-1963.

Principal investigator: Robert W. Hillman, M.D., M.P.H., Professor, Department of Environmental Medicine and Community Health, State University of New York Downstate Medical Center, 450 Clarkson Ave., Brooklyn 3, N. Y.

Cooperating groups: Department of Obstetrics, Brooklyn Hospital; Red Hook Health Center Nutrition Clinic, New York City Department of Health.

16-U-2 DISTRIBUTION OF SEXES WITHIN HUMAN FAMILIES

Purpose: To determine whether there is correlation between the sex of adjacent sibs.

Subjects: More than 75,000 family records that give information on the date of birth of father and mother, the sex and date of birth of each child up to a total of nine, and the total number of children.

Methods: Analysis will be carried out by the use of conditional probabilities. In this way, any effect due to correlation between the sex of adjacent sibs can be separated from effects that might be produced by: variation from birth to birth, within a family, of the probability that a child will be a male; variation from one family to another of the probability that a child will be a male; and limitation of family size after a certain preferred combination of sexes has been obtained.

Duration: January 1962-December 1963.

Principal investigators: Colin White, M.B., B.S., Professor of Public Health (Biometry), and Richard A. Greenberg, Instructor in Biometry, Department of Epidemiology and Public Health, Yale University School of Medicine, New Haven, Conn.

Cooperating group: National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-U-3 THE RELATIONSHIP OF EMOTIONAL ADJUSTMENT AND ATTITUDES TO THE COURSE AND OUTCOME OF PREGNANCY, AND THEIR MODIFIABILITY THROUGH A PROGRAM OF EXPECTANT PARENT EDUCATION

Purpose: To determine, in an obstetric population in a group practice medical care program, the extent to which emotional adjustment and attitudes may affect the course and outcome of the maternity cycle. To determine, for a sample of this obstetric population, the extent to which a program of group expectant parent education can modify emotional adjustment and attitudes and affect the course and outcome of the maternity cycle.

Subjects: 600 to 1,000 women first seen early in pregnancy, followed through the maternity cycle.

Methods: A series of questionnaires (to be completed by the subjects) and rating scales (to be completed by obstetric and pediatric personnel) are being developed to evaluate women's attitudes and behavior early in pregnancy, late in pregnancy, during labor and delivery, and during the postpartum period. Measures are also being developed to evaluate the status of the babies at birth and during a three-month follow-up.

Duration: July 1961-June 1964.

Principal investigators: Edwin F. Daily, M.D., Vice President (Medical), Elaine R. Grimm, Ph.D., Research Psychologist, and Wanda R. LeRoy, R.N., Nurse Educator, Health Insurance Plan of Greater New York, 625 Madison Ave., New York 32, N. Y.
Cooperating groups: Jamaica Medical Group; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-U-4 MOTHER-INFANT DREAM PATTERNS

Purpose: An attempt to obtain normative data regarding cyclic variations in mother-infant nocturnal behavior.
Methods: Mothers and newborn infants will be studied in an EEG laboratory one night each week for one year. Rapid eye movements, body movements and electroencephalograms will be recorded on both mother and infant. Behavioral observations will be made in terms of feeding patterns and other aspects of the mother-infant relationship. Normal mothers (both nursing and nonnursing) will be studied. Mothers with colicy infants and anxious mothers will be observed after normative data have been obtained.
Duration: 1962-1963.
Principal investigators: Boyd K. Lester, M.D., and Chester M. Pierce, M.D., Assistant Professors, Department of Psychiatry, Neurology and Behavioral Sciences, University of Oklahoma School of Medicine, 800 N.E. 13, Oklahoma City 4, Okla.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-U-5 EFFECTS OF SEPARATING TWO YEAR OLD CHILDREN FROM THEIR MOTHERS

Purpose: To study changes over time in the behavior of young children separated from their families and to attempt to answer the following questions: To what extent can differential reactions during the first week of separation be understood in terms of previous family background? To what extent is the child's behavior both during separation and following reunion with his parents a function of the length of separation? How does the child typically cope with the stress of separation? How are changes in the child associated with possible changes in the family, expecially his mother?
Subjects: Sample of 10 children, aged 16 to 30 months, during the first three weeks of separation in a residential nursery; a similar control group of 10 children living at home.
Methods: Use of categories to quantify observed behavior in the nursery, in the home after reunion, and in doll play sessions; clinical impressions of behavior of the child and also of home and family.
Publication plans: Monograph in 1964.
Principal investigators: Christoph M. Heinicke, Ph.D., Research Associate, Psychiatric Clinic, Mt. Zion Hospital and Medical Center, 1600 Divisadero St., San Francisco 15, Calif. (Formerly, Tavistock Child Development Research Unit), and Miss Ilse Westheimer, Psychiatric Social Worker, Child Guidance Training Centre, London, England (Formerly, Tavistock Child Development Research Unit). (Reported by John Bowlby, M.D., Director, Tavistock Child Development Research Unit, Tavistock Clinic, 2 Beaumont St., London W.1, England.)

16-U-6 COMMON RESPONSES OF YOUNG CHILDREN TO SEPARATION

Purpose: To provide illustrations from case material of common responses of young children to short and long separations from their mothers and to reunion with them afterwards; to discuss theoretical problems raised by these responses.
Subjects: Children between two and four years undergoing short and long separations in residential nurseries and sanatoria.
Methods: Direct observation, with use of ciné records in some cases.

BEST COPY AVAILABLE

Publication plans: It is planned to publish in two volumes in 1964.
Duration: 1951-1964.
Principal investigators: John Bowlby, M.D., Director, and James Robertson, Senior Project Officer, Tavistock Child Development Research Unit, Tavistock Clinic, 2 Beaumont St., London W.1, England.

16-U-7 TRADITIONAL AND EMERGENT FAMILY TYPES AND THEIR RELATION TO FAMILY INTERPERSONAL RELATIONSHIPS

Purpose: To discover whether the quality of the husband-wife, parent-child, and child-peer relationships vary with respect to variations in the authoritarian structure of families. In particular, are the interpersonal relationships of higher, or lower, quality in patriarchal families as compared to equalitarian families?
Subjects: (1) 1956 survey of 150 midwest Mennonite families; (2) 1961 survey of 215 rural families in northern Indiana; (3) 1962 survey of 600 urban and rural families in Germany; and (4) projected survey in 1963-64 of 500 additional American urban and rural families.
Methods: Questionnaires being administered by the researcher in personal contact with respondents. The 1956 study (for doctoral dissertation) involved the completion of questionnaires by husband, wife, and oldest child in each family. Subsequent studies rely on questionnaires completed in school by 13 and 14 year old children.
Findings: Evidence is accumulating that the patriarchal authority structure is less conducive than equalitarian patterns to good interpersonal relations in families. The more traditional the family patterns, the lower the average husband-wife, child-parent, and child-peer scale scores. Evidence to date also indicates that child deviancy and neurotic symptoms are somewhat more frequent in authoritarian than in equalitarian families.
Publication references: Marriage and Family Living 23:3:247-252, August 1961.
Duration: 1961-August 1964.
Principal investigator: J. Howard Kauffman, Ph.D., Professor of Sociology, Goshen College, Goshen, Ind.
Cooperating groups: Goshen College and Mennonite Research Foundation in earlier phases.

16-U-8 PARENT-CHILD RELATIONSHIPS AND ADOLESCENT'S DESIRE TO LEAVE HOME

Purpose: Hypotheses: (1) to the degree that early and adolescent experience of personal parent-child relations have been inadequate and unsatisfying, adolescents tend to want to leave home; to the degree that these relations have been adequate and satisfying, adolescents tend not to want to leave home; and (2) early and adolescent experience of parent-child relations of a nondemanding, nonintrusive, but adequately nurturant, sort would have little or no effect upon the adolescent's desire to leave home.
Subjects: 20 male and 20 female graduating students selected randomly from each of five Salt Lake City high schools.
Methods: Subjects were administered two questionnaires, one concerning parent-child relations and one designed to elicit pertinent biographical data; statistical correlations of information received on questionnaires.
Duration: February-July 1962.
Principal investigator: Henry van der Velden, Ph.D. Candidate, Department of Sociology, University of Utah, Salt Lake City, Utah.
Cooperating groups: Salt Lake City Public Schools; Catholic Diocese of Salt Lake City.

16-U-9 PARENT BEHAVIOR AND THE DEVELOPMENT OF GUILT REACTIVITY IN THE CHILD

Subjects: The entire sixth grade population of the public school system of Auburn, New York--328 subjects living with both parents at time of study.
Methods: Structured questionnaire (child reports on parental behavior in the dimensions of nurturance-indifference and discipline). An inventory scale of transgression-retribution anxiety. A projective story completion measure of transgression-instigated guilt reactivity. A Hartshorne and May "test of deceit."

Publication references and plans: Psychological Reports 10:2:357-358, April 1962; another article in press. Other publications planned.
Duration: January 1959-September 1963.
Principal investigator: Sanford M. Unger, Ph.D., Research Psychologist, Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.

16-U-10 INTRAFAMILY TRANSMISSION OF CRITICAL JUDGMENT

Purpose: To investigate the degree to which parental evaluation (critical judgment) of television is transmitted to the child; to adapt techniques (previously used with adults) for measuring the evaluative attitudes of children; and to examine extent to which children adopt the critical judgment of their parents toward television. Central hypothesis is that child adopts parental attitudes with regard to televiewing. This is based on proposition that it is neither program content nor amount of viewing that provide the central impact upon the child. Rather, it is the manner in which content and act are supervised and evaluated by his parent. The meaning that television has for the child is the meaning that his parent gives it. Further, it seems likely that critical evaluation of mass media may reflect other modes of child rearing on the part of the parents, and other areas of behavior on the part of the child.
Subjects: 100 fourth and 100 seventh grade children.
Methods: On the basis of subjects' replies to the Semantic Differential, children will be divided into four quartiles according to their evaluation of television. Data will be collected from parents by use of the same techniques. In particular, both parents of the 25 most critically evaluative children (upper quartile) and both parents of the 25 least critically evaluative children (lower quartile) will be contacted.
Duration: January 1962-June 1963.
Principal investigator: Robert D. Hess, Ph.D., Associate Professor and Chairman, Committee on Human Development, University of Chicago, Chicago 37, Ill.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-U-11 FAMILY INTERACTION STUDIES USING REVEALED DIFFERENCES

Purpose: Strodtbeck has previously studied decision-making as related to cultural role expectations of Texan, Mormon, and Navaho husbands and wives using technique of revealed differences. He also investigated transmission of achievement-related attitudes in second generation Italian and Jewish families having adolescent sons. Sangree replicated this study with Japanese-American families. In the present research, revealed differences will be used in three ways: (1) to explore ways in which power and supportiveness patterns in families with highly gifted children, male and female, differ from those in families with more average children, and to relate dyadic interaction to that in three-person groups; (2) to investigate power-supportiveness patterns in female-based households to test the hypothesis that male offspring in such households develop sex-identification problems leading to exaggerated attempts to demonstrate masculinity and to juvenile delinquency; and (3) to study the relationship of family supportiveness and power patterns to political ideology.
Methods: Family members are asked to discuss, and to achieve consensus on, value statements about which, on the basis of their individual responses, it can be shown they disagree. The protocols arising from the interaction over these revealed differences are scored using Bales' categories and other content systems to ascertain relative power and supportiveness of family members.
Duration: March 1962-February 1963.
Principal investigators: Fred L. Strodtbeck, Ph.D., Associate Professor, and Mayer N. Zald, Instructor, Departments of Sociology and Psychology; Anthony Kallet, Ph.D., Post-doctoral Fellow, and Robert Gordon, Research Assistant, Department of Sociology, University of Chicago, Chicago 37, Ill.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-U-12 DESISION-MAKING IN NORMAL AND PATHOLOGIC FAMILIES

Purpose: To investigate the basic characteristics of the family decision-making process and its relationship to psychopathology in the individual and in the family group.
Subjects: Family triads to be categorized by means of operational divisions into normal and pathologic groups. In the pathologic group, subgroups would be considered more specifically, particularly the schizophrenia-producing families and the delinquency-producing families.
Methods: Two methods to be followed: (1) the family members are requested to strive toward some common family decision about hypothetical situations; (2) they are requested to strive toward the telling of a story that integrates some TAT cards. The interactions of the above method will be taped and classified and summarized.
Publication plans: Journal publication anticipated.
Duration: June 1962-May 1964.
Principal investigators: Antonio J. Ferreira, M.D., Psychiatrist and Research Consultant, and William D. Winter, Ph.D., Associate Professor of Psychology, San Jose State College, San Jose, Calif.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-U-13 CHILDREN OF SCHIZOPHRENIC PARENTS

Purpose: To study the psychosocial adjustment of children of schizophrenic parents.
Subjects: Children having a parent who has been diagnosed as schizophrenic. Control groups: (1) children from same classrooms as study children, and (2) children having one parent with chronic physical disability.
Methods: Psychiatric interviews, psychological tests, behavior scales.
Duration: July 1962-not reported.
Principal investigators: Arnold R. Beisser, M.D., Chief of Professional Education, and Norbert Glasser, Ph.D., Clinical Psychologist II, Metropolitan State Hospital, 11400 S. Norwalk Blvd., Norwalk, Calif.

16-U-14 THE "CRIME-SPOUSE" AND HER FAMILY

Purpose: It is hypothesized that there exists an abnormal psychopathology in the families of law offenders.
Subjects: Patients on parole from state correctional institutions, their wives and children.
Methods: A complete profile study of members of the offenders' families, including the children, by means of anamneses, process recordings of treatment, and a psychodiagnostic battery of tests.
Publication plans: Publication is planned.
Duration: September 1962-September 1963.
Principal investigator: Hans A. Illing, M.S.W., Ph.D., Senior Psychiatric Social Worker, Parole Outpatient Clinic, California State Department of Corrections, 107 S. Broadway, Los Angeles 12, Calif.

16-U-15 THE EFFECT OF FATHERS' ALCOHOLISM ON THE ADJUSTMENT OF CHILDREN

Purpose: (1) To compare children of alcoholics with those of nonalcoholics in respect to prevalence of social and psychological problems; (2) to develop an instrument which will measure child adjustment; and (3) to examine family life correlates.
Subjects: 106 mothers who were wives of alcoholics who had attended one or more meetings of Alanon Family Groups in Seattle since 1952, and who were the subjects of a larger project on Alcoholism and the Family; 67 wives of nonalcoholics, matched for age, length of marriage, number of children, education, and area of residence. Subjects were divided into experimental and replication groups.

Methods: Child Adjustment Questionnaire; MMPI evaluation of mother; Interpersonal Check List in which respondent rated self and husband under conditions of drunk-sober or, for nonalcoholics, things going smoothly or not smoothly; interviews on family adaptations to alcoholism, drinking history, parental childhood experience, parent-child relationships at present; marital adjustment scales.
Findings: Children of alcoholics had more problems in more areas than children of nonalcoholics. Number of problems is related to mother's disturbance (MMPI), to aspects of father's drinking pattern, to role default by parents, to realistic education of the child about alcoholism.
Publication plans: Article to be submitted to journal early in 1963.
Duration: 1959-1963.
Principal investigators: Gerald Johnston, B.S., Medical Student Research Trainee, Joan K. Jackson, Ph.D., Research Associate Professor, and Kate L. Kogan, Ph.D., Clinical Assistant Professor, Department of Psychiatry, University of Washington School of Medicine, Seattle 5, Wash.

16-U-16 HEMIPLEGIA AND SOCIAL STRUCTURE

Purpose: To study patterns of adjustment of two contrasting social institutions--family and rehabilitation center--to the hemiplegic (stroke) patient. An effort will be made to identify patterns of adjustment of the family unit to role reorganization because, often, children of the hemiplegic patient find themselves bearing much of the responsibility in their families.
Subjects: 40 families and patients who have experienced a cerebral vascular accident; personnel of a rehabilitation center.
Methods: Case analysis of patterns of family adaptation and participant observation at the rehabilitation center.
Findings: Adjustment of family is related to previous structure, extent of role change, and necessary substitutions which often result in a family crisis. Status and role concerns of rehabilitation specialists often result in treatment arrangements that are dysfunctional for patients.
Publication plans: Study will be submitted for publication.
Duration: September 1961-October 1962.
Principal investigator: Martin D. Adler (Ph.D. Candidate, University of Pittsburgh), Executive Director, Southeastern Community Guidance Association, 4232 Brownsville Rd., Pittsburgh 27, Pa.

16-U-17 FAMILY HEALTH AND ILLNESS BEHAVIOR

Purpose: To investigate the effects of family patterns of interaction on the illness behavior of family members. The concept of illness behavior is concerned with the way symptoms are perceived, evaluated, and acted upon by a person who recognizes pain, discomfort or other signs of malfunction (see Journal of Chronic Diseases 15:189-194, February 1962). Concern is with the influence upon illness behavior of each of the following: child-rearing practices relevant to health, situational pressures upon the family, role relationships within the family and family definitions of health resources.
Subjects: Sample includes 350 mothers and their children, surveyed independently. Children in fourth and eighth grades were selected through the school census.
Methods: Data were collected through interviews with mothers in their homes and questionnaires administered to children in the classrooms. Other data obtained include family health logs, teachers' ratings of children's inclinations toward stoicism and hypochondriasis, school attendance records, etc.
Duration: September 1961-September 1963.
Principal investigator: David Mechanic, Ph.D., Associate Professor, Department of Sociology, University of Wisconsin, Madison, Wis.
Cooperating group: Health Information Foundation.

16-U-18 CHILD AND FAMILY FACTORS IN ACCIDENTAL INJURY

Purpose: Investigation of human and environmental factors associated with accidental injury in preschool children has proved important, since traditional methods of accident prevention in this age group are not only inadequate, but the risk of disability and death are much greater.
Subjects: One to six year old hospitalized children studied prospectively after admittance to the Children's Hospital Medical Center for accidental injury. A comparison group of children and families chosen at random from among the Family Health Program population at the medical center.
Methods: Hospital and home visiting by a professional team of pediatrician, social worker, nursery school teacher and ancillary workers, using interview schedules and developmental testing.
Findings: Highly significant association with many developmental and family life stresses immediately preceding injury was found. While the mechanism of action was not always evident, children's psychophysiologic states and inadequacy of supervision coupled with social disorganization patterns appeared to forge the links leading to accidental injury.
Publication plans: Publication in near future.
Duration: March 1961-March 1962.
Principal investigator: Roger J. Meyer, M.D., M.P.H., Assistant Professor of Community Medicine and Epidemiology, and Director, Family Care Unit, University of Vermont College of Medicine, 25 Colchester Ave., Burlington, Vt. (Formerly, Director, Child and Family Health Division, Children's Hospital Medical Center, and Harvard Medical School, Boston, Mass.
Cooperating group: Public Health Service, U. S. Department of Health, Education, and Welfare.

Child-rearing attitudes and practices

16-V-1 ANTECEDENTS OF SOCIAL REINFORCEMENT

Purpose: To investigate child-training procedures which lead to enhanced effectiveness of social reinforcers on a motor-conditioning task.
Subjects: 60 seven to eight year old children and their mothers.
Methods: Children individually tested in laboratory learning situation, and indices of: (1) response to social reinforcers; and (2) persuasibility obtained. Mothers given short (30-minute) semistructured interview regarding particular child-training practices followed with these children.
Findings: To whatever extent parental training procedures affect a child's response to social reinforcers, their influence is mediated by highly specific experiences. The single clearest antecedent of social reinforcer effectiveness was the frequency of the father's use of praise as a means of control. The less frequent a child's exposure to paternal praise, the greater his response to social reinforcers in the laboratory.
Publication plans: To be published.
Duration: March 1961-December 1962.
Principal investigator: Robert B. Cairns, Ph.D., Assistant Professor of Psychology, Indiana University, Bloomington, Ind.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-V-2 NURTURANT POWER AND MODEL ATTRIBUTES OF PARENTS AND THE CONSISTENCY OF BEHAVIOR IN ADOLESCENTS

Purpose: To clarify the relationships between: (1) the relative reinforcing properties of the mother and father as given by their relative degree of nurturance toward the child; (2) the

relative personality attributes which the parents present as models for imitation by the child; and (3) the consistency of the child's behavior in interpersonal situations as well as the consistency the child shows between his anticipations of social rewards and punishments and the behaviors manifested socially.
Subjects: College undergraduates at the University of Iowa, about 60 of each sex.
Methods: The measurement of parental nurturance, model attributes, and the two consistency variables was accomplished psychometrically. Each measure represents the subjects' perception of the parents or of himself.
Findings: Early findings suggest that systematic relationships do exist between the two parent variables, presumed to be antecedents, and the two measures of behavioral consistency. Further, these relationships vary as a function of sex of the child. Since both consistency measures have been shown to be related to maladjustment in adolescents, it is anticipated that the results will have implications in this regard.
Publication plans: Results will be submitted to Child Development, Journal of Abnormal and Social Psychology, Journal of Personality, or Journal of Consulting Psychology.
Duration: April 1962-September 1962.
Principal investigator: Alfred B. Heilbrun, Jr., Ph.D., Associate Professor of Psychology, State University of Iowa, Iowa City, Iowa.

16-V-3 PERSONALITY ATTRIBUTES ASSOCIATED WITH VARIOUS MECHANISMS OF MASCULINE IDENTIFICATION

Purpose: To evaluate the personality characteristics of boys whose masculine identification is based on any of the three mechanisms: (1) nurturance together with punitiveness of the father, (2) warmth and nurturance of the father, and (3) punitiveness of the father. To determine whether boys who rate high in masculinity and perceive their father as nurturant have more positive self-concepts and personality characteristics, as compared with those who also rate high in masculinity but perceive their father as either punitive or both punitive and nurturant.
Subjects: Three groups of kindergarten-age boys who rate high in masculinity and perceive their father as (1) nurturant, (2) punitive, and (3) both punitive and nurturant. All individuals will be white Americans, residents of Pittsburgh, belonging to intact families, and scoring in the highest quartile according to the measures of masculinity.
Methods: Analysis of variance will be performed to determine the significance of difference in personality characteristics and self-conceptions.
Duration: August 1962-May 1964.
Principal investigators: Rachel M. Inselberg, Assistant Professor, and Laura Searls, Research Assistant, Department of Home Economics, Carnegie Institute of Technology, Pittsburgh 13, Pa.
Cooperating group: Office of Education, U. S. Department of Health, Education, and Welfare.

16-V-4 IDENTIFICATION IN CHILDREN

Purpose: To investigate the relationship between structural and functional aspects of the family on the one hand and of identifications of offspring on the other. According to present but still tentative plans, the offspring's identification with his parents will be related to two antecedent conditions which will constitute the major sampling classification criteria: (1) the structure of the larger family (extended versus nuclear), and (2) the structure of the immediate (or nuclear) family (two parents versus one parent). Three intervening conditions will also be related to the offspring's parental identifications: (1) degree to which the family performs functions of integrating offspring into society and of socialization-education of the offspring; (2) resources of the family, and (3) exercise of parental power. The offspring's identification with his parents will be determined for both personality and role-related variables. Hypotheses relating structural and functional conditions to role and personality identification will be tested.
Duration: 1962-1964.
Principal investigator: Robert Francis Winch, Ph.D., Professor of Sociology, Northwestern University, Evanston, Ill.
Cooperating group: National Science Foundation.

BEST COPY AVAILABLE

16-V-5 BIRTH ORDER, PERSONALITY, AND CONFORMITY

Purpose: To test certain hypothesized relationships between a person's order of birth within his family, nature of child-rearing practices employed to rear him, relationships with his sibs, development of certain personality traits such as achievement, affiliation, anxiety, etc., and his conformity in a social influence situation.
Subjects: Approximately 400 persons in junior and senior high school in the Berkeley area, from one- or two-child families, divided into subgroups on the basis of sex, birth order, and sex of sib.
Methods: Data involve responses to questionnaire items, numerical scale scores, and indices of personality, socio-economic status, sib relationships, etc., as well as experimental measures of conformity. A questionnaire and letter were mailed to the home of each subject in the high school sample. Following return of the forms, subjects met in a large classroom for two separate testing sessions of about one hour each.
Publication plans: Probably a series of journal articles dealing with certain selected significant, yet independent, aspects of the entire project.
Duration: September 1961-June 1963.
Principal investigator: Edward E. Sampson, Ph.D., Assistant Professor, Department of Psychology, University of California, Berkeley 4, Calif. (Reported by Francena T. Hancock, Research Psychologist, Department of Psychology.)
Cooperating groups: Berkeley Unified School District; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-V-6 THE EFFECTS OF REARING BY GOVERNESS ON BIRTH ORDER AND CONFORMITY

Subjects: High school students.
Publication plans: A psychological journal.
Duration: June 1962-November 1962.
Principal investigator: Selwyn W. Becker, Ph.D., Assistant Professor of Psychology, Graduate School of Business, University of Chicago, Chicago 37, Ill.

16-V-7 EXPERIMENTAL STUDIES OF THE EFFECTS OF EARLY CHILD-REARING PRACTICES AND NURSERY SCHOOL EXPERIENCES ON THE INTELLECTUAL, SOCIAL, AND PERSONALITY DEVELOPMENT OF YOUNG CHILDREN

Purpose: To study intellectual, social, and personality development in preschool children as a function of: early child-rearing practices, experience in the nursery school setting, and experimental manipulations of specific intellectual and socio-emotional variables.
Subjects: 30 three year old children and their parents; 45 four and five year old children.
Methods: Longitudinal case study permits intensive and simultaneous study of patterns of variables and interactions between variables within individual children, as well as group comparisons of children receiving the experimental condition (nursery school attendance) and a control group. Children in longitudinal study are tested with such instruments as Stanford-Binet and Illinois Test of Psycholinguistic Abilities. Cross-sectional experimental studies are to be carried out with four and five year old children. Specific aspects (e.g., adult nurturance, control techniques) of child's environment will be manipulated in the laboratory nursery school setting. Other studies attempt to manipulate various aspects of intellectual functioning (e.g., inductive and deductive reasoning) by means of special training sessions. Child's status and progress are assessed before and after training and performance is compared with that of a control child who has had no special training experiences.
Publication plans: Findings will be published, but specific publication plans have not been formulated as yet.
Duration: September 1962-July 1963.
Principal investigators: Britton K. Ruebush, Ph.D., Assistant Professor of Child Psychology, and Shirley G. Moore, Ph.D., Associate Professor of Child Psychology, University of Minnesota, Minneapolis 14, Minn.
Cooperating group: University of Minnesota Graduate School.

16-V-8 SELF-HELP WITH FAMILY PROBLEMS

Purpose: To experiment with techniques of inducing low-education mothers to read simply written materials about child rearing, and to measure the effect of these materials upon their attitudes and child-rearing practices.
Duration: March 1962-March 1963.
Principal investigators: Donald J. Bogue, Ph.D., Director, Community and Family Study Center, and Margaret Peil, Ph.D. Candidate, University of Chicago, Chicago 37, Ill.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

SOCIAL, ECONOMIC, AND CULTURAL INFLUENCES

16-W-1 CHILD CARE IN CROSS-CULTURAL PERSPECTIVE

Purpose: Recent studies in some Communist countries and Western democracies on the care of children living away from their parents seem to have yielded very diverse results. Studies in the U.S.S.R. find institutional care of children to result in well-integrated, wholesome personalities; studies in the U. S. and Great Britain find evidence to the contrary. This study will attempt to determine by on-the spot observation the validity of the hypothesis that these discrepancies in research findings reflect the expectations of the adult in each of the social systems.
Duration: 1962-1963.
Principal investigator: Martin Wolins, D.S.W., Associate Professor, School of Social Welfare, University of California, Berkeley 4, Calif.
Cooperating groups: International Union for Child Welfare; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-W-2 PATTERNS OF CHILD REARING IN THE PHILIPPINES

Purpose: A cross-cultural study of attitudes and practices of parents in the Philippines. Research is designed to clarify the pattern of attitudes which parents hold and to relate these patterns to personality development in the Filipino. This will permit the evaluation of hypotheses concerning the impact of childhood experience on adult personality which have been formulated in other countries.
Subjects: Mothers of Philippine children in the area around Manila.
Methods: Reliance has been on structured interviews and on questionnaires, the latter used only where a satisfactory degree of literacy is present.
Publication references: The Filipino Child and Philippine Society, Philippine Normal College Press, 1961, available from Cellar Book Shop, Box 6, College Park Station, Detroit 21, Mich.
Duration: 1959-1963.
Principal investigators: George M. Guthrie, Ph.D., Professor of Psychology, Pennsylvania State University, University Park, Pa., and Pepita G. Jimenez, Doctoral Candidate, Pennsylvania State University (on leave from Philippine Normal College).
Cooperating group: Pennsylvania State University.

16-W-3 CHILD REARING IN GREECE

Purpose: To study patterns of child rearing in Greece, testing hypotheses regarding child rearing and child personality which emerged from earlier study (Child Rearing in Lebanon, Harvard Press. 1961).
Subjects: Mothers of five year olds in two cities and four villages of Greece.
Methods: Interviews with mothers. Interviews follow those of earlier study which were modeled after interviews used by Sears, Maccoby, and Levin in Patterns of Child Rearing.
Publication plans: Plan to publish a series of articles in American psychological journals.
Duration: June 1962-February 1963.
Principal investigator: Edwin T. Prothro, Ph.D., Professor of Psychology, American University of Beirut, Beirut, Lebanon.
Cooperating group: Social Science Research Council.

16-W-4 COMPETENT ADOLESCENTS IN PUERTO RICO: A CROSS-CULTURAL STUDY

Purpose: To test the cross-cultural validity of the Student TAT and to sharpen our theoretical formulations of coping behavior. It is proposed to discover how cultural attitudes, beliefs and practices affect patterns of coping behavior and personality development and the various resources and techniques of the Puerto Rican adolescents in adapting to new situations.
Subjects: A sample of 20 high school students selected from the University High School of the University of Puerto Rico. Six of these students came to the continental United States to study; the remainder enrolled at the University of Puerto Rico.
Methods: Group and individual interviews, Student TAT and additional psychological tests. By comparing preliminary findings of the Puerto Rican and NIMH samples, similarities and differences in anticipatory attitudes and activities characteristic of the two cultures were found. Further testing and interviewing is being conducted.
Duration: March 1961-March 1964.
Principal investigators: E. D. Maldonado-Sierra, M.D., Executive Director, Puerto Rico Institute of Psychiatry, Inc., Bayamon, Puerto Rico; George V. Coelho, Ph.D., Visiting Scientist, Adult Psychiatry Branch, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.

16-W-5 JAPANESE CHILDREN'S PERSONALITY DEVELOPMENT AND HOUSEHOLD COMPOSITION

Purpose: To investigate the effect of presence or absence of family members, especially grandparents, on children's personality development.
Subjects: 900 Japanese school children in the city of Fukuoka.
Methods: Questionnaires; interviews with parents (restricted sample).
Publication plans: Monograph or series of papers.
Duration: July 1961-July 1964.
Principal investigator: John L. Fischer, Ph.D., Associate Professor, Department of Sociology and Anthropology, Tulane University, New Orleans 18, La.
Cooperating groups: Research Institute of Comparative Education and Culture, Kyushu University; National Science Foundation.

16-W-6 FAMILY STRUCTURE, ACHIEVEMENT MOTIVATION, AND ECONOMIC GROWTH

Purpose: To study the relationship of family structure and socialization to the development of achievement motivation and values and their effects on economic growth in Brazil.
Subjects: Preadolescent boys and their parents in several communities in Brazil.
Methods: A projective test will be used to measure certain aspects of personality. Questionnaires, interviews and observation in the field will be employed to obtain data on family structure and socialization.
Publication references and plans: Article in American Sociological Review, October 1962, concerns earlier phase of this study. Plans for future publications depend upon further collection and analysis of data.
Duration: June 1962-May 1965.
Principal investigator: Bernard C. Rosen, Ph.D., Associate Professor, Department of Sociology, University of Nebraska, Lincoln, Nebr.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-W-7 SOCIAL-CULTURAL DIVERGENCE OF LIKE-SEX TWINS

Purpose: Comparison of environmental differences in like-sex twin partners to test validity of the "Twin Method" of research into genetic control of personality and physical traits.
Subjects: 96 pairs of like-sex twins, 6 in each age from 1 year through 16 years--approximately 50 percent fraternal, 50 percent identical, in each age group, and 50 percent female, 50 percent male.
Methods: Depth interviews with each mother, supplemented by direct observation and additional interviews with teachers, fathers, or twins in 20 percent of sample. These empirical data have been coded, scales developed for each variable, i.e., in-group process within twin dyad; parental relationship; differences in peer relations; and differences in activities pursued. Additional data will be presented in tabular form.
Publication plans: Plan to publish in form of monograph.
Duration: November 1960-July 1962.
Principal investigator: Rosemary Kutak (Ph.D. Candidate), Research Sociologist, Child Development Unit, University of Louisville, Louisville, Ky.

16-W-8 INTERRELATIONSHIPS AMONG GUILT AND HONESTY IN VARIOUS ETHNIC GROUPS

Purpose: A previous study (Bulletin 15, Research Relating to Children) demonstrated a highly significant difference between Caucasians and Samoans in both covert and overt honesty. Purpose of present research is to replicate the previous research with a subsample of urban children in Honolulu, and to determine whether or not the covert results can be demonstrated for various other ethnic groups living either in an urban or rural setting.
Subjects: Approximately 300 Orientals, Hawaiians (and/or part-Hawaiians), Samoans, and Caucasians, from three public schools on Oahu, one in Honolulu, the others in outlying areas. Both sexes and various grade levels from 7 through 11 are represented.
Methods: For part of the urban sample (subsample consisting of Orientals, Hawaiians, and Caucasians), overt honesty will be determined in an actual behavioral situation, while covert honesty will be determined via a projective story completion test. For the remaining subjects (of the same ethnic membership as those in the city subsample), only the projective story completion test data (i.e., covert honesty measure) will be obtained. For the city subsample, the association between covert and overt honesty will be determined, as well as whether or not the association differs significantly from previous findings. In addition, it will be determined whether the association differs among ethnic groups. The total real sample will be broken down into subsamples in various predetermined groups, and a multiple regression analysis will be performed on each of the several different story completion scores. Scores will be regressed on school grade, sex, and ethnic group.
Publication plans: Plan to submit to an appropriate psychology journal.
Duration: January 1962-June 1963.
Principal investigators: Robert E. McMichael, Ph.D., Assistant Professor of Psychology, Michigan State University, East Lansing, Mich., and Robert E. Grinder, Ed.M., Assistant Professor of Educational Psychology, University of Wisconsin, Madison, Wis.
Cooperating group: Michigan State University.

16-W-9 SOCIALIZATION AND VALUES IN THE NEGRO AND EAST INDIAN SUBCULTURES OF TRINIDAD

Purpose: (1) To establish differences in socialization and values between Negroes and East Indians; (2) to examine these differences in the light of subcultural development; (3) to show that differences in socialization and values are maintaining the cultural disparity of Negroes and East Indians in Trinidad.

Subjects: Negro and East Indian mothers (50 of each) in maternity wards of hospitals; Negro and East Indian school children (400 of each).
Methods: Depth interviews and objective questionnaires.
Findings: Negor mothers and school children show a significantly greater degree than East Indians of "extent of social reference," "independence training," and "direct action." East Indian mothers and school children show a significantly greater degree than Negroes of "parent-child closeness," "work orientation," "material concern," "internalization," and "prosocial aggression."
Publication plans: Publication in a psychological journal or by a publishing house such as Prentice-Hall.
Duration: June 1960-November 1962.
Principal investigator: Helen B. Green (Ph.D. Candidate, University of Connecticut), Lecturer in Psychology, Wesleyan University, Middletown, Conn.

16-W-10 SOCIALIZATION IN A RURAL AUSTRIAN COMMUNITY

Purpose: To identify particularly those influences which create attitudes favorable for technical development and related forms of culture change. Previous research in this village has revealed extremely favorable attitudes to technical change on the part of the rural population.
Subjects: Children and parents in Altirdning, Steiermark, Austria.
Methods: Observation.
Publication plans: Journal articles.
Duration: June 1962-not reported.
Principal investigators: John J. Honigmann, Ph.D., Professor of Anthropology, University of North Carolina, and Irma Honigmann, B.A., Chapel Hill, N. C.
Cooperating groups: Institute for Research in Social Science, University of North Carolina; American Philosophical Society.

16-W-11 STUDY OF LEISURE-TIME NEEDS AND SERVICES, VALUES, IDEALS, AND ETHICAL BELIEFS OF EDMONTON YOUNG PEOPLE

Purpose: (1) To survey the leisure-time services and facilities available to youth in the Edmonton area; (2) to obtain an appraisal of leisure-time activities by youth themselves; and (3) to explore the values, ideals, and beliefs of Edmonton youth.
Subjects: 86 boys and 70 girls, aged 13 to 20 years, living in the northeast section of Edmonton, Alberta.
Methods: Stratified random sample. Questionnaires, interviews, statistical tabulations.
Publication references: Interim report, *North East Edmonton Young People*, available from investigator.
Duration: Fall 1959-indefinite.
Principal investigator: Gustave A. deCocq, M.S.W., Research Consultant, Council of Community Services of Edmonton and District, 10011-103rd. St., Edmonton, Alta.
Cooperating groups: University of Alberta; North-East Edmonton Community Council.

16-W-12 EDUCATION AND MARGINALITY IN THE COMMUNAL SOCIETY OF THE HUTTERITES

Purpose: To observe methods of socialization in a communal society and to discover the ways in which persons deviate from communal living. Answers are sought to two fundamental questions: (1) under what conditions and by what methods are moral values transmitted to children in a communal society; (2) under what conditions does the collective-oriented personality deviate from the moral teachings in a communal society?
Subjects: The Hutterites originated in Austria in 1529 as a Christian communal group practicing the teaching of "community of goods." Today their colonies are located in the agricultural areas of northwestern United States and Canada. The investigation will be carried out in Alberta, Canada, where about 60 colonies reside.

Methods: Formulation of the original charter or code of values of the Hutterite life. Determination of methods of character education in Hutterite colonies through study of the public schools in these colonies and observations of colony teaching agencies such as the kindergartens. Study of deviancy through interviews with persons who have left the colonies. Inductive type generalizations based upon empirical findings and observations in these colonies.
Duration: June 1962-September 1965.
Principal investigator: John A. Hostetler, Ph.D., Department of Sociology and Anthropology, Pennsylvania State University, University Park, Pa.
Cooperating groups: Pennsylvania State University; Office of Education, U. S. Department of Health, Education, and Welfare.

16-N-13 THE EFFECTS OF SOCIAL INTERVENTION AND GROUP TRAINING ON THE PERFORMANCE OF CHILDREN WHO COME FROM SUBCULTURAL BACKGROUNDS

Purpose: To see if intervention by various social agencies can be used to educate families who are below "average" socio-economically and to see the effects of such intervention upon children's subsequent performance in first three years of school. To see the effect of group training of children on their subsequent performance in school. To evaluate relative influences of social intervention and group training, combined or considered separately.
Subjects: 12 children, C.A. 3-0 to 5-6, selected from subcultural backgrounds, whose current functioning is below their potential because of cultural deprivation, and who are without apparent emotional or organic complications.
Methods: The term "subcultural" to be defined in terms of (1) a social worker's rating of the family's socio-economic status, and (2) a nutritionist's rating of the family's food intake. Child's intellectual and social functioning to be evaluated on various tests. Group training to be defined in terms of the structure and limits set by an occupational therapist and her assistant. Effects of social intervention and group training to be evaluated in terms of child's follow-up performance on the same tests as well as his school grades. During the first year, the experimental group will receive help from the nutritionist and social worker in home and group training. During the second year, these social agencies will continue to give individual help to families and the children will continue to receive group training with more controls being added. During the third year, all special help to the families will be terminated with only the children receiving group training. A matched control group will also be provided. It is hypothesized that children in the first and second year groups will perform better in school than those in the third year group because of the added help given to their families. The value of preschool training for the children in different experimental conditions can be assessed at the end of their third year in school.
Publication plans: Will publish results in psychology, education, and/or mental retardation journals as applicable.
Duration: July 1961-July 1964.
Principal investigators: Sidney I. Dean, Ph.D., Chief Psychologist, and Garret H. Yanagi, Ph.D., Staff Psychologist, Mental Retardation Division, Hawaii State Department of Health, P. O. Box 3378, Honolulu, Hawaii.

16-N-14 STUDY OF EXPERIENTIAL AND ENVIRONMENTAL MENTAL STIMULATION OF LOWER CLASS PRESCHOOL CHILDREN

Purpose: To study mental environment of urban, lower class, preschool children. Study attempts to investigate specific resources of mental stimulation in the homes of families of three economic levels in order to describe more specifically the ties between social and cultural environments and mental growth of children.
Subjects: Three groups of 50 families each--one group chosen from a slum area; one from a more stable working class section; and one from a professional-managerial, upper-middle class residential district.
Methods: Collection of data will proceed via structured interviews, observation of home environments, and standardized stimuli depicting parent-child situations. Information will be collected on: daily activities, physical facilities, televiewing and radio-listening frequency

and content, play resources, literature resources, and out-of-home activities of the child, background, occupation, and education of the parent, their aspirations for the child, and language modes and usage for communication in the home. Quality, variety, and quantity of children's experiences in these homes will be examined. Data will be analyzed for range and level of resources for mental stimulation and growth within each economic group. The three groups will be compared to determine extent of difference between the economic levels. Inferences will be drawn for preschool programs to provide appropriate stimulation for culturally deprived preschool children.
Duration: June 1962-May 1965.
Principal investigators: Robert D. Hess, Ph.D., Chairman, and Mrs. Patti Gregory Kemper, Research Assistant, Committee on Human Development, University of Chicago, Chicago 37, Ill.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-K-15 THE POLITICAL SOCIALIZATION OF ADOLESCENTS

Purpose: To explore the processes, social and psychological, by which the adolescent (1) chooses a political party with which to identify his loyalties; (2) chooses or does not choose to participate in the "political" activities in the high school; and (3) becomes interested in politics, with reference to his wider environment.
Subjects: All students in 10 high schools in Illinois and their parents and teachers.
Methods: The students completed schedules in the fall of 1957, and again in the spring of 1958. Some of them were again contacted in the spring of 1962. Parents and teachers were contacted in the fall of 1957. In addition to the usual survey data, complete sociograms are available for each school at the two points in time.
Findings: The major finding so far deals with the role of the peer group in influencing party choice over and above that of the family which is, of course, the most important single source of political influence. One very surprising finding is the greater influence on political party choice exerted by the mother on adolescents of both sexes.
Publication references and plans: Public Opinion Quarterly 25: 596-606, winter 1961; forthcoming dissertation.
Duration: 1960-1963.
Principal investigator: Martin L. Levin, Ph.D. Candidate, Department of Social Relations, Johns Hopkins University, Baltimore, Md.
Cooperating group: For original collection of data, Office of Education, U. S. Department of Health, Education, and Welfare.

16-K-16 VOCATIONAL DEVELOPMENT IN ADOLESCENCE

Purpose: To measure and determine the correlates of vocational maturity.
Subjects: 5,000 pupils in grades 5-12 in Cedar Rapids, Iowa.
Methods: Data were gathered with a questionnaire called the Vocational Development Inventory and were analyzed by various statistical techniques.
Findings: There are systematic differences in the vocational behavior of younger and older adolescents which indicate that vocational behavior does mature.
Publication plans: Journal articles and a monograph.
Duration: January 1962-December 1964.
Principal investigator: John O. Crites, Ph.D., Assistant Professor of Psychology, State University of Iowa, Iowa City, Iowa.
Cooperating group: Cedar Rapids School System.

16-K-17 UNWED MOTHERHOOD: BACKGROUND AND SOCIAL CONSEQUENCES

Purpose: To study a number of background and situational characteristics of unwed mothers and to investigate some of the personal and social consequences of the pregnancy on her and the

BEST COPY AVAILABLE

child. The following are illustrative of the types of variables to be included: education of subject and her parents, occupation, place of residence, race, marital status of parents, characteristics of the father, feelings of guilt or shame, effect on her educational, occupational, and marital plans, relationships with family and peers, placement of the child, and attitude toward the child.
Methods: Three sources of data will be utilized: case materials from two maternity homes over a span of three to six months prior to the birth; questionnaires from physicians and their unwed patients during pregnancy; survey data from unwed mothers selected from birth registration records.
Duration: 1961-1963.
Principal investigators: Charles E. Bowerman, Ph.D., Professor of Sociology and Research Professor, Donald P. Irish, Ph.D., Research Associate, and Hallowell Pope, M.A., Research Associate, Institute for Research in Social Science, University of North Carolina, Chapel Hill, N. C.
Cooperating group: Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-W-18 A COMPARISON OF THE SOCIAL EXPERIENCE AND DEVELOPMENT OF CHILDREN BORN IN- AND OUT-OF-WEDLOCK

Purpose: To determine whether in a group of homogeneous social class, differences can be found in the development and social experiences of children born in- and out-of-wedlock.
Subjects: 353 Negro infants, born in Kings County Hospital, 1956-1959, with birth weights of 2,100 grams or less and discharged alive. One third were born out-of-wedlock.
Methods: Determination of mother's marital status was made at the time of delivery. Information on social experience was obtained by parental interviews when child was 12 months and 30 months of age. Eight developmental examinations were given to each child in the first three years of life. Appropriate statistical comparisons were made of the social scores and the developmental scores of the children of married and unmarried mothers.
Findings: While all data have not been yet analyzed, it seems probable that it will be found that the social experiences of both groups are analagous and relate to social class rather than to mother's marital status.
Publication plans: To be presented at American Orthopsychiatric Association meeting, 1963.
Duration: October 1956-September 1963.
Principal investigators: Alfred M. Freedman, M.D., Professor and Chairman, Helen Wortis, M.S., Assistant Professor, and Rhoda Cutler, M.S., Assistant Instructor, Department of Psychiatry; Caryl Heimer, M.D., Assistant Professor, Department of Pediatrics; New York Medical College-Flower and Fifth Ave. Hospitals, New York 29, N. Y., and Martin D. S. Braine, Ph.D., Research Associate, Clinical and Social Psychology, Walter Reed Army Medical Center, Washington, D. C.

HEALTH SERVICES AND SURVEYS

16-X-1 EFFECT OF HOME CARE ON A LOW INCOME POPULATION

Purpose: To determine whether and to what extent provision of medical care for acute physical illnesses through the primary vehicle of home visiting is associated with consequences to the health and welfare of the population served. Particular emphasis is placed on home care in acute illnesses especially among children.
Methods: In a first phase, data are being collected on how families in a large public housing project come into contact with and receive services from the various medical care facilities and health personnel in the community. A random sample is used and open-ended inquiries are made of respondents with the help of an interview guide. Later phases will attempt to isolate behavior and indices associated with home care using more quantitative methods and appropriate comparison groups.
Duration: 1962-not reported.
Principal investigators: Count D. Gibson, Jr., M.D., Professor and Chairman, and Bernard M. Kramer, Ph.D., Assistant Professor, Department of Preventive Medicine, Tufts University School of Medicine, 25 Bennet St., Boston 11, Mass.
Cooperating group: National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-X-2 APPLICATION OF PREVENTIVE CONCEPTS OF MENTAL HEALTH BY A PUBLIC HEALTH NURSE IN MATERNAL-CHILD NURSING

Purpose: Basic assumptions: (1) Pregnancy is a stressful period in a woman's life. The manner in which the mother solves her problems has an important bearing upon future mother-child relationships and the well-being of the entire family. (2) Pregnancy is a period during which the woman is more responsive to emotional support. (3) There is a lack of specific information concerning the knowledge and skills needed by the public health nurse in a mental health capacity in maternal and child nursing services. Purpose of the project is to determine what knowledge and skills are needed by the public health nurse to promote good mental health in mothers and children and to prevent emotional disorders during pregnancy and during the first two years thereafter. The focus of the project is upon: documenting the facts that a public health nurse works with both reality and emotional problems in maternal-child nursing, differentiating the reality problems from the emotional problems, determining which problems the nurse recognizes and those which she fails to recognize, and determining what action the nurse takes in relation to the problems she recognizes.
Duration: January 1962-January 1965.
Principal investigators: Elwyn N. Akers, M.D., Chief, Maternal and Child Health Section, and staff, Colorado State Department of Public Health, 4210 E. 11th Ave., Denver 20, Colo.
Cooperating groups: University of Colorado Medical Center; Grant Foundation.

16-X-3 PRENATAL CARE ATTITUDES AND PRACTICES

Purpose: To probe further into the questions: why many women of low socio-economic status are not more strongly motivated to utilize a neighborhood health service; in what ways these women differ from others of similar background who are highly motivated toward prenatal care.
Subjects: 300 consecutive maternity patients at Philadelphia General Hospital, living in eight census tracts in West Philadelphia, mostly Negro. Of the 300, 66 percent had attended the prenatal clinic at the Hospital; 14 percent had attended a neighborhood clinic; 19 percent attended no clinic.
Methods: Hospital records of all subjects were examined to determine the distribution of mothers with respect to age, parity, residence, and clinic attendance. Structured interviews with 45 mothers were conducted to investigate health attitudes; availability of services ("psychologically" as well as geographically); satisfaction with services; structure of household, occupation and education of mother and of father if he was a member of the household, and length of residence in Philadelphia.

Publication references: Mimeographed report, July 1962, available from Health and Welfare Council, Inc., $1.00.
Duration: 1961-July 1962.
Principal investigator: Dr. Mary W. Herman, Research Associate, Health and Welfare Council, Inc., 1617 Pennsylvania Blvd., Philadelphia 5, Pa.
Cooperating groups: Maternal and Child Health Section, Philadelphia Department of Health; Philadelphia General Hospital; Dolfinger-McMahon Foundation.

16-X-4 PARENTAL AND PATIENT BELIEFS ABOUT RHEUMATIC FEVER AND THE PREVENTION OF RECURRENCES

Purpose: In spite of knowledge and means of preventing recurrences of rheumatic fever, many patients fail to come for prophylaxis regularly. This study is designed to discover whether this is related to the families' understanding about the nature of rheumatic fever and its prevention.
Subjects: Children, adolescents, and young adults attending the Rheumatic Fever Clinic at University Hospitals in Cleveland, and their parents.
Methods: Interviews with parents and patients to find out background and beliefs. Review of hospital records. Study of attendance records.
Findings: Preliminary: poor understanding of what rheumatic fever is and what prophylactic bicillin does. Great concern about the heart. Tendency of parents to overcontrol and over-restrict children under 12 years of age. Attendance up to 12 years, fair; after 12 years, poor.
Publication plans: In pediatric or psychiatric journals.
Duration: July 1962-1964.
Principal investigator: John H. Kennell, M.D., Associate Professor of Pediatrics, Western Reserve University School of Medicine, 2109 Adelbert Rd., Cleveland 6, Ohio.
Cooperating group: Cleveland Area Heart Society.

16-X-5 THE ROLE OF THE PHYSICIAN IN MAJOR CHILDHOOD ILLNESS: A PILOT STUDY

Purpose: To investigate physicians' attitudes and reported practices in communication with parents when they diagnose a fatal or long-term illness in a child. This investigation is a preliminary phase of a planned study of physician-parent interactions occasioned by fatal and long-term childhood illnesses.
Subjects: Pediatricians and family physicians.
Methods: The major method currently planned consists of a depth interview focused around several example situations which a physician might encounter in his practice. The interview is designed to elicit responses concerning the way the diagnostic scene would be approached by the physician and the estimated contacts he might have with parents in regard to informing them concerning the nature of the illness, and giving them advice and emotional support.
Publication plans: Will be submitted for publication when completed.
Duration: August 1962-July 1963.
Principal investigator: Norman B. Gordon, Ph.D., Associate Professor of Psychology, Graduate School of Education, Yeshiva University, 110 W. 57th St., New York 19, N. Y.
Cooperating groups: Albert Einstein College of Medicine, Yeshiva University; Public Health Service, U. S. Department of Health, Education, and Welfare.

16-X-6 PLEOPTIC-ORTHOPTIC HOSPITAL UNIT

Purpose: A Pleoptic-Orthoptic Hospital Unit is proposed to offer the most recently acquired techniques of treatment of amblyopia and strabismus to patients of all income groups and all geographical areas. A randomized clinical study will be carried out to evaluate statistically the effectiveness of such treatment. A comparison of results obtained will aid physicians and hospital administrators in the future to plan adequate facilities in their communities for the best treatment of these common handicaps.

Subjects: Children, age 5 to 18 years.
Methods: Pleoptic treatment after Professors Bangerter and Cupper; orthoptic treatment.
Duration: November 1962-November 1968.
Principal investigators: Mary C. Fletcher, M.D., Assistant Professor of Ophthalmology and Pediatrics, and Louis J. Girard, M.D., Head, Division of Ophthalmology, Baylor University College of Medicine, 1200 M. D. Anderson Blvd., Houston 25, Tex.
Cooperating group: Methodist Hospital (Houston).

16-X-7 PSYCHOLOGICAL AND PSYCHIATRIC EVALUATION IN BURNS

Purpose: To evaluate short- and long-term response of the burned child as it relates to immediate care and long-term rehabilitation.
Subjects: Approximately 50-60 severely burned children treated yearly.
Methods: Tests and evaluation by psychologist, psychiatrist, and clinical staff.
Publication references: Army reports of Dr. T. G. Blocker.
Duration: 1960-1970.
Principal investigators: Stephen R. Lewis, M.D., Associate Professor of Surgery and Chief, Division of Plastic Surgery, and Harold A. Goolishian, Ph.D., Associate Professor and Chief, Division of Psychology, University of Texas Medical Branch, Galveston, Tex.

16-X-8 SPECIAL PROJECT WITH EPILEPTICS

Purpose: A study project to provide for the medical, vocational, and social rehabilitation needs of young inmates with epilepsy and related neurological disorders. It is anticipated that the project will demonstrate how these inmates may be treated in the institutional setting in preparation for their eventual return to the community.
Subjects: 30 young inmate patients, 16 to 25 years of age, drawn from the Department of Correction Reception Center at Elmira and from other State correctional institutions, housed in a special facility and replaced as they are paroled or otherwise released.
Duration: December 1960-1965.
Principal investigators: Hyman Pleasure, M.D., R. Beecher, R. A. Dansereau, and staff, New York Vocational Institution, West Coxsackie, N. Y. (Reported in *Current Projects in the Prevention, Control and Treatment of Crime and Delinquency*, 1962.)
Cooperating group: New York State Department of Correction.

16-X-9 COMPREHENSIVE CARE OF CHILDREN WITH MULTIPLE HANDICAPS

Purpose: A research inquiry into: (1) the existing status of medical, paramedical, and community facilities for children with single and multiple handicaps; (2) development of techniques for optimum outpatient use of these facilities for rehabilitation of the handicapped child; (3) development of standards and guides for an integrated pattern of care; and (4) development of realistic goals for the treatment and rehabilitation of the handicapped child.
Subjects: Children with one or more handicapping conditions. A pilot project limited to children with visual, auditory, and speech defects has begun. Inclusion of children with other handicapping conditions is planned for the future.
Methods: Each patient is examined by the pediatrician and other appropriate specialists. Baseline audiograms, refractions, psychological testing, and laboratory studies are performed on each patient; other studies are performed as indicated. The patients are discussed individually at a team conference to plan further work-up and care. Long-term follow-up of each case is planned.
Publication plans: A final report will be submitted to the Health Research Council of New York City. These results will probably be published.
Duration: January 1962-December 1966.

Principal investigators: Horace L. Hodes, M.D., Director, Department of Pediatrics and Robert S. Siffert, M.D., Director, Department of Orthopedics, Mount Sinai Hospital, New York 29, N. Y. (Reported by Malcolm H. Moss, M.D., Director, Pediatric Comprehensive Care Clinic, Mount Sinai Hospital.)
Cooperating group: Health Research Council of New York City.

16-X-10 ALAMEDA COUNTY MENTAL HEALTH STUDY

Purpose: To ascertain unmet service needs and resources for the care of mentally ill, mentally retarded, and alcoholic persons in Alameda County; to obtain a treatment census of persons over and under 18 years under care during a given period at psychiatric resources in the community and of private practitioners in mental health fields; to make estimates of prevalence in the fields of study; to learn about barriers to utilization of existing services and guidelines for planning essential services and more effective utilization of services.
Subjects: Children, adolescents, and adults in the populations at risk. Professional personnel in mental health fields and their deployment in the county under study.
Methods: Analysis of existing demographic data; collection and analysis of service statistics; interviews with staff members in psychiatric resources and in nonpsychiatric community resources which serve the populations at risk or make referrals; self-surveys of school programs for mentally retarded and emotionally disturbed children, including data on special schools, special classes, testing, counseling, and guidance services; information from public welfare departments, public health departments, and community mental health programs. Mailed questionnaires to psychiatrists, nonpsychiatric physicians, psychologists, and social workers.
Publication plans: A report will probably be released by sponsoring agencies--Alameda County Mental Health Association and Council on Social Planning--in June 1963, with recommendations by the Study Commission. Articles will be submitted to medical, public health, and mental health journals.
Duration: May 1962-June 1963.
Principal investigator: Irving Babow, Ph.D., Study Director, Alameda County Mental Health Study, 7337 13th St., Oakland 12, Calif., and Lecturer, University of California School of Social Welfare, Berkeley, Calif.
Cooperating groups: National Mental Health Act funds made available through California State Department of Mental Hygiene.

16-X-11 PRINCIPLES AND PROBLEMS IN THE APPLICATION OF FAMILY PSYCHOTHERAPY IN A CHILD GUIDANCE CLINIC

Purpose: To delineate clinical and theoretical problems in the application of family psychotherapy in a child guidance clinic.
Subjects: Families attending a psychiatric clinic in the setting of a general children's hospital.
Methods: Descriptive at first; other methods not yet worked out.
Publication references: Preliminary paper presented to Psychiatric Social Work Section of National Association of Social Workers, Northern California Branch, October 1962.
Duration: January 1962-1965.
Principal investigator: Kent A. Zimmerman, M.D., Director, Child Guidance Services, Children's Hospital of the East Bay, Oakland 9, Calif.

16-X-12 EVALUATION OF THE EFFECTS ON CHILDREN OF DELIBERATE INHALATION OF FUMES OF PLASTIC CEMENT

Purpose: (1) To evaluate possible toxic organic effects of "glue-sniffing"; and (2) to evaluate social and emotional factors related to this practice.
Subjects: Children known to be involved in the practice of glue-sniffing.

Methods: Glue-sniffers are subjected to physical examination, laboratory procedures, psychological testing, psychiatric evaluation, and social work interviews with parents.

Publication references: *Journal of the American Medical Association* 181: 300, July 28, 1962.

Duration: November 1961-July 1963.

Principal investigators: O. N. Massengale, M.D., Instructor in Pediatrics, and Helen H. Glaser, M.D., Assistant Professor of Pediatrics, University of Colorado Medical Center, 4200 E. Ninth Ave., Denver, Colo.

Cooperating groups: Denver Juvenile Hall; Division of Maternal and Child Health, Colorado State Department of Health (utilizing funds made available by the Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare).

SOCIAL SERVICES AND SURVEYS

16-Y-1 ATTITUDES OF WHITE ADULTS TOWARD THE ADOPTION OF CHILDREN

Purpose: It is proposed that an earlier study "Attitudes of Negro Adults Toward the Adoption of Children" (Bulletin 12, Research Relating to Children), be extended to include white respondents.
Subjects: About 400 white respondents who are partners in intact marriages in which each partner is between the ages of 25 and 50, where there is either no child or only one child over the age of five, living in areas which are suburbs of Washington, D. C.
Methods: Respondents interviewed in their homes. An interview guide will be utilized in gathering the following data: perceptions of children available for and persons interested in adoption, knowledge of adoptive parents and of their experiences, knowledge of adoption agencies, their requirements, practices and procedures, and assessments of agency operations, responses of those interviewed to the idea of their adopting a child as a means of enlarging their own families, characteristics of a child they would be interested in adopting, etc. Analysis would consist not only of systematic internal comparison of cases drawn from this study but also of comparisons of data from white respondents with data already collected from Negro respondents.
Duration: June 1962-May 1963.
Principal investigator: Leila Calhoun Deasy, Ph.D., Associate Professor and Director of Research, National Catholic School of Social Service, Catholic University of America, Washington, D. C.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-2 STUDY OF ADOPTED CHILDREN

Purpose: To determine whether there are any central identifiable characteristics of adopted children who are referred to a child guidance clinic.
Subjects: Cases selected from clinic files.
Methods: Investigation of possible characteristic differences in the case histories of these adopted children, formulation of categories from these initial hunches which could later be quantified.
Publication plans: Nothing definite; often, material at this clinic is mimeographed.
Duration: Spring 1962-indefinite.
Principal investigators: Vita Krall, Ph.D., Staff Psychologist, Jerome J. Schiller, Ph.D., Chief Psychologist, and Elwyn Smolen, M.D., Director, Child Guidance Clinic of Greater Bridgeport, Inc., 1081 Iranistan Ave., Bridgeport, Conn.

16-Y-3 EMOTIONAL PROBLEMS IN ADOPTED CHILDREN

Purpose: Comparison of adopted children having emotional problems with: (1) nonadopted, emotionally disturbed children; and (2) adopted, nonemotionally disturbed children.
Subjects: Patients in Los Angeles psychiatric settings and volunteers from adoption agencies.
Methods: Questionnaires, group intelligence tests, medical and psychological diagnosis, and case history data.
Findings: Higher percentage of adoptees with emotional disturbances than expected from general population. Adoptees demonstrated more aggressive acting-out and sexual acting-out, less enuresis, more alcoholism, and more suicide attempts. Age at placement, type and length of original adoptive placement do not appear significant.
Publication plans: American Journal of Orthopsychiatry.
Duration: January 1961-January 1963.
Principal investigators: Marshall D. Schechter, M.D., Paul V. Carlson, Ph.D., Instructor in Medical Psychology, James Q. Simmons, M.D., and Henry H. Work, M.D., Head, Division of Child Psychiatry, Neuropsychiatric Institute, University of California, Los Angeles 24, Calif.
Cooperating groups: University of California; adoption agencies; private physicians.

16-Y-4 FOLLOW-UP STUDY ON PARENTS WHO ADOPTED OLDER CHILDREN

Purpose: To determine the problems and satisfactions resulting from the acceptance, for adoption, of white, normal children five years of age and older at the time of placement.
Subjects: 100-120 adoptive couples.
Methods: Data on the stress and satisfaction resulting from such adoptions will be obtained through direct interviews with the parents, a review of the records and the use of a Q-sort completed by the parents.
Duration: June 1962-May 1964.
Principal investigator: Alfred Kadushin, Ph.D., Professor of Social Work, University of Wisconsin, Madison, Wis.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-5 THE STUDY OF ADOPTIONS OF GREEK CHILDREN BY AMERICAN FOSTER PARENTS

Purpose: To study the outcome of approximately 500 proxy adoptions of Greek children into American foster homes, in order: (1) to determine the children's present emotional and physical conditions; (2) to evaluate the adoptive home life and care which they have received, and (3) to arrive at general and theoretical conclusions, useful to agencies dealing with adoptions.
Methods: Researcher will familiarize himself with existing records of the Greek-American adoptions, survey the relevant literature on American adoption theory and practice, consult with personnel of the Children's Bureau who are concerned with adoption, interview a number of foster parents of Greek children in order to explore the range of data, the foster parents' reactions to being interviewed, and to develop systematic interviewing techniques and schedules suitable to the larger research.
Duration: July 1962-June 1963.
Principal investigators: Vera Rubin, Ph.D., Director, Research Institute for the Study of Man, 162 E. 78th St.; John Andromedas, Ph.D. Candidate, Lambros Comitas, Instructor in Anthropology, and Conrad M. Arensberg, Ph.D., Professor of Anthropology, Columbia University; New York, N. Y.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-6 INSTITUTIONAL PHILOSOPHY, PRACTICE, AND STRUCTURE CONDUCIVE TO RESTORATION OF FAMILY LIVING FOR THE CHILD

Purpose: To examine quantitative and qualitative data concerning the relationship between organizational philosophy, practice, and structure of approximately twenty children's institutions in the Southeast and the success of these institutions in obtaining restored family living for the children included in their caseloads. "Restored family life" may include return to a rehabilitated family, placement with hitherto unavailable relatives, adoption arrived at with the parent's active participation, or the strengthening of the child's ties with his family while he remains in group care.
Subjects: Majority of the institutions will be members of the Group Child Care Project of the University of North Carolina, a number of which have accepted restoration of each child to family living as an organizational goal.
Duration: June 1962-May 1963.
Principal investigators: Alan Keith-Lucas, Ph.D., Research Professor of Social Work, and Hansel H. Hollingsworth, M.S.S.W., Lecturer in Social Work, Institute for Research in Social Science, University of North Carolina, Chapel Hill, N. C.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-7 FOSTER PARENT ATTITUDES RELATED TO PLACEMENT SUCCESS

Purpose: No greater challenge faces the child welfare worker than the placement and maintenance of a child in a foster home. Difficulties in placement and frequencies of placement failure are greatly compounded in the case of the emotionally disturbed child. Present research was motivated and formulated in the context of a foster home program associated with a residential treatment center for children. Fruitful preliminary work, conducted in this setting with a small number of subjects, which concerned relations between foster parent attitudes and the success of placement served as the basis of the hypotheses presently being tested with a larger population. A questionnaire is being developed which obtains basic personal data, as well as projective content. It is the long-term objective of this study to further develop questionnaire method as a means of obtaining public opinion concerning foster home placement, as well as facilitating the service functions of recruiting and selecting foster parents, matching them with appropriate children, and identifying areas of potential conflict in need of preplacement casework. While striving toward these goals, a considerable amount of significant data is being accumulated which relates to specific parental needs and the success and failure of placement.
Duration: 1962-1964.
Principal investigators: Ralph W. Colvin, Ph.D., Director of Research and Psychological Services, and staff, Astor Home for Children, Rhinebeck, N. Y.; Anne M. Ritter, Ph.D., Director of Psychological Services, and staff, Kennedy Child Study Center, 149 E. 67th St., New York 21, N. Y.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-Y-8 SELECTION OF FOSTER PARENTS FOR DISTURBED CHILDREN

Purpose: To develop measures that will differentiate "successful" from "unsuccessful" foster home environments in terms of ability to handle the 6 to 11 year old disturbed foster child. The potential discriminative items are expected to be found in some aspects and characteristics of the general social and interpersonal attitudes, family structure and occupational orientation of the foster family.
Subjects: Examples of groups from which the criteria are intended to be derived are: (1) homes from which a child has been removed because of the foster parents' inability to cope with the behavior of the child; (2) a highly agency-selected and self-selected group of foster parents who are attending, or have attended, an intensive group education program on foster child care, etc.
Methods: Social worker ratings of foster homes and a pool of potential predictor items derived from a number of existing social attitude and personality scales. The social worker ratings of foster homes will be factor analyzed and factor scored. Discriminative items will be selected on the basis of significant differences among the known groups and factor scores derived from the analysis of the social worker ratings of foster homes.
Duration: June 1962-May 1964.
Principal investigators: Thomas J. Banta, Ph.D., Assistant Professor of Psychology, University of Wisconsin, and Wilbur J. Schmidt, Director, Wisconsin State Department of Public Welfare, 275 State Office Bldg., Madison, Wis.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-9 DEMONSTRATION PROJECT ON THE TRAINING OF NONPROFESSIONAL PERSONS FOR LICENSING DAY CARE AND INDEPENDENT FOSTER HOMES

Purpose: To study how effectively a nonprofessional person can be trained within a short period of time to license foster day care and independent foster homes for a state agency with responsibility for licensing such homes. A secondary purpose is to demonstrate the usefulness of cooperation in a training program for nonprofessional workers between a division of child welfare in a state agency and a school of social work through a short, carefully structured course.

Methods: Some evaluation is necessitated in the determination of the successfulness of the workers in their agency after the training course is over. Two possibilities of examining this will be used, both based on subjective judgments. The records prepared by the workers after training and their evaluation of the homes for licensing will be compared by the agency supervisor to previous agency records and performance of other workers, and an evaluative instrument for rating the adequacy of the records will be applied by two independent judges.
Duration: June 1962-May 1963.
Principal investigators: Jennette R. Gruener, Ph.D., Professor, and Mrs. Lela B. Costin, M.S.W., Assistant Professor, Jane Addams Graduate School of Social Work, University of Illinois, Urbana, Ill.
Cooperating groups: Department of Children's Services, Illinois State Department of Mental Health; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-10 THE OUTCOMES OF DAY CARE

Purpose: A two-year project to examine the effect of a social factor--day care--by reliably establishing the relationship between day care and its outcomes. To establish the relationship between type, quality and use-time of day care, and (1) physical, (2) social, (3) psychological adjustment of child and family. Expected results: (1) theoretic findings on the nature and direction of the central relationship; (2) a practice- and policy-oriented evaluation of such issues as adequacy of day care, critical episodes in day care, success of placement, and placement factors and critical separation situations.
Subjects: An estimated 400 children and their families using day care, matched by 400 other children and their families not using day care. Sample controlled by maturation level of child, type and quality of day care, demographic and socio-economic factors.
Methods: Children and their families are empaneled according to control factors for day care. Control group is frequency-matched. Assignment to study panel follows diagnostic work-up by physicians, social workers and related professionals. Criterion measurement is followed by three "after" measurements. Statistical analysis of cross-sectional data and longitudinal analysis of data on children in day care.
Duration: June 1962-May 1963.
Principal investigator: Genevieve W. Carter, Ph.D., Associate Executive Director, Welfare Planning Council, Los Angeles Region, 733 1/2 S. Hope St., Los Angeles 17, Calif.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-11 A FAMILY-CENTERED TREATMENT RESEARCH AND DEMONSTRATION PROJECT WITH DEPENDENT MULTIPROBLEM FAMILIES IN PUERTO RICO

Purpose: To develop techniques for family-centered social work treatment of dependent multiproblem families in Puerto Rico. To ascertain the effects of severe emotional, social and physical long-term disabilities among the members of these dependent multiproblem families and to determine if these disabilities are related to the dysfunction of the whole family as a household unit. To identify the origin of the specific disabilities in each household and to develop ways to cope with them. To evaluate the changes occurring among the dependent multiproblem families in the experimental and control segments in order to determine whether they may be ascribed to the family-centered social work treatment.
Subjects: From universe of 555 recipients of child welfare services for five or more consecutive years in San Juan, Puerto Rico, random sample of 240 cases will be randomly assigned to four segments of 60 cases each.
Methods: Research phase will be based on an extended control group design with an experimental segment and three control segments in a "before-after" study. The experimental variable will be the family-centered social work treatment. This variable will be introduced to experimental segment and control segment II, with the difference that the subjects of experimental segment will be measured before exposure to the experimental variable but not so with the subjects of control segment II. The exposure to the experimental variable shall last for approximately two years.

BEST COPY AVAILABLE

Duration: 1962-1964.
Principal investigators: Rosa C. Marin, D.S.W., Professor of Social Work Research and Director, Research Unit, and Maria Elisa Díaz Miranda, Professor of Social Work, and staff, University of Puerto Rico, Rio Piedras, P. R.
Cooperating group: Welfare Administration, U. S. Department of Health, Education and Welfare.

16-Y-12 RESEARCH DEMONSTRATION WITH DEPENDENT MULTIPROBLEM FAMILIES

Purpose: The project will provide intensive casework services in a public welfare department within a framework of organized interagency collaboration. It will attempt: to secure improvement in the adequacy of family functioning among a sample of multiproblem families as operationally defined; to measure the changes made using three different sets of predefined measures; to compare the changes made with those made by a control group of families selected from the same population, to whom the special project services will not be offered; and to analyze, within the demonstration group, factors which appear to be associated with a substantial degree of improvement as measured by the project criteria.
Subjects: During the first year, the public assistance caseloads were screened for families which met the project's operational definition of dependent multiproblem family, and from this population the control and experimental group samples were randomly drawn.
Methods: Material from case records and research interviews was systematically prepared for the "before" case summaries to enable eventual measurement of change using the Family Evaluation Schedule and the Movement Scale. Demonstration group cases were then transferred to the intensive casework demonstration unit, which began assuming cases in November 1961. Other instruments, including case logs for recording certain dimensions of the casework, were developed and put into operation.
Duration: June 1961-1964.
Principal investigators: David Wallace, Ph.D., Director, Social Research Service, State Charities Aid Association, 105 E. 22nd St., New York 10, N. Y.; Frederick G. Kelly, M.S.S., Executive Director, Chemung County Council of Community Services, and Kenneth Y. West, Commissioner of Public Welfare, Chemung County, Elmira, N. Y.
Cooperating group: Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-13 NEIGHBORHOOD IMPROVEMENT PROJECT

Purpose: An experimental, demonstration, and research project to attempt the reduction and eventual prevention of family disorganization and its correlates, adult disordered behavior, and juvenile delinquency, in one neighborhood of highest delinquency in the city of New Haven.
Methods: (1) Intensive, reaching-out, family-centered casework treatment to the most disorganized, multiproblem families whose children are "in clear and present danger" due to neglect or social delinquency; (2) total neighborhood treatment by a comprehensive group work and recreational program designed to reach all age groups and geared to the special needs of each group; (3) a coordinating program designed to bring community services more fully to bear on the needs of the population served, to educate that population to a fuller use of resources, to find existing gaps in services, and to help the community fill these gaps; (4) evaluation of changes resulting from the services given; and (5) study aimed at the early identification of multiproblem families with a group of relatively stable families of comparable socio-economic background.
Publication references and plans: *Social Casework* 42:3:124-127, March 1961; *Social Work* 6:4: 50-56, October 1961; *Marriage and Family Living* 24:1:51-56, February 1962; paper presented at American Sociological Association meeting, September 1962; etc. Two monographs, one describing the total project with a report on evaluation research, are planned.
Duration: September 1960-September 1964.
Principal investigators: Jane Krisberg, Director, and Ludwig L. Geismar, Ph.D., Research Director, Council of Social Agencies, 210 Hamilton St., New Haven 11, Conn. (Reported in *Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency*, 1962.)

16-Y-14 SELECTED CHARACTERISTICS OF FAMILY AGENCY CLIENTS WITH MENTAL AND PARENT-CHILD PROBLEMS IN THE TWIN CITIES

Purpose: To identify the extent to which parent-child problems are associated with mental problems in families in the open caseload of the Minneapolis Family and Children's Service and the St. Paul Family Service.
Subjects: 434 active cases of the two agencies where both parents and at least one child under 19 are in the home.
Methods: Questionnaires (one per case) filled out by the caseworker in whose caseload subject cases fall. Analysis through Chi-square and percentage comparisons.
Findings: Parent-child and mental problems tend to be associated with each other to a high degree. Parent-child problem families and families with both problems tend to have more children and more teenagers, older children, and be in a more advanced step of family development than families with mental problems only. All families are similar with reference to socio-economic status.
Publication plans: Mimeographed report.
Duration: December 1961-June 1962.
Principal investigator: Werner W. Boehm, D.L., Professor, School of Social Work, University of Minnesota, Minneapolis 14, Minn.
Cooperating groups: St. Paul Family Service; Minneapolis Family and Children's Service.

16-Y-15 THE PARENT'S CONCEPT OF THE FAMILY IN RELATION TO FAMILY TREATMENT AND ADJUSTMENT

Purpose: To investigate effects of treatment on the family concepts of the parents of clinic families, and their relationship to family adjustment.
Subjects: Three groups of 20 families: a treatment group of families referred to a guidance center having problems with one of their children; a control group of families in the community with a child who is high in adjustment; a control group of community families with a child who is low in adjustment.
Methods: Administration over time of a Family-Concept Q-sort and other related measures at several treatment points. Control group families tested at equivalent times.
Findings: To date, positive findings on the family-concept measures, sharply differentiating between the guidance center group and the high adjustment group.
Publication plans: Journal publication and informal distribution.
Duration: 1961-1965.
Principal investigator: Ferdinand van der Veen, Ph.D., Clinical Psychologist, Dane County Guidance Center, 2059 Atwood Ave., Madison 4, Wis.

16-Y-16 THE ROLE OF THE SOCIAL WORKER IN A CHILD PROTECTIVE AGENCY

Purpose: To study the tasks, role performance, and skills of social workers providing protective services to children who are neglected or abused, and whose parents are unable or unwilling to provide the necessary care and protection for their children.
Subjects: 65 professional caseworkers in 18 district offices covering all parts of the state, employed by Massachusetts Society for the Prevention of Cruelty to Children.
Methods: Study aims to tap the experience of child protective workers so as to provide some systematic understanding of how they spend their time, skills utilized, and how they feel about it. It is proposed to relate these findings to certain personal data gathered from these workers including their social characteristics, background, training, experience, attitudes, aspirations, and professional orientation. Analysis of written reports, administration and analysis of questionnaires, focused interviews, direct observation.
Duration: June 1962-May 1963.
Principal investigators: Robert M. Mulford, M.S.S.W., General Secretary, and Andrew Billingsley, M.A., Research Associate, Massachusetts Society for the Prevention of Cruelty to Children, 43 Mt. Vernon St., Boston 8, Mass.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-17 HOMEMAKER SERVICE DEMONSTRATION PROJECT FOR SERIOUSLY NEGLECTED ADC FAMILIES

Purpose: To teach mothers who are receiving ADC assistance and have been identified as chronic neglect cases by the Los Angeles County Bureau of Public Assistance, the basic principles and techniques of child care and home management through the use of homemakers as teacher, guides and counsellors. Objective is to prevent further family disintegration and child neglect, thus eliminating need for institutional care and court action.
Subjects: Approximately 212 persons in 40 families in the first year.
Methods: Twelve homemakers will provide approximately 15,840 hours of training in the home to this group of prejudged incompetent mothers and their neglected children.
Duration: June 1962-May 1963.
Principal investigators: James H. Campbell, M.A., Executive Director, Homemaker Service of Los Angeles Region, Inc., 340 N. Larchmont Blvd., and Genevieve W. Carter, Ph.D., Associate Director, Welfare Planning Council, Los Angeles Region, 733 1/2 S. Hope St., Los Angeles, Calif.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-18 A STUDY OF THE AID TO DEPENDENT CHILDREN PROGRAM OF MONTGOMERY COUNTY, OHIO

Purpose: (1) To develop a further understanding of the ADC family--the physical conditions under which they live, the caretaker's outlook on life, and the impact of these attitudes on the family's physical environment; and (2) to explore means whereby casework treatment can be made more effective.
Subjects: 400 ADC families selected from the files of the Montgomery County Welfare Department.
Methods: A 65-item coded questionnaire was forwarded to each of the subjects and, when returned, was matched to existing data in the Welfare Department files. Of the 332 questionnaires which were returned, 32 were randomly discarded and the remaining 300 were retained for the final study. Analysis of data using a 104-item schedule was directed toward identification of general characteristics of the typical ADC mother, child, father, stepfather (if any), and family living conditions and resources. Other analyses were directed toward the attitudes, opinions, and community behavior of the subjects. A second stage to explore means for increased casework effectiveness is in progress and results should be available in June 1963.
Duration: March 1961-June 1963.
Publication references: Mimeographed report available from Montgomery County Welfare Department.
Principal investigator: Stanley Hetzler, Ph.D., Project Director, Montgomery County Welfare Department, 23 N. Sears St., Dayton 2, Ohio.
Cooperating groups: Montgomery County Commissioners; Ohio State Department of Public Welfare.

16-Y-19 ADC FAMILY REHABILITATION PROJECT

Purpose: To evaluate the outcomes and effectiveness of a planned program of service directed toward: modifying the impaired functioning of the identified child; forestalling deviant and other maladaptive behavior patterns in the other siblings; and enhancing the functioning of the family as a group.
Subjects: 80 Aid to Dependent Children cases (40 experimental; 40 control) considered "high risk" families (in view of the aggressive behavior patterns noted in an older child). Families are to include two or more children under 10 years of age.
Methods: It is expected that priority will be given to some form of group treatment for both children and adults, but that some periodic individual casework contact with these families will be necessary. In addition, family social casework is planned.
Publication plans: An agency report will be available. Some studies will be reported in appropriate social work and psychological journals at a later date.

Duration: October 1962-October 1967.
Principal investigators: Alice R. McCabe, M.S., Staff Associate for Family and Child Welfare, Leonard S. Kogan, Ph.D., Director of Research, and Lawrence Berkowitz, M.A., Research Associate, Community Service Society of New York, 105 E. 22nd St., New York 10, N. Y.
Cooperating groups: New York City Department of Welfare; New York City Board of Education; Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-20 DEMONSTRATION OF SOCIAL GROUP WORK WITH PARENTS

Purpose: To demonstrate and evaluate the utility of social group work as a method for strengthening family life with the following types of clients: (1) parents who place their children in independent boarding homes, especially lower class working mothers who are part-time parents; (2) foster parents who board children placed by working mothers; and (3) mothers who are receiving grants under the Aid to Dependent Children program. Project will center its attention upon the prevention of emotional disturbance and/or delinquency in children through group treatment of parents--natural and foster parents. Its focus will be upon facilitating the healthy development of children by improving the attitudes and behavior of parents toward their children through the use of group discussion.
Duration: June 1962-May 1965.
Principal investigators: Paul H. Glasser, Ph.D., Assistant Professor, and Robert D. Vinter, Ph.D., Professor, School of Social Work, University of Michigan, Ann Arbor; Roger M. Lind, M.S.W., Director, Children's Division, and Lynn Kellogg, Director, Public Assistance Division, Michigan State Department of Social Welfare, Lansing 4, Mich.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-21 LOWER CLASS YOUTH DEVELOPMENT

Purpose: To investigate effects of the Aid to Dependent Children program on scholastic achievement and juvenile delinquency. Also, to study the personal and ecological factors associated with school failure and delinquency.
Subjects: All children, aged six, seven, or eight in 1950, on ADC in the New Haven Area (N = 328); a control group of same age and social class (N = 56).
Methods: Data were collected from ADC case records, city directories, school records, police records, and census tract statistics. Thirty main variables on each subject are being tabulated, cross-tabulated, and factor-analyzed.
Publication plans: Two papers planned.
Duration: June 1961-spring 1963.
Principal investigators: Erdman B. Palmore, Ph.D., and Philip E. Hammond, Ph.D., Assistant Professors of Sociology, Yale University, New Haven, Conn.
Cooperating group: Ford Foundation.

16-Y-22 FOLLOW-UP STUDY ON IMPACT OF DENIAL OR TERMINATION OF PUBLIC ASSISTANCE ON FAMILIES

Purpose: To describe the impact on needy families with children of the denial of public assistance, or the withdrawal of assistance before a substitute income is available. Purpose of the project is to provide legislators, administrators, and professional workers with knowledge of the operation and effects of current policies and practices with respect to eligibility for public assistance. The description will be made with particular reference to the program goals of (1) assuring a minimum level of health and decency to families who are without an income of their own, and (2) preventing and reducing dependency.
Methods: Project will be an exploratory one to be carried out over a one-year period in Massachusetts and Vermont, and will include cases drawn from the aid to dependent children and general assistance programs. On the basis of the exploratory work and findings of this study, it is hoped to launch a three-year study which will gather on a national basis information on families seeking help who are not given it.

BEST COPY AVAILABLE

Duration: June 1961-October 1963.
Principal investigator: David G. French, Ph.D., Associate Professor, Florence Heller Graduate School for Advanced Studies in Social Welfare, Brandeis University, Waltham 54, Mass.
Cooperating group: Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-23 REDUCING DEPENDENCY IN ANC FAMILIES THROUGH USE OF GROUP TREATMENT

Purpose: To determine the effectiveness of group treatment as a method of social intervention to promote positive changes in the social functioning of mothers and their adolescent children who have been receiving public assistance for a longer than average period.
Subjects: 44 families in the North County Office area, selected according to following criteria: (1) family members include mother and adolescent children living at home, but no father; (2) the last continuous period of aid has been two and one-half years or more; and (3) there is no evidence of active psychosis, acute alcoholism, or drug addiction.
Methods: Population is divided into experimental and contrast groups by random selection using three variables to stratify. The contrast group continues to receive the usual Aid to Needy Children services. Mothers and adolescent children are assigned to treatment groups which meet weekly for 10 months. Focus of treatment is on modification of actions and attitudes which prolong dependency and social dysfunctioning. After six months of peer group treatment, family group sessions are added to the treatment program. Effectiveness is measured by independent judges who use a social functioning profile obtained at beginning and termination of treatment.
Duration: August 1962-January 1964.
Principal investigators: Gloria Ambrosini, M.S.W., A.C.S.W., and Mrs. Louise A. Wilson, A.C.S.W., Caseworkers, Santa Clara County Welfare Department, North County District Office, 270 Grant Ave., Palo Alto, Calif.
Cooperating group: Family Service Association of Palo Alto and Los Altos.

16-Y-24 A DEMONSTRATION AND RESEARCH EVALUATION OF A GROUP WORK PROGRAM FOR ESTABLISHING A MUTUALLY BENEFICIAL RELATION BETWEEN THE YOUNG TEENAGE CHILD AND PARENT IN ONE-PARENT FAMILIES

Purpose: To plan a group work program aimed at maximizing the relations between parent and child in lower class homes broken by separation, divorce, or death. Hypotheses: through a program of guided group interaction, communication between parent and child will be facilitated and the problems of each will be better understood; through meetings with a trained worker, it is anticipated that groups of parents and children, groups of children alone, and groups of parents alone will become sensitized to the needs of both parent and child.
Methods: Weekly meetings will be held at the agency and monthly at a home with mother as a hostess. Techniques for involving the teenager would have to be experimentally derived. It is planned to reach out first to male teenagers and later to include girls. Focus of the weekly group meetings would be on the discussion of problems of the teenager's relation to his family. The efficacy of these interaction programs would be tested and modifications experimented with for use in the later demonstration program.
Duration: June 1962-May 1963.
Principal investigators: Paul K. Weinandy, M.S.A., Executive Director, Huntington Family Centers, 512 Almond St., and Nathan Goldman, Ph.D., Associate Professor of Sociology, Syracuse University, Syracuse, N. Y.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-25 ACTION RESEARCH PROJECT TO DETERMINE EFFECTIVENESS OF INTENSIVE GROUP WORK SERVICE IN CHANGING VALUES AMONG NEGRO BOYS IN FATHERLESS FAMILIES

Purpose: To test effectiveness of intensive social group work in changing certain prevailing

subcultural values as they relate to strengthening motivation and raising levels of aspiration among boys from fatherless families. To measure extent to which the changes affect work habits and school performance as well as the boys' acceptance of the concept and role of an adult male.
Subjects: Negro boys, ages 10 to 13 years, grades four to six, normal I.Q., from fatherless families.
Methods: Experimental group is being given intensive group work service. One control group is receiving normal group work service; another is receiving no service at all. Pre- and post-tests will be given all subjects.
Publication plans: The first year's report will be available early in 1963; publication of findings is planned.
Duration: June 1961-indefinite.
Principal investigators: John W. Cox, M.S.W., Director, and Clarence Barnes, M.S.S., Bell Neighborhood Center, Goodrich Social Settlement, 1839 E. 81st St., Cleveland 3, Ohio.
Cooperating group: Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-26 AN EXPERIMENTAL STUDY OF SERVICES FOR FATHERLESS BOYS

Purpose: To develop a plan for an experimental research program to test or derive hypotheses that will provide answers to the following: (1) Which particular mental, emotional, behavioral, and social problems occur with relatively high frequencies among fatherless boys and their families for whom applications for services are received by the Big Brother agencies, as compared to other boys and families in the community? (2) Which of these problems should be prevented or overcome by Big Brother services, according to the opinions or judgments of responsible persons? (3) What services are currently being provided in Big Brother agencies and what are the conditions, policies and practices involved in their organization and administration? (4) How effective are existing services of Big Brother agencies in preventing or overcoming selected problems? (5) If the effectiveness of services by Big Brother agencies is less than certain acceptable levels, how can their effectiveness be increased to achieve these levels? (6) If the effectiveness of services of Big Brother agencies is at, or can be increased to, acceptable levels, how can the cost be kept within or reduced to certain maximum limits?
Duration: June 1962-May 1966.
Principal investigators: Ephraim H. Royfe, Consultant, and Gerald B. Gersey, Research Associate, Big Brothers of America, 1007 Suburban Station Bldg., and Julius A. Jahn, Ph.D., Professor of Social Research and Director of Research Center, University of Pennsylvania School of Social Work, Philadelphia, Pa.
Cooperating group: National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

16-Y-27 FATHERLESS FAMILIES AND HOUSING: A STUDY IN DEPENDENCY

Purpose: To examine the impact of different types of housing on the life styles, aspirations, cognitions, and behaviors of low income, fatherless families whose source of income is ADC, in contrast to those whose income is derived from current earnings or other sources. In addition, it is proposed to observe the contrasts in life style, etc., among low income families with radically different family structures by comparing fatherless families with "complete" families (those with husband and minor children residing in the household) and elderly individuals and couples.
Methods: Field interviewing for both the longitudinal and cross-sectional segments. Interviewing will cover all phases of the longitudinal sequence as they occur (i.e., moving in through moving out of the public housing project) and to the extent that they occur during this year.
Duration: 1962-1963.
Principal investigators: Irwin Deutscher, Ph.D., Director of Research, and Seymour Bellin, A.M., Research Associate, Youth Development Center, Syracuse University, Syracuse 10, N. Y.
Cooperating group: Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-28 AN EXPERIMENTAL PROJECT IN GROUP TREATMENT WITH POSTNATAL UNMARRIED MOTHERS WHO KEPT THEIR BABIES

Purpose: (1) To learn more about the problems of the unmarried mother who keeps her baby; (2) to determine whether group treatment can contribute to the reduction of acting out of difficulties through the symptom of illegitimate pregnancy; (3) to learn more about structuring groups and selecting group members to provide a meaningful interpersonal experience; (4) to provide an opportunity for catharsis and abreaction of feeling; (5) to help decrease girl's feelings of isolation and to encourage ability to interact with others; and (6) to support individual casework.
Methods: Three-generation social history precedes selection by psychological screening which includes projective techniques. Weekly group meetings with six to eight unmarried mothers consisting of 90-minute discussions on a supportive, cathartic level, over a nine-month period.
Findings: The more homogeneous the group in terms of underlying pathology, the more favorable the group climate is likely to be. Taking of notes by a group recorder seems unrelated to spontaneity in the group. Ability to express hostility verbally seems related to establishment of group cohesiveness. Group participation seems conducive to recognition of problems aside from the immediate problem of the infant's care and financial support. The unmarried mother who keeps her baby does not seem to have a typical personality pattern. Group experiences seem related to a changing perception of defiance as strength.
Duration: October 1961-October 1963.
Principal investigators: Vera L. Lindbeck, M.S.S., Supervisor, Girls' Department, and Lou Ann Reed, B.A., Probation Officer, Hamilton County Juvenile Court, 2020 Auburn Ave., Cincinnati 19, Ohio.

16-Y-29 INTENSIVE POSTPARTUM CASEWORK WITH UNMARRIED MOTHERS

Purpose: To demonstrate the feasibility of intensive social casework with young unmarried mothers in a maternity shelter and with their parents. Subsidiary aims are to make inquiry into treatment techniques with unmarried mothers, the role of male caseworkers in this field, the effectiveness of joint sessions with parents and client, and the development of instruments for evaluation of change in client's problems.
Subjects: Unmarried mothers between the ages of 13 and 19.
Methods: Subjects will be extensively tested and interviewed upon entering the shelter for purposes of establishing a baseline of their attitudes, problems, and potentialities. Mothers will be randomly assigned to an intensive casework group or to an informational control group. The study attempts to measure differences between the adjustment of the two groups to home and family, educational and occupational pursuits, and peer group, and also differences in self-concept and maturity. Casework will begin in the last trimester of pregnancy and extend through the first six months to a year of their readjustment period in the community. Evaluation will be done by a group of outside consultants who will not know which cases have received intensive treatment.
Duration: June 1962-May 1963.
Principal investigators: Daniel J. McSweeney, M.D., Chief of Obstetrics, St. Mary's Infant Asylum and Lying-In Hospital, 90 Cushing Ave., Dorchester, Mass.; John V. Driscoll, Ph.D., Dean, Boston College School of Social Work; George H. Grosser, Ph.D., Research Associate, Department of Psychiatry, and Theodore J. Curley, M.S.W., Social Work Consultant, Division of Legal Medicine, Harvard Medical School; Boston, Mass.
Cooperating group: Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

16-Y-30 UNMARRIED MOTHERS WHO KEEP THE FIRST OUT-OF-WEDLOCK CHILD

Purpose: To examine the experiences during the first crucial year and one-half following the birth of the first out-of-wedlock child.
Subjects: Approximately 300 unwed mothers who do not place their child for adoption.

Methods: Five areas will be covered: (1) completion of education; (2) means of financial support; (3) housing arrangements; (4) arrangements for care of the child; and (5) social adjustment (i.e., whether the unwed mother marries, becomes pregnant out-of-wedlock again, comes into contact with law enforcement agencies, is affiliated with neighborhood groups, etc.). Information will be obtained through a series of interviews with the unwed mothers beginning with a hospital interview at the time of confinement and supplemented by three follow-up interviews at six-month intervals. The investigation will focus upon the unwed mother's experiences in the five specified areas in terms of changes in her situation, problems faced and efforts to cope with them, factors associated with failures to cope with problems, etc.--information that can be used in planning the "package" of community health, welfare, and other services which would have the greatest potential for furthering the rehabilitation of the mother and the welfare of the child.
Publication plans: Interim and final reports to be published by Community Council of Greater New York.
Duration: 1962-1965.
Principal investigator: Mignon Sauber, M.A., Director, Research Department, Community Council of Greater New York, 345 E. 45th St., New York 17, N. Y.
Cooperating group: Social Security Administration, U. S. Department of Health, Education, and Welfare.

16-Y-31 CHILDREN OF WOMEN PRISONERS: RELATIONSHIPS OF A CORRECTIONAL INSTITUTION AND THE SOCIAL AGENCIES WORKING WITH INCARCERATED WOMEN AND THEIR CHILDREN

Purpose: To provide an accurate description of the current situation in California with regard to: number of women in the state prison having minor children and the number of children involved; residential placements of those children as compared to their living situations before the mother's incarceration; extent to which social welfare services are provided to those children in the community, and the patterns of agency usage; social welfare needs of the children not presently receiving services; extent and problems of interagency (including the institution) communication and coordination of services; what could be done differently or additionally to serve the needs of the family as a whole in a more effective and coordinated way.
Subjects: Personnel and inmates of California Institution for Women; children of women inmates; fathers and parental substitutes; community agency personnel.
Methods: Descriptive survey through data collected by file content analysis, questionnaires, and guided interviews.
Publication plans: Research reports of findings of the individual stages of project will be prepared for sponsoring departments. Research reports will be published jointly by California Departments of Social Welfare and Corrections. Articles for professional journals and/or a monograph may be published subject to approval of sponsoring agencies.
Duration: March 1962-August 1963.
Principal investigator: Serapio R. Zalba, M.S.W., California Institution for Women, Frontera, Calif.
Cooperating groups: California Departments of Social Welfare and Corrections.

16-Y-32 YOUTH-WORK PROGRAM REVIEW

Purpose: To assess impact of programs in counseling, placement, and training on problems of unemployed, out-of-school youth in selected urban areas, and to establish standards and guidelines for such programs.
Methods: Field visits and review of published materials using a standard report form. These data can then be utilized to determine which problem groups are being served and to what extent the needs of unemployable youth are being met in a given community--in addition to analysis of program elements.
Publication plans: A series of monographs in summer, 1963.
Duration: July 1962-July 1963.
Principal investigator: Marcia K. Freedman, Ph.D., Director, Youth-Work Program Review, National Committee on Employment of Youth, 419 Park Ave. So., New York 16, N. Y.
Cooperating group: President's Committee on Juvenile Delinquency and Youth Crime.

16-Y-33 EFFECT OF SOCIAL GROUP WORK ON ANTISOCIAL YOUTH

Purpose: (1) To define and describe the social group work processes and professional social work intervention in the resocialization of hostile, acting-out, antisocial teenage boys; (2) to evaluate effectiveness of two methods--limited social group work and total social group work.

Subjects: Boys attending either of two seventh grades in junior high schools, identified through various psychological tests by sixth grade teacher's rating, willingness to participate, permission of parents, and exhibiting capacity to form peer relationships. Treatment groups of nine members will be formed of pairs and trios of youth with pre-existing close relationships.

Methods: Exploratory study leading to a field experiment for testing the two social group work methods. Pretesting in actual settings to be observed. Revisions and procedures will be made prior to final test of the two social group work methods. Final 18-month test period will rigorously adhere to procedures developed. Analysis of data will proceed concurrently with the practice. Analysis of changes that occur in norms and behavior of the treatment group and its members and measurement of both individual and group changes, and assessment of the roles of the group worker in the treatment process will be made. In general, data about the changes in the group will be derived by comparison of descriptive data at different time segments. Data from all sources will be analyzed so that a complete life history can be prepared on each youth with his relationship to the delinquent subculture and his relevant environments. Common elements in the life histories will be further analyzed as to their significance to professional intervention and the formation of treatment group attitudes.

Publication plans: Results will be reported periodically in papers and articles, and in book form at the end of the project.

Duration: October 1962-October 1967.

Principal investigator: Tsuguo Ikeda, M.S.W., Project Director, Seattle Atlantic Street Center, 2103 S. Atlantic St., Seattle 44, Wash.

Cooperating groups: United Good Neighbor Fund; Woman's Division of Christian Service, Board of Missions of the Methodist Church.

RESEARCH NOTES

NEW LOOK, NEW PROCESS FOR *RESEARCH RELATING TO CHILDREN*

The next issue of *Research Relating to Children* will probably be quite different from the one you are now reading. It will be produced using a limited data storage and retrieval system currently being adopted by the Children's Bureau Clearinghouse for Research in Child Life, and will incorporate changes in its format and content to provide more useful research information. The proposed system will initially consist of a machine which produces punched paper tape and has the ability to follow an elementary program of information storage, selection, and reproduction. The tapes will also be used as direct input to an RCA 301 computer for automatic handling of Clearinghouse mailing lists, and ultimately for final production of copy for Clearinghouse publications. It is probable that the conversion of existing records and systems to the new automated process will make it necessary for the Clearinghouse to suspend its publications and services for several months. It is felt that the gains in coverage, speed, and additional services under the new system will amply justify this brief interruption.

STANFORD OPENS RESEARCH INSTITUTE FOR CHILDHOOD APHASIA

The Scottish Rite Institute for Childhood Aphasia opened last fall at the Stanford University Medical Center with initial funds of $22,200 granted by the Scottish Rite Foundation of California. Ten to fifteen neurologically impaired aphasic children of preschool age will be studied and will receive training for periods of one to three years. Goals of the institute include the development of special techniques to teach these children to speak and understand language, and to pinpoint learning problems associated with brain injury. It is also planned to train teachers and speech therapists for work with aphasic children, and to provide counseling and guidance for parents of children who cannot be accepted by the Institute. Institute director is Dr. Jon Eisenson.

IN PLANNING -- NATIONAL CLEARINGHOUSE ON MENTAL HEALTH INFORMATION

The National Institute of Mental Health will shortly open its new National Clearinghouse on Mental Health Information in Bethesda, Md. The Clearinghouse will have as its function the collection, storage, abstracting, indexing, retrieving, and dissemination of all information relevant to mental health, both quantitative and qualitative in content. Coordinating and liaison relationships with professional and voluntary organizations will be emphasized. Through evaluation and synthesis of information, the Clearinghouse will serve as a major technical resource for the Institute's program analysis, program evaluation, and program planning activities. Personnel include Dr. Joseph H. Douglass, Chief, and Dr. Lorraine Bouthilet, Assistant Chief.

EDUCATIONAL PSYCHOLOGY JOURNAL ANNOUNCED BY OHIO STATE UNIVERSITY

The Division of Special Education of the Ohio State University's Department of Education has announced the publication of a new journal, the *Journal of School Psychology*. Its purpose is to provide an outlet for research studies and articles in professional school psychology, and will serve primarily as an organ for publication by school psychologists and school psychology trainees in the State of Ohio. It will be published semiannually, with the first issue planned for January 1963. For information concerning submission of manuscripts, write to: Donald C. Smith, Editor, *Journal of School Psychology*, Department of Psychology, Ohio State University, Columbus 10, Ohio.

OTHER ABSTRACTING JOURNALS AND SERVICES

Child Development Abstracts and Bibliography, Child Development Publications, Society for Research in Child Development, Inc., Purdue University, Lafayette, Ind.

Digest of Neurology and Psychiatry, Institute of Living, Hartford, Conn.

Dissertation Abstracts, University Microfilms, Ann Arbor, Mich. (Gives synopses of U. S. doctoral dissertations with an annual index.)

dsh abstracts, Deafness, Speech and Hearing Publications, Gallaudet College, Washington 2, D. C.

Excerpta Criminologica, New York Academy of Medicine Bldg., 2 E. 103rd St., New York 29, N. Y.

Inventory of Social and Economic Research in Health, Health Information Foundation, 420 Lexington Ave., New York 17, N. Y.

Listing of Health and Welfare Research Projects in Local Communities, United Community Funds and Councils of America, Inc., 345 E. 46th St., New York 17, N. Y.

Nutrition Abstracts and Reviews, Rowett Research Institute, Bucksburn, Aberdeenshire, Scotland.

Psychological Abstracts, American Psychological Association, 1333 - 16th St., N. W., Washington 6, D. C.

Rehabilitation Literature, National Society for Crippled Children and Adults, 2023 W. Ogden Ave., Chicago 12, Ill.

Research and Study Projects Reported by FSAA Member Agencies, Family Service Association of America, 215 Park Ave. South, New York 3, N. Y.

Sociological Abstracts, Leo P. Chall, 225 W. 86th St., New York 24, N. Y.

Sources of Morbidity Data, Clearinghouse on Current Morbidity Statistics Projects, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington 25, D. C.

The Excerpta Medica Foundation, New York Academy of Medicine Bldg., 2 E. 103rd St., New York 29, N. Y., has established an abstracting service on pediatrics on a yearly subscription basis. In addition to abstracts, Excerpta Medica can provide to subscribers, at cost, photocopies and translations of complete articles.

Human Relations Area Files have classified cultural data on primitive and non-primitive societies into 888 categories of human behavior. Complete sets of all files are available in 16 member universities in the United States. For information, write to Dr. Clellan S. Ford, President, Human Relations Area Files, Yale University, New Haven, Conn.

Science Information Exchange, Smithsonian Institution, 313 Universal Bldg, Connecticut and Florida Aves., N. W., Washington 6, D. C., provides to qualified investigators on request selected abstracts of current research supported by foundation or government grants. The Exchange covers such fields as medicine, nursing, public health, nutrition, psychology, education, anthropology, mental health, and intercultural relations.

World Federation for Mental Health, 19 Manchester St., London W.1, England, operates a clearinghouse for research and study projects in the field of mental health.

In addition to these journals and services, many professional journals in such fields as pediatrics and mental deficiency include a section of abstracts regularly or once a year. There are also a number of indexes and abstracting journals in the medical area which occasionally refer to materials in the area of child development.

ACCORDING TO THE CRITERIA ESTABLISHED BY THE CLEARINGHOUSE, THE FOLLOWING TYPES OF STUDIES ARE NOT ELIGIBLE FOR INCLUSION IN RESEARCH RELATING TO CHILDREN

Studies already reported to the Clearinghouse

Studies already published or which will be published before the next issue of Research Relating to Children

Studies completed more than two years ago

Masters' theses, unless they represent work beyond a doctorate, as in dentistry

Annual or biennial reports or other regularly collected information

Handbooks, manuals, directories, textbooks, etc.

Historical or descriptive studies; studies based on secondary sources; bibliographical materials

Studies of test development, standardization, or validation, except tests for special groups of children such as blind or retarded

Studies of local or temporary significance; those of interest primarily to the agency involved

Studies of services or programs not primarily related to children

Studies of general population in which children comprise only an incidental part

Demonstration projects where no formal plan for evaluation is described

Studies of college students or adults where the focus is not on their childhood; studies of parents where the emphasis is not on their children

Educational studies of curriculum construction or materials; teaching methods; general school personnel studies where children are not directly affected; survey of school facilities or needs; general school administration studies

Studies of the training, personality, or aptitude of personnel without measurement of the effects on children

Medical, dental, or nutrition studies limited to: morphology or physiology; the physical aspects of etiology, epidemiology or symptomatology of diseases or handicapping conditions; surgery, chemotherapy, antibiotics or physical therapy, etc. (According to 1956 revision of criteria for inclusion.)

Biochemical or other laboratory studies

FOREWORD

This Bulletin like previous issues, includes reports of research in progress or research very recently completed. It does not report again studies included in Bulletin 3 through 16 even though they are still continuing. This issue, therefore, does not reflect all research relating to children in a given period but only that which was first reported to the Clearinghouse February 1, 1963 through February 29, 1964.

The Clearinghouse has only such information about the research projects as the abstracts provide. Publication references and plans are given for some of the projects, but the Clearinghouse cannot attempt to keep track of the final publication of the studies. The reader who wishes to obtain further information about any of the projects reported should write directly to the investigator or check professional journals in the appropriate field.

For the Clearinghouse, I wish to thank those who have submitted reports and to acknowledge the valuable assistance of the National Council on Crime and Delinquency, the Clearinghouse on Morbidity Statistics Projects of the U. S. Public Health Service, and the several foundations which provide us with information about recent research grants.

To Research Investigators:

This publication is only as complete as you are willing to make it. Page 121 is a form for letting us know of other investigators who are working in the field. Page 123 is a form for reporting your own current research. Please let us hear from you.

Clearinghouse for Research in Child Life

LONG TERM RESEARCH

Note: The reports in this section concern research programs which are more or less continuous.

17-A-1 GROWTH, DEVELOPMENT, AND ADAPTATION OF HUMAN INDIVIDUALS

Purpose: To gain greater understanding of many factors involved, prenatal and postnatal, as an individual is in the process of becoming the kind of a person he is as an adult.
Subjects: Approximately 100 middle class families in Denver, Colorado, including 210 offspring of whom over 50 are second generation followed in the institute. (80 percent of subjects entered since 1930 are still being followed.)
Methods: Each subject followed from birth at regular intervals studying: (1) pattern of changing structure by direct measurements, X-rays, and photographs; (2) development of personality traits, starting with family during prenatal period and carried on intensively with infant, child, and adult; (3) patterns of physiological development including nutrition, biochemical and physiological tests, and evaluation of healthiness.
Duration: 1927-continuing.
Investigator(s): Robert W. McCammon, M.D., Director, Child Research Council, University of Colorado, 4200 E. Ninth Ave., Denver 20, Colo.
Cooperating group(s): University of Colorado; Commonwealth Fund; McDonald Foundation; Nutrition Foundation; National Live Stock and Meat Board; Gerber Company; Lawrence Phipps Foundation; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Appropriate medical or scientific journals every year. Publication lists available.

17-A-2 **ANALYSIS AND EVALUATION OF DATA FROM THE LONGITUDINAL STUDY OF CHILD HEALTH AND DEVELOPMENT BASED UPON MULTIDISCIPLINE AND PERIODIC OBSERVATIONS OF INDIVIDUAL CHILDREN FROM BIRTH TO 18 YEARS**

Initiation date: 1930.
Investigator(s): Research has been discontinued but the analyses of data and preparation of reports are being continued by individuals under the direction of Robert B. Reed, Ph.D., Professor of Biostatistics, Harvard School of Public Health, 55 Shattuck St., Boston 15, Mass.

17-A-3 LONGITUDINAL STUDY OF CHILD GROWTH AND DEVELOPMENT

Purpose: Program consists of study of adult personality, adjustment and aging processes of individuals whose health, growth, personality development, and environment have been studied since birth. It included a study of the aging processes of their parents in relation to physical and biochemical measures made earlier. It will include studies of: parental child-rearing attitudes and practices of two generations in the same families; constancy of autonomic response patterns to stress from childhood to young adulthood and their relationship to psychosomatic disorders in adulthood; blood lipids in relationship to body composition and change in composition.
Investigator(s): Lester W. Sontag, M.D., Director, Fels Research Institute for the Study of Human Development, Antioch College, Yellow Springs, Ohio.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

17-A-4 LONGITUDINAL CROSS-CULTURAL STUDY OF HUMAN DEVELOPMENT

Purpose: To observe the long term effects of environment upon growth and health, that is, the influence of environmental factors upon physical and mental development, and the elucidation of their mode of action and interaction with genetic endowment.
Subjects: Several hundred males followed from prepuberty, all with four grandparents from the same limited geographical zone of southern Italy but now living in the markedly different cultures of Boston, Rome, and Palermo; other groups of 100 girls and several hundred boys in Florence, Italy and 200 girls in Boston.
Methods: Repeated medical, anthropometric and psychological examinations together with family interviews (with evaluation of child-rearing practices), nutrition, and socio-cultural data.
Findings: Reported in numerous articles in American and European journals. Current work under analysis includes cross-cultural study of moral values, studies of biological age and its estimation, estimation of socio-economic status across cultures, blood groups and temperament, and changing hemoglobin values in adolescent males. Work involving further and continuing data collection includes prediction of growth variables, cross-cultural study of creativity and its environmental determinants, a study of left handed subjects in the relatively "permissive" and "intolerant" cultures of the United States and Italy, and an analysis of menstrual symptoms in both cultures.
Duration: 1956-1968.
Investigator(s): Harben Boutourline Young, M.D., Assistant Professor of Physiology, Harvard School of Public Health, Boston 15, Mass.
Cooperating group(s): Grant Foundation; Wenner Gren Foundation; Olivetti Corporation; Universities of Florence, Rome, and Palermo.
Publication: Numerous journal articles; one book is planned, another possible.

17-A-5 THE BERKELEY (CALIFORNIA) GROWTH STUDY

Purpose: A study of the mental and physical growth of approximately 50 normally healthy persons from birth in 1928-29 to the present (35 years).
Subjects: Full term, healthy newborns, born in Berkeley, California hospitals of white, English-speaking parents, if parents were interested--a somewhat selected above average group. 100 offspring of these subjects, age range from a few months to about 16 years, seen irregularly, but the same data (appropriate for age) are collected that were collected for their parents.
Methods: Tests of mental and motor development; pediatric examination; interviews at frequent intervals during growth beginning in first week of life. At all visits, inquiries made concerning current health and recent illnesses. Anthropometrics, body photographs and skeletal X-rays taken at most ages. Socio-economic data available. Comparisons now being made on variety of collected data. Studies of physical aspects of children's growth include analyses comparing health histories with physical growth and with skeletal maturation. Some parent-child relations in susceptibility to illness could be studied. Emotional and other personality variables studied for consistency, and in various interrelations with maternal behavior in infancy, birth histories, socio-economic status, intellectual and physical growth.
Duration: 1928-continuing.
Investigator(s): Nancy Bayley, Ph.D., and Dorothy H. Eichorn, Ph.D., Associate Research Psychologist, Institute of Human Development, University of California, Berkeley 4, Calif.
Cooperating group(s): Institute of Human Development, University of California.
Publication: *Studies in the Development of Young Children*, University of California Press, 1940. *Growth Diagnosis*, University of Chicago Press, 1959. *Child Development* 12:167-173, 1941; 27:45-74, 1956. *American Psychologist* 10: 805-818, 1955. Monograph, Society for Research in Child Development 28, 1963.

17-A-6 PATTERNS OF SOOTHING AND EXCITATION IN NEONATES

Purpose: To investigate the role of excitatory and inhibitory patterns in neonatal development through use of behavioral ratings and heart rate measurements. This research is part of a long-term study of regulatory principles and mechanisms which govern neonatal behavior (see Bulletin 5, *Research Relating to Children*).
Subjects: Normal, healthy, 2 to 5 day old full term babies born at Bronx Municipal Hospital Center.
Methods: Heart rate and behavioral ratings obtained for all experimental sessions. Each neonate tested at three sessions: test, retest on reactions to a series of soothing stimuli, and one session of trials of excitatory stimuli. Soothing stimuli applied when neonates are aroused are a tone, rocking, sweetened pacifier inserted in babies' mouths, immersion of babies' feet in warm water, and a control period. Each stimulus condition applied three times. Excitatory stimuli applied after feeding when neonates are quiescent are a tone, cold disc applied to the abdomen, and rocking.
Findings: Data analyzed with respect to (1) relationship between heart rate and behavioral ratings; (2) individual differences in overall soothability and in most effective soothing stimuli; (3) test-retest reliability on successive days; and (4) relationship between excitatory and inhibitory patterns.
Duration: January 1962-continuing.
Investigator(s): Sibylle Escalona, Ph.D., Professor of Psychology in Psychiatry, Wagner H. Bridger, M.D., Assistant Professor of Psychiatry, Beverly M. Birns, Ph.D., and Marion Blank, Ph.D., Instructors in Psychology, Department of Psychiatry, Albert Einstein College of Medicine, Yeshiva University, New York 61, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-A-7 INSTITUTE FOR CHILD STUDY OF PHILADELPHIA

Purpose: To develop standards and norms of physical growth, specific for children of urban Philadelphia. Longitudinal study based on annual or semi-annual follow-up of more than 2,000 children registered at the Institute.
Methods: School Series: initially based on 600 school children in 5 schools (now 22 schools), ages 6-12, "normal" medically and dentally; data collected on national and ethnic background, socio-economic status of parents, medical and dental health history of child, height and weight of parents and siblings, anthropometric measurements and X-rays. American Negro Series: 150 Negro children with normal occlusion selected to study with a view to establishing tentative standards of facial growth. Pilot Study Series: extensive study of 75 children, 6 to 8 years of age, seen every three months for measurements, X-rays, dietetic histories, careful medical examination data, blood chemistry, oral pathology data, etc. Orthodontic Series: all children accepted by Orthodontic Clinic had lateral and postero-anterior head films taken and detailed measurements of head and face made. Orthodontic Treatment Series: a small pilot study of 15 white boys, age 11 to 15, with a certain type of malocclusion accompanied by V-shaped, high-vaulted palate; 15 with identical orthodontic condition; 15 with normal occlusion--first group to receive free orthodontic care, second and third groups to receive free dental care but no orthodontic treatment. Cleft Palate Series: growth pattern of 250 children with cleft lip and/or palate. Cooley's Anemia Series: family-line investigation of 25 children for traits other than the disease such as facio-dental growth dysplasia. Endocrine Series: evaluation of degree of growth deviation with follow-up to study effect of endocrine therapy upon growth pattern. Behavioral Series: 110 first, second, and third graders rated in terms of physical growth progress and simultaneously in terms of grades, emotional stability, and other aspects of classroom behavior to see if there is any real correlation.
Initiation date: 1947.
Investigator(s): Wilton M. Krogman, Ph.D., Director, Institute for Child Study of Philadelphia, Philadelphia, Pa.
Cooperating group(s): Institute for Child Study of Philadelphia (sponsored by Graduate School of Medicine and Evans Institute of Dentistry of University of Pennsylvania and Children's Hospital of Philadelphia); Philadelphia Department of Public Health; Philadelphia Board of Public Education; Public Health Service, U. S. Department of Health, Education, and Welfare.

17-A-8 LONGITUDINAL STUDY OF DENTOFACIAL, SKELETAL, PHYSICAL GROWTH AND NUTRITION OF CHILDREN

Purpose: To study the dentofacial growth of children, standards of nutrition, caries increment as related to nutrition, assessment and skeletal age as related to facial growth, variations in physique and its effect on dentofacial growth. Twins are also being studied to determine heritable traits.
Subjects: 400 children, including 40 pairs of twins, ages 3 to 18 years, who have been observed for periods of 3 to 10 years.
Methods: Cephalograms, hand, wrist, and calf X-rays, intra-oral X-rays, study casts, anthropometric measurements, photographs, oral examination, and one-week food diary. Children are examined every six months until 14 years of age.
Initiation date: 1950.
Investigator(s): Bhim S. Savara, D.M.D., M.S., Professor and Head, Child Study Clinic, University of Oregon Dental School, 611 S.W. Campus Dr., Portland 1, Oreg.
Cooperating group(s): University of Oregon Dental School; Oregon State Board of Dental Examiners; Tektronix Foundation, Inc.; Medical Research Foundation of Oregon; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Recent articles: Radiology, April 1961; July 1962; Journal of Dental Research, July-August 1961; July-August 1962. Human Biology, February and September 1962.

BEST COPY AVAILABLE

17-A-9 RADIOGRAPHIC ATLASES OF SKELETAL DEVELOPMENT

Purpose: To develop radiographic standards of skeletal development for use as reference standards for children.
Subjects: 4483 Cleveland children; 134 Boston children.
Methods: Series of films of hand, elbow, shoulder, hip, knee, and foot of healthy children are used to identify the modal (moderate) rate of bone development. Revisions or initial standards are prepared as needed to provide standards of reference.
Duration: 1948-1964.
Investigator(s): S. Idell Pyle, Ph.D., Research Associate, Department of Anatomy, Western Reserve University, Cleveland, Ohio; and William Walter Greulich, Ph.D., Professor and Head, Department of Anatomy, Stanford University, Stanford, Calif.
Cooperating group(s): Bolton Study (Cleveland); Department of Maternal and Child Health, Harvard University School of Public Health.
Publication: Current standards: Radiographic Atlas of Skeletal Development of Elbow and Shoulder; Radiographic Atlas of Skeletal Development of Hip. The latest standard for the hand was published in 1959; foot in 1962; and knee in 1955.

17-A-10 COLLABORATIVE STUDIES IN CEREBRAL PALSY AND OTHER NEUROLOGICAL AND SENSORY DISORDERS OF INFANCY AND CHILDHOOD

Purpose: To investigate factors and conditions affecting parents: (1) conditions of pregnancy itself, such as infections, trauma, bleeding, drugs, and progress of labor; (2) environmental factors influencing mother, such as social and economic conditions, emotional stress, and medical care; (3) biological factors in parents such as age, parity, medical and reproductive history, and immunologic characteristics; (4) genetic background of parents. To investigate in the offspring: disorders of the nervous system of all products of conception at time of delivery or appearing during infancy or early childhood, including cerebral palsy, mental subnormality, behavioral disorders, etc. A detailed investigation of the independent variables will be directed toward the re-evaluation of the effect of factors already suspected, the elucidation of the mechanism through which these factors are operative, and the discovery of factors neither presently known nor suspected.
Subjects: Approximately 8,000 live births per year from 15 collaborating institutions for five years. Offspring followed until school age.
Methods: Analysis of pooled information collected in a uniform way in a number of medical centers throughout the country from women studied during pregnancy and from their offspring followed throughout infancy and early childhood. Intensive study of limited number of cases; less intensive study of as many damaged children and abnormal pregnancies as possible.
Initiation date: 1956.
Investigator(s): Richard L. Masland, M.D., Coordinator of Project, National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington, D. C. Collaborating institutions: Children's Hospital, San Francisco, Calif.; Yale University School of Medicine, New Haven, Conn.; Charity Hospital, New Orleans, La.; Johns Hopkins University School of Medicine, Baltimore, Md.; Boston Lying-In Hospital and Children's Medical Center, Boston, Mass.; University of Minnesota Medical School, Minneapolis, Minn.; Columbia-Presbyterian Medical Center and New York Medical College, New York, N. Y.; University of Buffalo, Buffalo, N. Y.; University of Oregon Medical School, Portland, Oreg.; Children's Hospital of Philadelphia and Pennsylvania Hospital, Philadelphia, Pa.; Brown University, Providence, R. I.; University of Tennessee Medical School, Memphis, Tenn.; Medical College of Virginia, Richmond, Va.
Publication: Johns Hopkins Magazine, June 1959.

17-A-11 RESEARCH ON SPEECH AND LANGUAGE DISORDERS

Purpose: To investigate etiology, prevention, and rehabilitation in speech and language disorders of children with cerebral palsy, aphasia, cleft palate, endocrine disorders, Mongolism, or mental deficiency.
Subjects: Study group chosen from clinical population, approximately 1,500 cases, and matched with normal controls.
Methods: Basic studies on anatomy and functional laryngx, respiration, etc., including X-ray measurements and similar techniques; various other research methods (generally behavioral items) depending upon area under study.
Initiation date: 1934.
Investigator(s): Martin F. Palmer, Sc.D., Director, Institute of Logopedics, 2400 Jardine Dr., Wichita 19, Kans.
Cooperating group(s): Federally supported.
Publication: Articles appearing regularly in *Journal of Speech and Hearing Disorders*, *Journal of Speech and Hearing Research*, *Cerebral Palsy Review*, etc.

17-A-12 METHODS IN CHARACTER DEVELOPMENT

Purpose: To develop more effective methods in character development in cooperation with character training agencies.
Subjects: Children and families in about 30 participating church schools and other groups widely spread in the United States.
Methods: Experimental use of curriculum by participants. Reports of experimental efforts analyzed and curriculum revised on basis of findings. Methods of character education then developed and reported. Emphasis is on character growth in children.
Findings: Anticipate development of instructions for writing character building curricula. These will include types of homes, children, and classes for character development and descriptions of age-level potentials for children.
Initiation date: 1936.
Investigator(s): Ernest M. Ligon, Ph.D., Director, Character Research Project, Union College and University, Schenectady, N. Y.
Cooperating group(s): Lilly Endowment, Inc.
Publication: Published in *Union College Studies in Character Research*. Also *Dimensions of Character*, Macmillan, 1956.

GROWTH AND DEVELOPMENT

General

17-B-1 **MENTAL, MOTOR, AND BEHAVIOR DEVELOPMENT IN FIRST 30 MONTHS OF LIFE AS MEASURED ON NANCY BAYLEY'S SCALES OF DEVELOPMENT**

Purpose: To revise and restandardize the scales which were first published in 1933 and 1935, and to study ethnic and cultural differences in development during first two years of life.
Subjects: (1) 1200 infants, aged 1 to 15 months, tested in 10 cities by psychologists of the NINDB Perinatal Research Project; (2) approximately 500 infants, aged 1 to 30 months, tested in the NIMH Laboratory of Psychology; and (3) 160 children, aged 18 to 30 months, tested at the University of California. All are presumably normal infants, about 60 percent are white, 40 percent are Negroes, and a few are of other ethnic origin.
Methods: Psychologists from various perinatal research centers were trained in administration of tests to infants up to 16 months old. All records were sent to principal investigator for statistical analyses. On basis of these analyses, selected items were retained in revised scale. Scores obtained on revised scale have been further analyzed for comparisons of means and SDs by age, according to ethnic groups, sex, birth order, and parent's education.
Findings: Preliminary analysis of the 18 to 30 month tests have resulted in a scale with tentative norms for these ages. Further analyses of this portion of scales remain to be completed. Scales show good age-progression, internal consistency, and reliability. No significant differences were found in scores between boys and girls 1 to 15 months old, higher and lower education of parents, birth order, or Negroes and whites with but one exception: Negro babies in the first 13 months of life score higher, on the average, than whites.
Duration: 1958-1965.
Investigator(s): Nancy Bayley, Ph.D., Institute of Human Development, University of California, Berkeley 4, Calif.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-B-2 **RELATIONSHIP OF EARLY INFANT TESTS, I.Q., AND GROSS MOTOR BEHAVIOR AT THIRTY MONTHS AND BEHAVIOR IN THE PREMATURE CHILD RELATED TO NEUROLOGIC DEFICIT AND SOCIAL SITUATION**

Subjects: 250 Negro premature infants weighing 2100 grams or less at birth; 50 term infants as a comparison group.
Methods: Each child was given neurologic, psychologic, and social work ratings at stated periods beginning at age three days, the last at two and one-half years. Comparisons were made between neonatal findings and child's scores.
Findings: There is a relationship between gross motor development and I.Q. in the premature child at 30 months, and between gross motor development and behavior. Gross motor development is a measure of neural intactness. Noxious social situation is related to deviant behavior in the brain injured child.
Duration: 1956-1963.
Investigator(s): Alfred Freedman, M.D., Professor and Chairman, and Helen Wortis, M.S., Assistant Professor, Department of Psychiatry; Caryl Heimer, M.D., Assistant Professor, Departmet of Pediatrics, and Rhoda Cutler, M.A., Research Psychologist, New York Medical College-Flower and Fifth Ave. Hospitals, New York 29, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health

Service, U. S. Department of Health, Education, and Welfare.
Publication: Two papers will be presented to Society for Research in Child Development, April 1964. Mimeographed copies on request.

17-B-3 ADAPTIVE PROCESSES IN INFANT-ENVIRONMENT INTERACTION

Purpose: To investigate motility and crying patterns in infants over the first 10 days of life in relation to characteristics of care-taking intervention.
Subjects: Normal newborn infants with uncomplicated delivery; control group of infants receiving routine nursery care will be compared with groups in which dimensions of care can be varied experimentally.
Methods: Use of a specially designed automatic monitor, which records a continuous 24 hour tracing of motility and crying behavior over the first 10 days of life. Activity and distress cycles thus indicated will be studied in relation to timing and characteristics of interventions.
Duration: September 1963-December 1965.
Investigator(s): Louis W. Sander, M.D., Associate Research Professor of Psychiatry, School of Medicine, Boston University, Boston, Mass.
Cooperating group(s): Boston University-Massachusetts Memorial Hospitals; Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication describing investigation, instrument, and method is expected in 1964. Data from experimental group should follow in 1965.

17-B-4 STIMULUS CONDITIONS, INFANT BEHAVIORS, AND SOCIAL LEARNING IN DIFFERENT CHILD-REARING ENVIRONMENTS

Purpose: To describe and assess stimulus conditions provided, infant behaviors, and the opportunities for adaptive and social learning those stimuli constitute for the infant behaviors during the first year of life.
Subjects: Infants of four age groups (8, 16, 24, and 32 weeks) from four different child-rearing environments in Israel: residential institution, Kibbutz, only-child, and multiple-child middle class town families.
Methods: Codified observation procedure developed and used with a record sheet marked off in half-minute units. Included were reliable observation categories covering: background events, setting, subject's behaviors, various stimuli provided particularly by caretakers, interaction exchanges between subject and his environment, and subject's gross activity level. Occurrence of behaviors, but not their durations, were recorded continuously throughout the observation period.
Findings: Data currently being readied for computer analysis; first findings should be available by 1965.
Duration: 1961-1966.
Investigator(s): Hava B. Gewirtz, Ph.D., Research Associate, Institute for Behavioral Research, 2426 Linden Lane, Silver Spring, Md., and Jacob L. Gewirtz, Ph.D., Research Psychologist, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.
Cooperating group(s): Department of Psychology, Hebrew University of Jerusalem; Computer Science Center, University of Maryland; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Preliminary report to be published in B. Foss (Editor), *Determinants of Infant Behaviour*, Vol. 3, New York, Wiley, 1964. Several monograph reports beginning in 1965.

Physical

17-C-1 EFFECTS OF OBSTETRIC ANALGESIA ON NEONATAL SUCKING

Purpose: To study the effects of central nervous system depressants administered to the mother during the course of labor and delivery upon sucking behavior of the infant during the first week of life. It is thought that the study of factors which affect early maternal-infant feeding relationships may be relevant to understanding subsequent physical and mental maturation.
Methods: A method of recording infant sucking activity developed by the investigators (see Bulletin 15, Research Relating to Children) will be used. Sucking behavior of a group of babies whose mothers have received large doses of obstetric analgesia and inhalation anesthesia during labor and delivery will be compared with a group whose mothers received no such medication.
Investigator(s): Reuben E. Kron, M.D., Associate in Psychiatry, Katharine E. Goddard, M.D., Associate in Pediatrics, and Marianne Drann, R.N., University of Pennsylvania, Philadelphia 4, Pa.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-C-2 EXPENDITURE AND FOOD INTAKE OF ADOLESCENTS AND ELDERLY PEOPLE

Purpose: To provide information on normal food intake and total energy expenditure of adolescents and elderly people. These two groups are especially important since they are particularly vulnerable in conditions where food may be in short supply. Knowledge about food intake and energy expenditure of these groups is inadequate at the present time.
Methods: Field surveys will cover the different social and economic groups in Scotland within the age ranges mentioned. These surveys will consist of measurements of total food intake and total energy expenditure on individual subjects.
Investigator(s): Dr. J. V. G. A. Durnin, Elaine C. Blake, Fiona Aitken, and Jennifer M. Hockley, Institute of Physiology, University of Glasgow, Glasgow, W.2., Scotland.
Cooperating group(s): National Institute of Arthritis and Metabolic Diseases, Public Health Service, U. S. Department of Health, Education, and Welfare.

Perceptual, cognitive, and motor

17-D-1 DEVELOPMENTAL STUDY OF COORDINATED EYE MOVEMENTS IN THE HUMAN INFANT

Purpose: (1) To determine the development of visual acuity in the newborn, in the infant, and in the preschool child; (2) to study the degree of binocular coordination at birth, in infancy, and in early childhood; and (3) to relate maturation of the sensory and motor apparatus of the eye with presence or development of extraocular muscle imbalance.
Methods: Electro-oculography, D.C.
Findings: Newborns have a graded Snellen acuity of at least 20/150; fixation reflex is present at birth.
Duration: 1962-continuing.
Investigator(s): Glenn O. Dayton, Jr., M.D., Assistant Professor of Surgery/Ophthalmology, and Margaret H. Jones, M.D., Associate Professor of Pediatrics, University of California, Los Angeles 24, Calif.
Cooperating group(s): National Institute of Neurological Diseases and Blind-

ness, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: *Archives of Ophthalmology*, two issues in press; *Neurology*, in press.

17-D-2 SENSORY DISCRIMINATION AND LEARNING IN HUMAN INFANTS

Purpose: To explore learning capabilities of children under one year of age; to utilize these techniques for the assessment of discriminative capabilities of infants.
Subjects: Newborns at Providence Lying-In Hospital, and same infants seen at Child Development Study Follow-up Center.
Methods: Classical and operant conditioning techniques.
Duration: 1958-1965.
Investigator(s): Lewis P. Lipsitt, Ph.D., Department of Psychology, Brown University, Providence 12, R. I.
Cooperating group(s): Providence Lying-In Hospital; National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-D-3 EARLY AUTONOMY IN CHILDREN

Purpose: To study mother-child interaction in order to ascertain what effects, if any, parental behavior has on autonomous behavior. This behavior (now called "competence" rather than "autonomous") is defined as the ability of the child to initiate and sustain motor and visual-motor activity at a given level of complexity and self sufficiency.
Subjects: 32 mother-child pairs. Children classified as high and low in competence, and mothers classified as laissez faire, prohibiting, stimulating, and mixed.
Methods: Children followed at four-week intervals from their 12th to 20th month. Observation in home during child's time of free play. Descriptive accounts evaluated at three levels: detailed scoring of each behavior, overall ratings, and an interpretative description.
Duration: Ausust 1963-August 1966.
Investigator(s): Charles Wenar, Ph.D., Assistant Professor, University of Pennsylvania School of Medicine, Philadelphia 4, Pa.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Articles or a monograph planned.

Communication

17-E-1 EFFECTS OF TRAINING CHILDREN IN COMMUNICATION SKILLS

Subjects: Small groups of 9 to 12 year old children.
Methods: A communicator, drawn from each group, communicates enough information to the other members to allow them to perform a specified task. The other children then attempt to perform this task as a tape recording of the communication is played back. Group discussion follows. Communicators obtain three kinds of feedback about their message: (1) listening to their own taped voices; (2) observing whether other children can perform the task; and (3) hearing criticism of the other children. Group members take turns

as communicator. Tasks fluctuate between two extremes: those requiring brief instructions and those requiring complex ones. Evaluation of effects of this training experience from taped communications and from changes recorded on a variety of communication pretests and post-tests.
Investigator(s): Charles Luther Fry, Jr., Ph.D., Assistant Professor of Psychology, University of Virginia, Charlottesville, Va.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-E-2 REINFORCING EFFECTS OF REFLECTED VOCALIZATIONS

Purpose: Within the real life situation of a nursery school, to test hypothesis that child's perception of his own vocalizations serves, in general, as reinforcement for vocal behavior.
Subjects: 22 preschool children, 10 boys and 12 girls, enrolled in the nursery school, Department of Psychology, University of Maine in fall 1963.
Methods: Telephone set installed in nursery school room to record vocalizations of children into the receiver and, as desired, return either voice-controlled white noise (control condition) or vocalizations of individual children on a two-second delay basis via earpiece of telephone. Access to telephone limited to half hour each day during free-play period. Spontaneous vocalizations recorded first 10 days; white noise returned next five days; vocalizations reflected next 10 days; and white noise returned last five days.
Findings: Vocal behavior of children increased above the "no-reflection" and "white-noise" reflection conditions when children's vocalizations were returned to them on a two-second delay basis. Children tended to repeat the vocal sounds which they uttered during period of delayed "self-reinforcement".
Duration: February 1963-September 1964.
Investigator(s): Joseph J. Antonitis, Ph.D., Professor of Psychology, University of Maine, Orono, Me.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Mimeographed report will be made available by summer 1964.

Learning

17-F-1 ASSOCIATIVE PROCESSES IN CHILDREN'S VERBAL LEARNING

Purpose: To investigate the role of simple associative processes in perception, learning, recall, and mediated generalization of children. To determine some factors underlying differences between children and adults in these areas.
Subjects: Children in grades 4 to 12.
Methods: Paired-associate learning, tachistoscopic recognition, clustering in recall.
Findings: In contrast to studies with adults, this study shows that differences in paired-associate learning as a function of associative strength may be demonstrated with children. Children show less clustering in recall and more associative generalization than adults. Studies of mediated association using natural language associates may also be shown with children in paired-associate learning.
Duration: September 1962-indefinite.
Investigator(s): David S. Palermo, Ph.D., Associate Professor, Department of Psychology, Pennsylvania State University, University Park, Pa.
Cooperating group(s): National Science Foundation.
Publication: To be submitted to appropriate journals.

17-F-2 CURIOSITY AROUSAL AND ITS EFFECTS ON LEARNING

Purpose: To determine: (1) the effects of age and ability on curiosity arousal; (2) the effects of complexity, ambiguity, abstractness and incongruity on curiosity arousal; and (3) the effects of curiosity arousal on learning.
Subjects: 60 children (30 each from second and sixth grade classrooms) representing equally I.Q. ranges 92-108, 112-128, and above 132.
Methods: Observation in a semistructured situation, presentation of stimulus materials by S-controlled tachistoscope, and immediate and delayed recall of objects in observation situation.
Duration: January 1963-February 1964.
Investigator(s): N. L. Pielstick, Ph.D., Associate Professor of Psychology, Northern Illinois University, DeKalb, Ill.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

17-F-3 SEQUENCE CHARACTERISTICS OF TEXT MATERIALS AND TRANSFER OF LEARNING

Purpose: To obtain information on the relative effectiveness and efficiency for retention and transfer of text materials varying in sequencing characteristics referred to loosely as "guided discovery" and "direct exposition". Previous studies reported in the literature have lacked specification of psychological parameters of the text materials and have seemingly attributed obtained results to sequencing of materials presented without regard to what was being presented.
Subjects: About 200 high school or college students randomly assigned to treatments.
Methods: Following review of the literature and development of experimental verbal learning sequences, time and error scores, retention, and transfer measures will be obtained. Analysis involves simple comparisons of means and variances.
Duration: September 1963-August 1966.
Investigator(s): Gabriel M. Della-Piana, Ph.D., Associate Professor of Educational Psychology, University of Utah, Salt Lake City, Utah.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

17-F-4 SCHEDULES OF REINFORCEMENT AND DISCRIMINATION LEARNING

Purpose: To investigate effect of changes in reinforcement on object preference. Hypothesis: final preference will be shown for the object increasing in frequency of reinforcement despite initial response strength in favor of the former highly reinforced object.
Methods: Children receive different frequencies of reinforcement of two objects presented successively. In a record stage both objects are presented simultaneously and equally reinforced at a frequency midway between the former values. Measures of object preference, latency of response, and expectancy of reinforcement are made to determine if these changes in percentage of reinforcement systematically affect choice behavior.
Duration: January 1963-March 1964.
Investigator(s): Donald R. Gannon, Ph.D., Assistant Professor of Psychology, Louisiana State University, Lakefront, New Orleans 22, La.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Intelligence, thought, and problem solving

17-G-1 ACCELERATION OF INTELLECTUAL DEVELOPMENT IN EARLY CHILDHOOD

Purpose: To test several untried methods for accelerating young children's acquisition of cognitive skills, including reading, problem-solving sets, and several logical operations.
Subjects: For reading: 40 children aged three years; for problem-solving sets: 60 children in nursery schools, aged four years; for logical operations: varying numbers of kindergarten and nursery school children.
Methods: Pilot studies, followed by comparisons of contrasting experimental groups on standardized or specially developed measures.
Duration: July 1963-June 1966.
Investigator(s): Carl Bereiter, Ph.D., Associate Professor, Institute for Research on Exceptional Children, University of Illinois, Urbana, Ill.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Journal articles and final reports to Office of Education.

17-G-2 SKEMP AACC TESTS

Purpose: To develop tests suitable for (1) assessment of cognitive abilities of handicapped children; and (2) use with normal children where it is desired to eliminate, so far as possible, effects of previous learning and culture or to obtain a profile rather than an aggregate score.
Subjects: Children, aged 3 to 7 years.
Duration: October 1963-indefinite.
Investigator(s): Richard R. Skemp, Ph.D., Lecturer in Psychology, University of Manchester, Manchester 13, England.
Cooperating group(s): Association for the Aid of Crippled Children.
Publication: Tests will be marketed if reliability and validity are found to be satisfactory.

17-G-3 MEDIATION IN YOUNG CHILDREN

Purpose: To investigate development of mediation and possible sources of deficiency in mediation in order to further understand the process.
Subjects: Groups of 2.5 to 7 year old children.
Methods: Tasks requiring mediation given to subjects. Tasks include transposition, discrimination learning set, perceptual set, acquired equivalence and distinctiveness of cues, and double alternation. In addition to developmental studies relating performance to age, other studies will assess various conditions which on theoretical grounds should facilitate mediation or lead to development of the process.
Investigator(s): Hayne W. Reese, Ph.D., Associate Professor of Psychology, State University of New York at Buffalo, Buffalo, N. Y., 14214.
Cooperating group(s): National Science Foundation.

17-G-4 STIMULUS GENERALIZATION AS A FUNCTION OF MENTAL AGE

Purpose: To study generalization gradients as a function of mental age.
Subjects: 53 children, ages 8 to 9 years.
Methods: Stimulus generalization apparatus.

Findings: Stimulus generalization gradients inversely related to mental age. The lower the M.A., the greater the stimulus generalization responsivity.
Duration: October 1962-September 1963.
Investigator(s): Vincent J. Tempone, Ph.D., Assistant Professor, Department of Psychology, University of New Hampshire, Durham, N. H.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Submitted to Journal of Abnormal and Social Psychology.

17-G-5 EFFECTS OF ANXIETY ON PROBLEM SOLVING AND PAIRED ASSOCIATE LEARNING

Purpose: To investigate the relationship between children's anxiety and response competition in a nonverbal paired associates experiment.
Subjects: 108 of 250 fifth grade boys and girls selected on basis of anxiety scores, and divided equally into three groups--high, medium, and low anxiety.
Methods: Each anxiety group is divided into three subgroups of 12 subjects each. Subgroups are given one of three tasks which involves increasing levels of color dissimilarity between stimulus and response, i.e., three levels of S-R color competition. No subject received more than one task.
Findings: Results suggestive of relationships but not statistically significant. In simplest task, higher anxiety related to better performance; in moderately complex task, medium anxious subjects performed best while low and high anxious subjects showed inferior performance; in most complex task, medium anxious subjects tended to be worse than low and high anxious groups.
Duration: January 1962-December 1964.
Investigator(s): Joseph J. Tecce, Ph.D., Research Fellow, Adult Psychiatry Branch, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md., and Hans G. Furth, Ph.D., Department of Psychology, Catholic University of America, Washington 17, D. C.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Paper presented at American Psychological Association meetings in St. Louis, August 1962; plan publication in Child Development.

Social behavior

17-H-1 RELATIONSHIP OF PRESCHOOL BEHAVIOR TO RETROSPECTIVE REPORTS OF NEONATAL BEHAVIOR

Subjects: Three groups have been studied: one of 32 males, one of 28 females and one of 35 females; another group of approximately 30 males is being studied.
Methods: Retrospective data on sleep and sucking characteristics, tactile sensitivity, and muscle strength are obtained from mothers of two year old children. These children are brought into a research nursery school in groups of five for a period of one month. Their contact behavior with teachers and nature of their play is measured by observations, ratings, and experimental situations. Results are analyzed separately for each sex. One group in each sex serves as a cross-validation group. Additional groups of children are being studied for whom direct measures in the newborn period are available as well as later retrospective information.
Duration: Not reported-1964.
Investigator(s): Richard Q. Bell, Ph.D., Chief, Section on Infant Development, Child Research Branch; George M. Weller, Mary F. Waldrop, Director of Nursery School, and Robert J. Mahon, National Institute of Mental Health,

Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-H-2 PROGRAM OF RESEARCH ON SOCIALIZATION PROCESSES

Purpose: To study the socialization processes in young children, with particular attention to the ways in which parents, teachers, and peers influence (change and encourage) their behavior. Study will use a continuously available sample of subjects for maximal study purposes in order to investigate concurrently a group of research questions which have considerable overlap in relevant variables. Study will make use of certain core variables measuring: (1) adult actions and values assumed to determine specific responses and general behavioral dispositions of the child; (2) characteristic behavior of the child (usually viewed as the consequent variables); (3) parental responses in reaction to child characteristics; and (4) characteristics of environmental settings influencing behavior.
Methods: Behavioral observations will be obtained in natural and experimental settings. Interviews will be used to secure data on beliefs and values, and on subject's view or perceptions of his experience. Evaluations of different sources and techniques for obtaining data will be made by comparisons of simultaneously recorded data using same or different sources and techniques. One check on methodology will employ the interview by Sears, et al., from Patterns of Child Rearing, and data from this interview will be studied in terms of independently obtained observational measures involving nursery children, their parents, and teacher.
Investigator(s): Marian Radke-Yarrow, Ph.D., Chief, Section on Developmental Psychology, John D. Campbell, Ph.D., Research Psychologist, Roger V. Burton, Ph.D., and Doris E. Hawkins, Social Science Analysts, Laboratory of Socio-environmental Studies, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.
Cooperating group(s): National Child Research Center.

17-H-3 INDIVIDUAL BEHAVIOR IN GROUPS

Purpose: To determine the relationship, if any, between behavior in groups and responses given in a related study, "Survey of Teenage Attitudes and Interests: Part 2" (17-W-9, Research Relating to Children). Also, to determine the relative effectiveness of counselor's recording of adolescent's behavior in a social group work agency day camp.
Subjects: Total of 70 randomly selected Jewish adolescent girls (N=42) and boys (N=28) who also participated in the attitudes and interests study.
Methods: Use of a rating scale developed by Dr. Irving Canter (Jewish Center Program Aids, March 1946) designed to help in analyzing individual reactions and behavior patterns in a group. Scale includes data on social status, participation, social tendencies, emotional tendencies, general observations, and a summary. Counselors who had completed extensive narrative reports on subjects following use of the scale, were asked to rate the adolescent's behavior with respect to 36 questions, using a score of 1 to 5 for each question.
Duration: August 1963-June 1964.
Investigator(s): Joel M. Carp, B.A., East Flatbush-Rugby YM-YWHA, Associated YM-YWHA's of Greater New York, 1127 East 102nd St., Brooklyn, N. Y. 11236.
Publication: A report should be completed in June 1964, and will be available upon request to the investigator.

17-H-4 CREATIVE THINKING ABILITIES AND PEER CONFORMITY IN FIFTH GRADE CHILDREN

Purpose: To compare peer-conforming behavior of highly creative fifth grade pupils with that of low creative fifth grade pupils in a controlled, small group situation, in relation to: (1) nature of task presented; (2) sociometric composition of group; and (3) interaction, if any, of these variables.
Subjects: A large, suburban, public school system in the Cleveland-Akron area will be chosen, and all fifth grade pupils (about 1,000) will be enrolled in the study.
Methods: A battery of tests of creative thinking, a test of intelligence, and a sociometric nomination form will be administered to subjects. On basis of resultant scores, pupils will be divided into small groups of five members each, including one high- or low- creative pupil. Small groups will then be subjected to Asch-Crutchfield type problem-solving sessions to obtain data on peer conformity.
Duration: October 1963-March 1965.
Investigator(s): Kaoru Yamamoto, Ph.D., Assistant Professor of Education, Kent State University, Kent, Ohio.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report to Office of Education. Partial reports planned in Journal of Educational Psychology, Journal of Abnormal and Social Psychology, and Child Development.

17-H-5 SEX BEHAVIOR STUDY OF VENEREALLY INFECTED TEENAGERS

Purpose: To attempt to determine some of the socio-psycho-economic factors that contribute to a venereal infection, with ultimate plan of attempting to alter promiscuous sex behavior by education and counseling.
Subjects: A teenage venereal disease clinic population in a large urban area.
Methods: Psychiatric depth interviews, case histories, and case follow-ups.
Investigator(s): John W. Lentz, M.D., Chief, Venereal Disease Control Section, Philadelphia Department of Public Health, Philadelphia, Pa. (Reported in Sources of Morbidity Data, 1962.)
Cooperating group(s): Philadelphia Department of Public Health; Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: A paper will be published by the Public Health Service upon completion of study.

PERSONALITY AND ADJUSTMENT

Assessment of personality

17-J-1 SITUATIONAL TESTING OF SOCIAL PSYCHOLOGICAL VARIABLES IN PERSONALITY

Purpose: To study the efficacy of measuring social variables in personality through "role tests," with performance rated by observers. Study will attempt to replicate earlier findings with a group of juvenile delinquents, and to refine test situations and rating scales. Applications to such practical concerns as identification of delinquent types in order to permit more effective differentiation of their rehabilitation needs are planned.
Methods: Hypothetical situations in which subjects are asked to play role of juvenile court judge and a youth whose friend has stolen money are used. Among variables measured in this way are role-playing facility and concepts of functions of authority held by subjects. The approach through role testing is viewed as an intermediary between formal "objective" and "projective" testing on the one hand, and naturalistic observation of unstructured behavior on the other. It is hoped that study will lead to development of more effective methods for the study of behavior and personality in a natural setting and, ultimately, toward development of more adequate personality theory.
Duration: 1962-1963.
Investigator(s): Jerome Beker, Ed.D., Youth Development Center, Syracuse University, Syracuse, N. Y. (formerly Research Psychologist, Berkshire Farm for Boys, Canaan, N. Y.)
Cooperating group(s): American Academy of Arts and Sciences.
Publication: Planned in late 1964.

17-J-2 PSYCHOLOGICAL TEST PERFORMANCE OF CHILDREN ON A SUBURBAN INDIAN RESERVE

Purpose: To explore validity of certain psychological tests for use with this population, and to describe any idiosyncracies in their development.
Subjects: Children, 9.5 to 11.5 years, attending school on the reserve.
Methods: Group testing with Thurstone Primary Mental Abilities Test; and individual testing of a sample, using Rorschach, Bender, Picture Arrangement subtest of WISC, "Who Are You" enquiry, etc.
Findings: (1) Steady decline in performance from age 9.5 on the Reasoning, Number, and Verbal sections of the PMA, equivalent to a drop of over 10 I.Q. points per year, with r.= -0.814 when two-month age groups are used.
Duration: Spring 1963-1965.
Investigator(s): H. B. M. Murphy, M.D., Ph.D., Associate Professor, and Barbara Wainrib, M.A., Psychologist, Department of Psychiatry, McGill University, Montreal, Que.
Cooperating group(s): Department of Immigration and Citizenship.

Processes and factors in personality

17-K-1 MODALITY PREFERENCE AND BODY IMAGE AMONG CHILDREN

Purpose: To describe the development of visual cue preference from age 3

through 16; to determine whether changes in modality preference are accompanied by corresponding changes in body image.
Subjects: 160 "normal" children.
Methods: Administer techniques designed to measure modality preference and body image. Differences attributable to age and sex are described for visual cue preference and for the level of significance assumed by the eyes in the body image, along with interaction effects.
Investigator(s): Kenneth L. Shewmaker, Ph.D., Clinical Psychologist, Veterans Administration Hospital, 921 N. E. 13, Oklahoma City, Okla.
Cooperating group(s): Veterans Administration.

17-K-2 EFFECTIVENESS OF SENSORY-MOTOR TRAINING IN PROMOTING GENERALIZED BODY IMAGE DEVELOPMENT IN CHILDREN

Purpose: To determine whether intensive sensory-motor training results in generalized body image differentiation in intellectually normal children.
Subjects: 16 intellectually normal public school kindergarten students; a control group.
Methods: Kephart's methods for the training of skills involving postural adjustment, balance, coordination and orientation in regard to the position of the members of the body used to give intensive sensory-motor training to the experimental group; control group given a comparable amount of individualized attention, but within the context of regular classroom activities. Kephart suggests that generalization occurs from specific training tasks to the establishment of a more differentiated body image. If such generalization does occur, subjects trained according to Kephart's procedures might be expected to show improvement in other behaviors which are also postulated to depend on a differentiated body image. This expectation regarding generalization from specific training was tentatively confirmed in a recent pilot study by Ball and Edgar, but number of subjects was too small to permit definite conclusions.
Duration: December 1963-June 1964.
Investigator(s): Thomas S. Ball, Ph.D., and Clara Lee Edgar, M.A., Clinical Psychologists, Pacific State Hospital, Box 100, Pomona, Calif.
Cooperating group(s): Bonita Unified School District; California State Department of Mental Hygiene.
Publication: Publication is planned.

17-K-3 FEARS IN HEALTHY AND HOSPITALIZED CHILDREN

Purpose: To investigate: (1) which concepts arouse fears in healthy children; (2) shifts, if any, in anxiety-proneness of children who are sick, hospitalized, or undergoing surgery; and (3) persistence of any such changes after returning home.
Subjects: Two groups of 100 children each, aged 4 to 8, with similar socioeconomic background; one group healthy, the other hospitalized and undergoing surgery.
Methods: One anxiety index computed for each healthy subject on basis of newly developed test. Similar anxiety indices for hospitalized subjects computed before surgery, after surgery, and four weeks after return home. Group means compared and items analyzed.
Duration: Fall 1963-1965.
Investigator(s): Maria D. Simon, Ph.D., Research Associate, and Hans Strotzka, M.D., Institute for Advanced Studies, Universitatsstr. 7, Vienna 1, Austria.
Cooperating group(s): Ford Foundation.
Publication: Monograph.

17-K-4 RELATIONSHIP BETWEEN SOME FACTORS OF "PARENTAL DEPRIVATION" AND CAPACITY TO DELAY NEED-GRATIFICATION

Purpose: To explore the relationship between some gross parental separation factors (age at initial separation from parent or parents; duration of separation in substitute homes; and number of separation movements) by employing a "retrospective" follow-up approach to test three hypotheses: (1) subjects initially separated between ages of six months to five years will show less delay capacity than subjects separated after age five; (2) there will be a significant negative relationship between duration of separation and delay capacity; and (3) there will be a significant negative relationship between number of separation movements and delay capacity.
Subjects: 103 boys of average intelligence, ages 9 to 12 years, sampled from six Michigan child-care institutions designed to care for "dependent and neglected" children separated from their homes.
Methods: Three measures of delay capacity were individually administered: (1) a story completion technique, devised by the author, consisting of five incomplete stories judged to measure five different needs in relation to gratification delay capacity; (2) Rosenberg-Sutton-Smith Impulsivity Scale; and (3) simple task of delay of gratification.
Findings: Hypothesis (1) was confirmed for the mother. Statistical analyses indicated that age at initial separation from the mother is more critical for the development of delay capacity in preadolescents than is initial separation age from the father. Hypothesis (2) was confirmed for capacity to delay need-affiliation gratification, i.e., the greater the duration of separation, the less the ability to delay need-affiliation gratification. Hypothesis (3): on the whole, frequency of separation movements were not significantly related to delay capacity.
Duration: 1962-June 1963.
Investigator(s): Leonard P. Campos, Ph.D., Assistant Professor of Psychology, University of the Pacific, Stockton 4, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Study available from Michigan State University microfilm library of doctoral dissertations; other publication planned.

17-K-5 MOTIVATION OF CHILDREN

Purpose: Study of effect of praise and blame on performance of children.
Subjects: 720 Negro and white children of both sexes, of 3 I.Q. levels (low, medium, and high on CTMM), and drawn from 4 grade levels (2, 4, 7, and 10).
Methods: Subjects are given two trials on a 32-card discrimination task. Between trials, subjects are given praise, blame, or a control treatment. Main effects of reward, and interactions will be studied. Analysis of variance (repeated measure type) will be employed in evaluation.
Duration: January-December 1963.
Investigator(s): Wallace A. Kennedy, Ph.D., Assistant Professor, and Hermon C. Willcutt, M.A., Research Assistant, Department of Psychology, Florida State University, Tallahassee, Fla.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Monograph and other publication planned.

17-K-6 DETERMINANTS OF FANTASY AND OVERT AGGRESSION IN CHILDREN

Subjects: Third grade children.

Methods: Subjects were presented with a series of slides depicting children and adults in a variety of aggressive situations and were asked to rate children in the pictures on five point scales of angry, scary, and wrong. A peer nomination inventory was employed to obtain subject ratings of other children on a variety of aggressive behaviors. Data were analyzed for (1) correlations among the three picture sorts; (2) mean rating of pictures as a function of their characteristics (e.g., physical vs. verbal aggression, adult to child vs. child to adult aggression, etc.); and (3) relationships between peer nominations and picture ratings.

Findings: Data indicate that aggression by children to adults is judged to be more wrong than aggression by adults to children. Girls who are judged to be aggressive by their peers tend to rate pictures as more scary than nonaggressive girls, while boys rated by their peers as being aggressive tend to rate children in the pictures as more angry than do nonaggressive boys. Further research is planned to explore this suggestion that there may be sex differences in the dynamics of aggression.

Duration: October 1962-September 1964.

Investigator(s): Leigh M. Triandis, Ph.D., Associate Professor of Psychology, University of Illinois, Urbana, Ill.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-K-7 TRANSMISSION OF AGGRESSION: PEER VS. ADULT MODELS

Purpose: To test the relative influence of peer and adult models in shaping children's aggressive responses.

Subjects: 30 boys and 30 girls from a college elementary and nursery school. Subjects ranged in age from 41 to 76 months with a mean age of 61 months.

Methods: Children were divided into four experimental groups and a control group. Subjects saw the assigned aggression model on film and then were mildly frustrated. The amount of subsequent imitative aggression was scored. The control group was frustrated, but did not see a film prior to scoring their aggressiveness.

Findings: No significant difference was found between the influence of peer and adult models in shaping aggressive responses. Exposure to the films was an effective means of shaping children's aggression. Boys were more willing to imitate the model's behavior than were girls.

Duration: January 1963-June 1964.

Investigator(s): David J. Hicks, Ph.D., Assistant Professor of Psychology, Chico State College, Chico, Calif.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: Manuscript submitted to *Journal of Abnormal and Social Psychology*.

17-K-8 GENERALITY OF SOCIAL SCHEMAS IN CHILDREN

Purpose: To investigate the effects of age, sex, and socialization variables on the use of "social schemas" as described by Kuethe.

Subjects: Elementary and secondary school children varying in age, sex, socio-economic level, and "normal" vs. delinquent status.

Methods: Kuethe's procedures, requiring subjects to arrange silhouettes representing human and geometric figures.

Duration: Spring-fall 1963.

Investigator(s): Rae Carlson, Ph.D., Assistant Professor of Psychology, Orange State College, Fullerton, Calif.

Publication: Publication in professional journal planned.

17-K-9 DEVELOPMENT OF CONCEPTS OF PERSONALITY CONSTANCY

Purpose: To study child and adult concepts of interpersonal relations.
Methods: Identification of tacit assumptions children and adults make about other people's behavior, with particular attention to their assumptions about others' benevolence, self-interest, and attitudes; prediction of subject's judgment of another person's strength of motivation, attitude, etc.
Investigator(s): Alfred L. Baldwin, Ph.D., Professor and Head, Department of Child Development, and Nina Lambert, Ph.D., Research Psychologist, New York State College of Home Economics, Cornell University, Ithaca, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-K-10 ACADEMIC COPING PATTERNS OF ADOLESCENTS IN TRANSITION FROM HIGH SCHOOL TO COLLEGE

Purpose: To identify and clarify some principles of adaptive problem-solving behavior as manifested by a sample of adolescents in transition from high school to college.
Subjects: 14 adolescents, selected for competence in academic, social, and interpersonal functioning in their senior year of high school.
Findings: Coping strategies varied with these adolescents. Strategies involved an ability to maintain a sense of worth and develop new sources of self-esteem in the new college culture, as well as an ability to manage anxiety within tolerable limits in the face of new intellectual demands.
Duration: 1959-June 1964.
Investigator(s): George V. Coelho, Ph.D., Adult Psychiatry Branch, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: *Archives of General Psychiatry* 9:433-443, November 1963.

17-K-11 PERSONALITY STUDIES IN LATE ADOLESCENCE

Purpose: To explore self-concept during late adolescence and its relationship to college choice. To explore stability of self-concept in normal subjects and disturbed patients, as well as relationship between stability of self-concept and perceptual style (field-independence).
Methods: Questionnaire for exploring relationship between self-concept and college preference developed and pretested with two groups of high school seniors. Stability of self-concept studied by administering an adjective check list to 31 normal adolescents and 11 disturbed patients.
Findings: Preliminary findings indicate significant difference in self-concept stability between normal and disturbed groups. Relationship of field-independence variable does not seem consistent with findings previously reported in the literature, using other methods of evaluating stability of self-concept.
Duration: Not reported-1965.
Investigator(s): Earle Silber, M.D., Bruce Sklarew, M.D., Sheldon J. Korchin, Ph.D., Morris Rosenberg, Ph.D., and Jean S. Tippett, Ph.D., Adult Psychiatry Branch, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Emotional and personality disturbances

17-L-1 FOLLOW UP OF CHILDREN WITH ATYPICAL DEVELOPMENT (INFANTILE PSYCHOSIS)

Purpose: To follow longitudinally the complete sample of children diagnosed at preschool age at the Putnam Children's Center as having atypical development (infantile psychosis).
Subjects: Almost 250 children diagnosed since 1943, many of whom were also treated at Putnam Children's Center.
Methods: Follow-up psychiatric visits with child and social work interviews with parents; psychological testing of the child; school and institution reports; EEG reports.
Findings: A cross-sectional summary of follow-up material on 95 percent of the 136 children diagnosed at preschool age who were over 10 on January 1, 1963 showed 59 percent absorbing enough formal learning to compete in society and over half with satisfactory psychological adjustment.
Duration: October 1957-continuing.
Investigator(s): Janet L. Brown, Ph.D., Psychologist, and David E. Reiser, M.D., Director, Putnam Children's Center, 244 Townsend St., Boston 21, Mass.
Cooperating group(s): Scottish Rite Committee on Research in Schizophrenia; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Two articles planned in *American Journal of Orthopsychiatry*.

17-L-2 FOLLOW-UP OF CHILDREN WITH PROBLEMS IN ELEMENTARY SCHOOL

Purpose: To determine number of children who are impaired in their intellectual, social, or emotional development and are deprived of school and community services which might help them overcome or minimize effects of their impairments. To determine whether membership in the group designated as "disturbed" remains constant from year to year; to discriminate between temporary and progressive types of disturbances; and, to find ways to determine early characteristics of children who develop and continue to present patterns of disturbed behavior.
Subjects: Public school children in second, fourth, and sixth grades in Onondaga County, New York in 1960-61 (exclusive of Syracuse City).
Methods: Original data were obtained for 10,000 subjects from routine school records and interviews with teachers in spring of 1961 (*Research Relating to Children*, Bulletin 13). Follow-up of these children was begun in spring of 1963, and a new cohort of second grade children was added. Analytical emphasis is placed on teacher's evaluation of the child. Responses to open-ended interview questions are studied to determine characteristics teachers commonly associate with emotional disturbances.
Findings: Out of 13,800 children in the most recent survey, the number designated by teachers as emotionally disturbed was close to 700, or five percent of total. Ratio of boys to girls was approximately two to one. Further analyses of specific characteristics of these children are in progress.
Duration: June 1960-December 1968.
Investigator(s): Isabel McCaffrey, M.S., Associate Biostatistician, Mental Health Research Unit, New York State Department of Mental Hygiene, 333 E. Washington St., Syracuse, N. Y. 13202.
Cooperating group(s): Onondaga County School Boards Association; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: *Onondaga County School Studies, Report No. 1*, October 1961. Paper read at joint session of American School Association and American Public Health Association in Kansas City, Mo., November 1963. Specific inquiries may be addressed to the Mental Health Research Unit.

17-L-3 EARLY IDENTIFICATION OF BEHAVIOR PROBLEMS

Purpose: To develop and validate methods applicable in the early identification of behavior problems among adolescents.
Subjects: All students in grades 8 through 12 (approximately 16,000) in Knoxville, Knox County, Tennessee.
Methods: As a part of the National Inventory of Aptitudes and Abilities (Project TALENT), subjects were tested in 1960 with a two-day comprehensive battery of cognitive, noncognitive, and biographical measures. Multivariate analysis will be used to identify patterns of test performance which may lead to early identification of behavior problems. The basis for selection of the study group will be: school grades and tests, truancy, suspension, dropouts, mental health referrals, psychiatric referrals, dependency information, adoption, foster home placement, and juvenile court case records. School, welfare, and social agencies will cooperate in providing these data. Study group will be compared with norms established by the entire Knox Area testing in an attempt to identify critical factors presaging serious mental health problems.
Duration: Not reported-February 1966.
Investigator(s): John T. Dailey, Ph.D., Executive Scientist, Louise W. Cureton, Ph.D., and David B. Orr, Ph.D., Research Scientists, and Kaye S. Thomas, Research Assistant, American Institute for Research, 1808 Adams Mill Rd., N. W., Washington 9, D. C.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-L-4 DEVELOPMENT OF DELAYED REINFORCEMENT IN AGGRESSIVE AND NONAGGRESSIVE ADOLESCENTS

Purpose: To test the possibility of developing a fairly high expectancy of receiving delayed reinforcement and thus demonstrate to the subjects that it is possible to work for a delayed reward.
Subjects: 80 emotionally disturbed, average intelligence adolescents, aged 14 to 17, residing in a residential treatment center (Devereux Schools).
Methods: School staff asked to rate subjects on aggressiveness. Use of immediate and delayed reward in a learning situation.
Findings: Indicate that the aggressive adolescent tends initially to prefer immediate reinforcement but can develop positive expectancies regarding probability of receiving a delayed reinforcement and change his preferences accordingly. Further relationships between degree of aggressiveness and choice of delayed versus immediate reinforcement will be explored.
Duration: June 1962-June 1963.
Investigator(s): F. Howard Buss (Ph.D. Candidate), Senior Educational Psychologist, The Devereux Foundation, Devon, Pa.

17-L-5 INCIDENCE OF MAJOR AND MINOR CONGENITAL MALFORMATIONS IN EMOTIONALLY DISTURBED CHILDREN

Purpose: To determine frequency of congenital stigmata in emotionally disturbed children in comparison with the frequency in "normal" children.
Subjects: (1) Inpatients of Children's Unit, Napa State Hospital; (2) controls from large private clinic in nearby city.
Methods: (1) Physical examination of 100 randomly selected patients in each group, with objective measurement, where available, of physical aberrations found; and (2) tabulation and statistical comparison of major and minor physical aberrations found.
Duration: September 1963-June 1964.

Investigator(s): Jesselene H. Thomas, M.D., Napa State Hospital, California State Department of Mental Hygiene, Imola, Calif.
Publication: Will be reported to Research Department, California State Department of Mental Hygiene.

17-L-6 CONTROL OF SIX AND FOURTEEN SECOND EEG POSITIVE SPIKING

Purpose: To examine symptomatology, both physiologic and psychologic, of adolescent and young adult patients admitted to the hospital for treatment of behavioral disorders; to survey all individuals admitted with a diagnosis of behavioral disorder to determine whether or not abnormal EEG rhythms exist. In many instances it has been observed that behavioral disorders are associated with 6 and 14 second positive spiking, an abnormal EEG tracing.
Subjects: It is anticipated that two groups will be under study--one with behavioral disorders and EEG abnormalities and one with behavioral disorders but no EEG abnormalities.
Methods: Subjects with and without EEG abnormalities treated with a combination of a phenothiazine tranquilizer (thioridazine) and an anti-convulsant (diphenylhydantoin), using a double-blind technique with placebo and crossover design with both groups.
Investigator(s): Charles E. Henry, Ph.D., Cleveland Clinic, 2020 E. 93rd St., Cleveland 6, Ohio; Bernard C. Glueck, Jr., M.D., Cornelis Boelhouwer, M.D., and John Donnelly, M.D., Institute of Living, 400 Washington St., Hartford 2, Conn.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-L-7 REPETITIVE MOVEMENTS IN CHILDREN

Purpose: To study the development of repetitive movements in children, their incidence in varying types of mental and physical handicaps as well as in nonhandicapped children; to experimentally evaluate methods of treating severe instances.
Duration: 1963-1965.
Investigator(s): Malcolm B. MacMillan, B.Sc.(W.A), A.B.Ps.S., Psychologist, Children's Cottages, Kew E.4, Victoria, Australia.
Publication: Possibly articles and a book.

17-L-8 REPRESSION OF ANGER AND VERBAL CONDITIONING IN ASTHMATIC AND NORMAL CHILDREN

Purpose: To investigate relationship between repression and reinforcement value of aggressive vs. neutral adults, and hostile vs. neutral content within a verbal conditioning situation; to study relationship between repression and: (1) children's reports of emotional factors as related to asthma; and (2) specific subgroups of asthmatic children.
Subjects: Approximately 80 asthmatic and 80 normal children, 9 to 12 years old.
Methods: Lesser's Pictures Test initially administered. Subjects scoring above and below median are assigned to "high-repressor" and "low-repressor" groups. Members of these groups randomly assigned to eight experimental conditions (in an analysis of variance design), each of which involves conditioning, through verbal approval, hostile vs. neutral content by aggressive or neutral adults. Chi-square tests used to test hypotheses relevant to asthma.

Duration: September 1962-June 1964.
Investigator(s): Ralph Epstein, Ph.D., Department of Psychology, Wayne State University, Detroit 2, Mich. (Reported by Kenneth Purcell, Ph.D., Chief, Psychological Research, Children's Asthma Research Institute and Hospital, Denver 4, Colo.).
Publication: Journal publication is planned.

17-L-9 STUDY OF FACTORS INFLUENCING EGO DEVELOPMENT IN PRIMITIVE CHILDREN

Purpose: To determine which factors promote and which deter development of ego functions in psychotic, deprived, or organically defective children while in the hospital.
Subjects: Primitive children on inpatient service, Children's Psychiatric Hospital, thought to have either functional or organic etiology for their primitiveness.
Methods: Daily logs of psychotherapy, nursing, occupational therapy, recreational therapy, special education including nursery school, and individual instruction employed to study events surrounding child's progress or regress in the hospital. Low judgment items on check lists used several times each day by objective observers as rating scales to provide a quantitative measure of changes in behavior.
Findings: The more investment provided by the staff to the child, the greater is his improvement. Having higher expectations of the child, even if this means actually frustrating his efforts to obtain primitive gratification, has provided considerable improvement in ego functioning, though this may produce occasional transient catatonic-like reactions in the child.
Duration: 1960-indefinite.
Investigator(s): John P. Kemph, M.D., Assistant Professor and Director of Inpatient Service, Children's Psychiatric Hospital, University of Michigan, Ann Arbor, Mich.
Publication: American Journal of Psychiatry, 119:10:934-939, April 1963.

17-L-10 FREE OPERANT CONTROL OF AUDITORY STIMULATION IN AUTISTIC CHILDREN

Purpose: To study factors affecting response to environmental stimulation in autistic children.
Subjects: Psychotic children with marked autistic tendency.
Methods: Operant conditioning using auditory stimuli.
Findings: None expected for one year.
Duration: February 1963-March 1964.
Investigator(s): J. Richard Metz, Ph.D., Clinical Psychologist II, Children's Unit, Camarillo State Hospital, Camarillo, Calif.
Cooperating group(s): California State Department of Mental Hygiene.

17-L-11 COMPARISON OF ULCERATIVE COLITIS AND ENCOPRETIC CHILDREN WITH REGARD TO THEIR PERSONALITY DYNAMICS AS REVEALED ON PROJECTIVE TESTING

Purpose: To determine what differences in psychic organization occur between these two groups of patients.
Subjects: 25 children from each group.
Methods: Analysis of Rorschach and TAT results.
Duration: 1964-1965.
Investigator(s): Bettie Arthur, Ph.D., Instructor in Psychiatry, School of Medicine, University of Michigan, Ann Arbor, Mich.
Publication: To be submitted for publication.

17-L-12 THE EMOTIONALLY DISTURBED CHILD WITH A CONVULSIVE DISORDER

Purpose: To determine the relationship between abnormal brain activity, emotional disturbance, and behavior.
Subjects: Emotionally disturbed children under 18 years referred to Children's Psychiatric Hospital, showing some evidence of organic brain deficit or convulsive disorder.
Methods: Simultaneous recordings during control periods and tape recording of psychiatric interviews of electroencephalogram, galvanic skin response, electrocardiogram, and respiration. This data combined with detailed notes of child's behavior in various situations and the psychopathology as gleaned from clinical interviews and psychological examinations.
Findings: In cases where a relationship between convulsive disorder and emotional disorder can be established (these cases are few), each case must be studied individually because of the wide variation of individual interrelationships between these two disorders. Often abnormal brain waves are reduced in amplitude and frequency by anger or excitement.
Duration: 1960-indefinite.
Investigator(s): John P. Kemph, M.D., Assistant Professor and Director, Inpatient Service, Children's Psychiatric Hospital, University of Michigan, Ann Arbor, Mich.
Publication: Psychosomatic Medicine 15:5:441-449, September-October 1963. "Effects of Psychiatric Interview Upon Paroxysmal Cerebral Activity and Autonomic Measures in a Disturbed Child With Petit Mal Epilepsy," Psychosomatic Medicine, in press. Further data will be reported in Psychosomatic Medicine.

17-L-13 SYMBOLISM AND THOUGHT PROCESSES IN LEARNING INHIBITIONS

Purpose: Investigation of thought processes of intelligent children showing a neurotic inhibition in school learning in early school grades.
Subjects: Children with learning inhibitions, aged 6.5 to 9.5 years. Two comparison groups: a school phobic group without learning problems and a normally achieving group without clinical symptoms.
Methods: Problem of perceptual distortion in reading and writing investigated by constructs that involve both Piaget's formulations about symbolic thought and psychoanalytic theories of impulse and defense. Investigation of processes involved in children's errors in academic work, children's ideas of physical and interpersonal causality, and conditions inducing regression in thought processes.
Duration: 1962-1965.
Investigator(s): George E. Gardner, M.D., Ph.D., Director, Bessie Sperry, Ph.D., Chief Psychologist, and Nancy Staver, M.S.S., Psychiatric Social Worker, Judge Baker Guidance Center, 295 Longwood Ave., Boston 15, Mass.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-L-14 THERAPEUTIC PROCESS IN GROUP PSYCHOTHERAPY

Purpose: (1) General aim is to study processes which facilitate or retard personality change during group psychotherapy, with emphasis on kinds of group psychotherapy experiences that lead to constructive change in the mentally ill person and the juvenile delinquent; and (2) to evaluate the generality of such therapeutic changes by simultaneously investigating institutionalized mental patients, institutionalized juvenile delinquents, and mentally ill persons seen in an outpatient psychiatry department. Focus is upon relationship between processes internal to psychotherapy interactions and between these processes and differential constructive personality change.

BEST COPY AVAILABLE

Duration: 1961-1965.
Investigator(s): Carl R. Rogers, Ph.D., Professor of Psychology and Psychiatry, and Charles B. Truax, Ph.D., Psychiatric Institute, University of Wisconsin, Madison 6, Wis. (Reported in *Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency*, Winter 1962-63.)
Cooperating group(s): Psychiatric Institute, University of Wisconsin.

17-L-15 PATTERNS OF ACTIVITY IN GROUPS OF DISTURBED CHILDREN ATTENDING THE CASEWORK OFFICE OF THE SINGAPORE CHILDREN'S SOCIETY

Purpose: To investigate: (1) whether personal and family background factors are causally related to present behavior patterns of subjects; (2) nature of subjects' response to such group activity opportunity as is provided; and (3) respective contributions of the group worker and family caseworker in "special provision" of this nature.
Duration: 1961-1962.
Investigator(s): C. S. Lee (D.S.W. Candidate, University of Singapore), Sekolah Laki 2, Sungei Besi, Federation of Malaysia. (Reported in *Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency*, Summer 1963.)
Cooperating group(s): Singapore Children's Society.

17-L-16 TRANSFERENCE AND COUNTER-TRANSFERENCE EXPERIENCES OCCURRING BETWEEN HOSPITALIZED EMOTIONALLY DISTURBED CHILDREN AND WARD PERSONNEL

Purpose: To determine the nature and kind of emotional problems arising among staff who deal with disturbed children in an inpatient setting.
Subjects: All ward personnel at Children's Psychiatric Hospital, Ann Arbor, Michigan.
Methods: Questionnaire dealing with both a positive and a negative experience occurring within two months immediately preceding date of administration of questionnaire.
Duration: 1964.
Investigator(s): Bettie Arthur, Ph.D., Instructor in Psychiatry, and John P. Kemph, M.D., Assistant Professor and Director, Inpatient Service, Children's Psychiatric Hospital, University of Michigan, Ann Arbor, Mich.
Publication: To be submitted for publication.

17-L-17 PROJECT EDC (EMOTIONALLY DISTURBED CHILDREN)

Purpose: To strengthen and develop services for children with emotional disturbances in San Francisco. One phase of project will include a survey of needs and resources for the care of emotionally disturbed children, aimed at providing a basis for recommendations for social planning and community action in this field.
Methods: Analysis of demographic data, literature, and of previous studies. Interviews with professional community resources personnel, meetings with representatives from various community service agencies (psychiatric clinics, child-care agencies, etc.), compilation of service statistics with assistance from California State Department of Mental Hygiene, observation of programs, and study of agency reports.
Duration: December 1962-February 1964.
Investigator(s): Irving Babow, Ph.D., Research Consultant, United Community Fund of San Francisco, 2015 Steiner St., San Francisco, and Lecturer in Social Welfare, University of California, Berkeley 4, Calif.

Cooperating group(s): San Francisco Foundation; Rosenberg Foundation. Publication: Report will be available from United Community Fund of San Francisco. Article for journal is anticipated.

17-L-18 THE EFFECTIVENESS OF RESIDENTIAL THERAPY WITH CHILDREN

Purpose: A study of the outcome and process of residential psychotherapy. Subjects: Present and former residents of a specific residential treatment center. Methods: Three stages: (1) collecting and organizing file data; contacting for follow-up study; (2) follow-up and outcome evaluation of present behavior in light of past treatment experience; and (3) process of residential therapy. Investigator(s): Stanley I. Berger, Ph.D., Assistant Professor of Psychology, University of New Hampshire, Durham, N. H.

17-L-19 PSYCHO-SOCIAL REPLICATION IN RESIDENTIAL TREATMENT

Purpose: To improve methods for assessing psycho-social replication. The project also has an important treatment component, since there are strongly suggested ties between replication, treatment technique, and outcome. Subjects: 10 cases selected from the children awaiting admission to Linden Hill School, a residential treatment center for disturbed adolescents. Methods: Cases will be studied in the family setting by a series of instruments which test the interpersonal action, perceptual, and affective components of the response pattern evoked by the child. Following this, contingency predictions will be made as to replicative possibilities in the institution and the same measures reapplied after the child has been in the treatment center. Duration: Not reported-1966. Investigator(s): Donald A. Bloch, M.D., Director of Research, Jewish Board of Guardians, 120 W. 57th St., New York 19, N. Y.; Robert A. Rosenthal, Ph.D., Research Psychologist, and Theodore Cherbuliez, M.D., Acting Clinical Director, Linden Hill School, Jewish Board of Guardians, Hawthorne, N. Y. Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-L-20 A SOCIOMETRIC STUDY OF THE CONGRUENCE OF WARD STAFF'S PERCEPTION AND THE ACTUAL STRUCTURE OF AN INPATIENT CHILDREN'S HOSPITAL SETTING

Purpose: To determine the accuracy with which nursing staff, psychiatric aides, and attendants perceive the interpersonal choice-rejection patterns of children on inpatient wards. Subjects: 65 ward personnel and 48 inpatients. Methods: (1) Sociometric choices and rejections made by children; and (2) some information filled out for each child by each staff member. Findings: In general, the staff shows a high degree of reliability and dependability in their assessment of ward structure. Duration: October 1962-fall 1964. Investigator(s): Bettie Arthur, Ph.D., Instructor in Psychiatry, School of Medicine, University of Michigan, Ann Arbor, Mich. Publication: To be submitted for publication.

Delinquency

Note: Some studies appearing in this section were selected from Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency published by the National Council on Crime and Delinquency in New York. Studies thus obtained are noted: (Reported by NCCD.)

17-M-1 POSITIONAL AUTHORITY AND DELINQUENT BEHAVIOR

Purpose: (1) To identify and describe conflicting definitions of roles of police, probation and parole officers (including social workers), teachers, mothers and fathers in preventing juvenile delinquency and treating those who are known to have committed delinquent acts; (2) to attempt to answer questions of relevance to problems of inter-agency conflict, training programs for professional and lay persons concerned with the problem of delinquency.
Subjects: Approximately 1,000 subjects, drawn equally from the populations occupying each role who are known to have direct contact with juvenile delinquents. The study will be carried out in eight southern California Counties (excluding Los Angeles).
Methods: All of the data will be collected in structured, individual interviews. Incumbents of each of these roles will be asked role definition questions (expectations and behavior) about their own and others' roles. In addition, differences in the perception of delinquency causation for three ethnic and three socio-economic groups will be assessed, as well as opinions with respect to the functional responsibilities of each of the five roles investigated for prevention, treatment and apprehension of delinquents.
Duration: June 1963-November 1964.
Investigator(s): Alexander W. McEachern, M.A., Project Head, Youth Studies Center and Visiting Associate Professor, School of Public Administration, University of Southern California, Los Angeles, Calif. 90007.
Cooperating group(s): County probation departments, police agencies, and school systems in Imperial, Kern, Orange, Riverside, San Bernardino, San Diego, Santa Barbara, and Ventura Counties, California; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Planned in correctional, sociological and psychological journals.

17-M-2 A STUDY OF THE INCIDENCE OF CRIMINALITY AMONG TWINS IN DENMARK

Purpose: To explore interaction between hereditary and environmental factors in the genesis of criminality. To describe twin's development from a social viewpoint, and to explore its significance with respect to their criminal careers.
Subjects: The Institute of Human Genetics has recorded all births of twins in the Danish islands in the period 1870-1910. In Jutland, the Danish peninsula, a similar registration is now being prepared for the years 1870-1920. Study will examine data on twins from the islands for years 1880-1910, and later data on twins from Jutland for period 1880-1920. It is expected that true criminality will be found in approximately 650 individuals.
Methods: Information from Central Police records and criminal records and documentary data are being utilized with respect to 200 individuals having more pronounced criminal careers. Interviews, tests, and psychiatric examinations with subjects.
Investigator(s): Professor Karl O. Christiansen, Assistant Director, Institute of Criminal Science, University of Copenhagen, Copenhagen, Denmark. (Reported by NCCD.)
Cooperating group(s): Institute of Human Genetics.

17-M-3 DEPRIVATION, ALIENATION AND DELINQUENCY IN WASHINGTON, D. C.

Subjects: All youth referred to Washington, D. C. Juvenile Court between July 1959 and March 1962.
Methods: Analysis of subjects in terms of their residential address by socioeconomic areas and racial areas. Simple, partial and multiple correlations computed for census tract analysis. Family data also included. White, mixed and nonwhite neighborhoods analyzed holding SES constant.
Duration: February 1963-February 1964.
Investigator(s): Charles V. Willie, Ph.D., Roy R. Jones, Sulochana Glazer, Anita Gershenovitz, and Myrna Levine, Juvenile Delinquency Planning Board, United Planning Organization, 1420 New York Ave., N. W., Washington 5, D. C. (Reported by NCCD.)
Cooperating group(s): President's Committee on Juvenile Delinquency and Youth Crime.
Publication: "Antisocial Behavior Among Culturally Deprived Youth: Some Observations on Prevention for Teachers," Journal of Negro Education.

17-M-4 RESEARCH PROJECT ON YOUTH PROBLEMS AND JUVENILE DELINQUENCY

Purpose: To investigate problems causing juvenile delinquency; to propose recommendations to cope with and prevent these social problems. To study problems of 60,000 high school students, including 300 intensive case studies.
Duration: March 1961-March 1963.
Investigator(s): Dr. Prasop Ratanakorn, Director, Prasat Neurological Hospital, Bangkok, Thailand. (Reported by NCCD.)
Cooperating group(s): National Research Council of Thailand; Thailand Police Department; Thailand Ministry of Education; Thailand Juvenile Court.

17-M-5 CASE ANALYSIS OF DELINQUENT BOYS RECEIVED BY PETITION AT ALLEGHENY COUNTY JUVENILE COURT DURING 1961

Purpose: To determine basic factors in subject's delinquency, and to what extent being out of school and out of work was characteristic of this group.
Subjects: 165 delinquent boys, 16 to 18 years old, received by petition at Allegheny County Juvenile Court during 1961.
Duration: 1962-1963.
Investigator(s): Patricia Slivinski, and Mabel A. Elliott, Ph.D., Chatham College, Pittsburgh, Pa. (Reported by NCCD.)
Cooperating group(s): Allegheny County Juvenile Court; Chatham College.

17-M-6 JUVENILE DELINQUENTS: THE SUCCESS IMAGE, SELF-IMAGE, AND THE PERCEPTION OF NORMS

Subjects: 90 white juveniles (30 nondelinquents, 30 noninstitutionalized, and 30 institutionalized delinquents).
Methods: Questionnaire with following sections: (1) attitudes toward police, law, property; (2) 4 sets of items measuring respectively prosocial, antisocial, asocial, and pseudo-social attitudes; (3) a set of 37 items responded to in terms of being part of a set of personal success criteria and perceived public success criteria; (4) a set of 37 techniques or attributes that might be important in becoming a success, successively responded to in terms of normative "ought to be relied on," "public does rely on," and "I will rely on;" and (5) a set of 37 skills or attributes responded to in terms of degree

of possession by the respondent.
Duration: July 1960-June 1963.
Investigator(s): Thomas W. Steinburn, Department of Sociology and Anthropology, Western Washington College, Bellingham, Wash. (Reported by NCCD.)
Cooperating group(s): Ford Foundation; University of Washington.

17-M-7 EXAMINATION OF ATTITUDES, VALUES AND BEHAVIOR OF YOUNG ADOLESCENTS WHO HAVE SUBSEQUENTLY BECOME DELINQUENTS, COMPARED WITH A MATCHED CONTROL GROUP

Purpose: To examine how far, prior to becoming delinquent, the young adolescent's outlook, values, attitude toward school, toward the future, relationship to parents, and image of himself differed from those of peers of the same age, sex, I.Q., and social class who did not become delinquent.
Subjects: 600 middle and working class men from the greater London area who participated ten years ago, at the age of 13, in a study of attitudes, values, etc.
Methods: Subjects reinterviewed. Those subsequently on probation or institutionalized questioned on effect of these experiences. A subsidiary study examines the values, outlook, and attitudes at age 13, of those who subsequently become policemen, and compares them with those of a group of delinquents and a group with jobs unrelated to the law in any way.
Duration: 1961-1963.
Investigator(s): Dr. H. Himmelweit, Reader in Psychology, London School of Economics, London, England. (Reported by NCCD.)
Cooperating group(s): Home Office.

17-M-8 THE RELATIONSHIP OF DELINQUENT SELF-CONCEPTION TO ADJUDICATION FOR DELINQUENCY

Purpose: To determine to what extent adjudication for delinquency (in this case appearance before the juvenile court for the first time) is related to the appearance of a delinquent self-concept.
Subjects: (1) Delinquent subjects--boys appearing in the Dane County Juvenile Court for the first time; (2) controls--boys in Dane County schools who are matched with the delinquent subjects in regard to social characteristics and the type of delinquent acts committed, but have not been adjudicated delinquent.
Methods: Study design involves a before and after, longitudinal type inquiry. Delinquent subjects are required to fill out a questionnaire measuring self-concept before adjudication and approximately one month afterward. Control subjects fill out questionnaires at two different times during a comparable time period. Data thus obtained allow assessment of change in self-concept by comparing the before and after measures for each group.
Duration: February 1962-June 1963.
Investigator(s): Virginia Lambert, Ph.D. Candidate, Department of Sociology, University of Wisconsin, Madison, Wis.
Cooperating group(s): Dane County Juvenile Court.

17-M-9 STUDY OF SELF- AND IDEAL SELF-CONCEPTS OF A SMALL GROUP OF INSTITUTIONALIZED GIRLS

Purpose: To test hypotheses that: (1) there will be a low positive or a negative correlation between self- and ideal self-concepts of subjects; (2) self-concepts of subjects are significantly negative or disapproving;

and (3) ideal self-concepts of subjects are significantly positive or approving.
Subjects: Accidental sample of approximately 20 girls in a State institution.
Methods: Administration of a 60-item Q-sort. Correlations between each self- and ideal-self sort will be calculated. An approval-disapproval index will be constructed in order to assign each sort an approval or disapproval rating.
Duration: 1962-February 1963.
Investigator(s): Joanne W. Sterling, Counselor, Girls' Welfare Home, Box 6038, Station B, Albuquerque, N. Mex. (Reported by NCCD.)

17-M-10 PERSONALITY AND SYMPTOMS IN PREADOLESCENT DELINQUENCY

Purpose: To differentiate between the impulse-ridden character disorder and the schizophrenic juvenile delinquent in terms of personality structure, family dynamics, socio-economic factors, and treatment implications.
Subjects: 20 larceny and 20 firesetting delinquent boys under 12 years of age, committed to the Division of Youth Service; latency girls under age 17 who set fires, commit crimes of violence, or commit incest.
Investigator(s): Irving Kaufman, M.D., Research Associate, and research staff, Tufts University, Medford 55, Mass. (Reported by NCCD.)

17-M-11 AGGRESSION IN CHILDREN

Purpose: To discover whether there are, as is widely believed, different types of aggression, and whether people tend to specialize in one or another type.
Subjects: Institutionalized delinquents and third grade boys and girls.
Methods: Peer ratings, self-reports, ratings by adults.
Findings: With measures used and subjects tested, there is little or no tendency for children to specialize in one or another type of aggression, such as verbal, physical, direct, or inquisitive.
Duration: Fall 1961-summer 1962.
Investigator(s): Jerome Laulicht, Ph.D., Canadian Peace Research Institute, Clarkson, Ont. (Formerly Research Director, Berkshire Farm for Boys, Canaan, N. Y.). (Reported by NCCD.)
Cooperating group(s): Berkshire Farm for Boys.

17-M-12 FAMILY RELATIONS AND CRIMINAL ACTING OUT

Purpose: Earlier studies have focused on relationships within families which produce only one habitual criminal--the black sheep. The present study deals with family relationships within families which produce many delinquent and criminal sons.
Subjects: Groups of criminal brothers who are serving sentences at the same time; their nondelinquent family members.
Duration: Continuing.
Investigator(s): Dr. Bruno M. Cormier, Miriam Kennedy, Anton Obert, Jadwiga Sangowicz, and Andre Thiffault, Department of Psychiatry, McGill University, Montreal, Que. (Reported by NCCD.)
Cooperating group(s): Dominion-Provincial Grant.
Publication: Canadian Journal of Corrections 1:4:50-55, July 1959; 3:1:18-37, January 1961; 3:4:456-462, October 1961.

17-M-13 AN EXAMINATION OF SOME SUBCULTURAL ASPECTS OF DELINQUENCY

Purpose: To test hypothesis that there are delinquent subcultures in selected areas in Nottingham where delinquency is not regarded as such, and may actually be encouraged.
Subjects: 350 to 500 households in each of two areas of Nottingham, one having history of high delinquency and one with low delinquency. Within the areas, study sections are selected on basis of close geographical proximity but disparate delinquency records.
Methods: Tape recordings are made of semi-structured interviews with subjects. Unit of analysis is the household rather than any particular respondent.
Duration: January 1960-July 1963.
Investigator(s): Dr. A. R. Emerson, W. J. H. Sprott, and D. C. Marsh, Department of Social Science, University of Nottingham, University Park, Nottingham, England. (Reported by NCCD.)
Cooperating group(s): University of Nottingham; Home Office.

17-M-14 THIRTEEN FIGHTING BOYS: A STUDY OF SOCIO-CULTURAL FACTORS INFLUENCING ASSAULTIVE BEHAVIOR

Purpose: To explore and determine socio-cultural factors influencing assaultive behavior; to relate these factors to the adolescent's attitude toward school, his peers, and being a member of a multiproblem family.
Subjects: 13 boys residing in census tract areas 44, 56, and 79 of San Antonio, Texas, who committed an assaultive offense and were referred to the Bexar County Juvenile Office in 1961.
Methods: Analysis of data obtained from the following sources: Bexar County Juvenile Department, Central Index, nine social welfare agencies, and ten public schools. Eleven of the boys were individually interviewed.
Duration: August 1962-May 1963.
Investigator(s): Daniel H. Saucedo, Martin Sundel, Robert Bonovich, Louis Tomaino; and Sister M. Immaculate, Director, Worden School of Social Service, Our Lady of the Lake College, San Antonio 7, Tex. (Reported by NCCD.)
Cooperating group(s): Bexar County Juvenile Department.

17-M-15 DELINQUENT YOUTH AND PUNITIVE COMMUNITIES: A STUDY OF THE BIPOLARIZATION PROCESS IN SERIOUS GROUP DELINQUENCY

Purpose: In a heterogeneous community with ambiguous values and differential access to power, sanctions against the less powerful may be used to clarify and defend the value system of the more powerful. If a subset of the rejected challenges the system by deliberate counter-norm behavior, a cycle of increasing sanctions and increasing resistance may begin. Aim of this project is to study methods for breaking this cycle, considering both the delinquent youth and the punitive community.
Subjects: Four urban areas of high and low delinquency rates: San Juan, Santurce, Rio Piedras, and Ponce. San Juan and Santurce will serve as control communities.
Methods: Pilot studies employ street worker, participant observer, and household survey techniques. Further pilot studies are planned leading eventually to a test period of suspension of all sentences to reform schools for youths from the experimental communities. Small group experiments are being used to duplicate community processes in a laboratory setting.
Duration: July 1962-July 1963 (pilot phase).
Investigator(s): Howard R. Stanton, Director, Social Science Program, and staff, Insular Department of Health, San Juan, P. R. (Reported by NCCD.)
Cooperating group(s): Puerto Rico Children's Commission; Russell Sage Foundation.

17-M-16 STUDY OF THE ADOLESCENT GIRL IN CONFLICT

Purpose: To better understand the disturbed and delinquent girl in the North American culture; to improve practice and programs trying to help the girl in conflict.
Subjects: Emotionally disturbed or adjudicated delinquent girls in institutional placement, and (later) girls in the community.
Methods: Tape recorded interviews, diaries or letters, if available, and group discussions. Social group work method singled out for special attention and evaluation.
Duration: 1962-continuing.
Investigator(s): Gisela Konopka, D.S.W., Professor of Social Work, University of Minnesota, Minneapolis 14, Minn. (Reported by NCCD.)
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Children 11:1:21-26, January-February 1964.

17-M-17 A STUDY OF THE FEMALE YOUTHFUL OFFENDER IN NEW YORK CITY

Purpose: To collect and study data on a selected population of female youthful offenders and to delineate in detail the characteristics of the group; to compare psychiatric with nonpsychiatric offenders; to do a follow-up study on samples of all types of offenders, determining rates of recidivism and other pertinent factors.
Subjects: Selected from 5862 cases of female youthful offenders, 37% of whom were examined in the Psychiatric Division of Bellevue Hospital.
Investigator(s): Arthur Zitrin, M.D., and Andrew K. Bernath, Psychiatric Division, Bellevue Hospital, First Ave. and 27th St., New York, N. Y. (Reported by NCCD.)
Cooperating group(s): New York University Medical Center.

17-M-18 NATURE AND ROLES OF FEMALE DELINQUENT GANGS

Purpose: (1) To investigate the roles of female gang members in the delinquent behaviors of associated male gangs; (2) to investigate social, developmental, personality and behavioral characteristics of female gang members; and (3) to investigate history and structure of female gangs.
Subjects: 125 or more members of female delinquent groups, associated with four large Negro male gangs already under study in Los Angeles.
Methods: In cooperation with detached workers assigned by the Los Angeles County Probation Department the study will include: observation; interviews; collection of police, court, probation, school and health records; comparisons with matched control girls.
Duration: September 1963-December 1965.
Investigator(s): Malcolm W. Klein, Ph.D., Project Head, Youth Studies Center, University of Southern California, Los Angeles, Calif. 90007.
Cooperating group(s): Los Angeles County Probation Department; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal articles and reports when and where appropriate.

17-M-19 YOUTHFUL DELINQUENT BEHAVIOR OF RESPECTABLE MEN

Purpose: To study, in retrospect, reports of the youthful behavior of responsible men which might very well have been labelled "delinquent."

BEST COPY AVAILABLE

Methods: Three geographical areas are under study: (1) Glen Cove on Long Island, a community of 24,000 persons representing a variety of socio-economic and ethnic backgrounds, was chosen for a five percent area probability sample of households; (2) in the north end of Boston, having predominantly Italian and Irish residents, 100 householders in an area probability sample will provide comparisons of experiences and opportunities to which similar ethnic groups were exposed in growing up in a crowded metropolitan working class district, in contrast to growing up in Glen Cove; and (3) in Baton Rouge, Louisiana, interviews with 50 clergymen and 50 lawyers will provide data on occupational differences with respect to delinquent behavior and attitudes toward misbehavior of today's youth. An extensive interview schedule permits an earlier and more definite involvement of respondent in recalling his youthful delinquent behavior and offering constructive suggestions for youth today. The Bureau of Social Research, Columbia University will assist in coding and processing data on IBM cards.
Duration: October 1961-September 1964.
Investigator(s): Sophia M. Robison, Ph.D., Director, Career Patterns Project, Adelphi University, Garden City, L. I., N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Report on exploratory phase of project will be available in late summer, 1964.

17-M-20 AN ACTION-RESEARCH PROJECT FOR THE PROVISION OF INFORMATION ON THE FORCES ACTING IN "STREET CORNER GROUPS"

Purpose: To determine social and economic background from which members of "street corner groups" derive; to identify their special needs, which contribute to formation of groups with asocial behavior and interfere with their integration into normal society.
Subjects: Youths, 14 to 18 years, belonging to "street corner groups."
Methods: Four detached group workers, assigned to "street corner group" environments, will attempt to join the groups and follow accepted rules of behavior. Later they will endeavor to guide the groups toward positive social behavior and an eventual transfer into accepted group settings.
Duration: October 1962-October 1965.
Investigator(s): Karl Frankenstein, Yona Cohn and Batia Mintal, and H. Kahn, Israel Ministry of Social Welfare, Jerusalem, Israel. (Reported by NCCD.)
Cooperating group(s): Tel-Aviv City Welfare Department; Hebrew University; Social Security Administration, U. S. Department of Health, Education, and Welfare.

17-M-21 FROM GANG VIOLENCE TO HEROIN USE AMONG STREET ADOLESCENTS

Purpose: To describe and explain the shift from gang violence to heroin addiction in delinquency occurring over a five year period (1956-1961) in the Yorkville section of Manhattan.
Methods: Secure and analyze cultural, social, and psychological data to identify sources of pressure and conflict related to individual predispositions toward violence and heroin addiction. Much data is already available through five years of participant observation in the project area. Theory of "Adaptational Psychodynamics" used as framework for analyzing data.
Duration: 1962-continuing.
Investigator(s): Edward Preble, Professor, New York School of Psychiatry, 600 East 125 St., New York, N. Y. (Reported by NCCD.)
Cooperating group(s): New York School of Psychiatry; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-M-22 ETIOLOGY OF NARCOTIC INVOLVEMENT IN YOUTH AUTHORITY WARDS

Purpose: To explore manner in which narcotic-involved Youth Authority wards become introduced to illegal drug use. To investigate personal and social correlates of continued drug involvement.
Subjects: Selected wards from Preston School of Industry.
Methods: Names of wards entering Preston with histories of prior narcotic involvement are provided by classification staff. Wards are screened for suitability as candidates for a series of panel or sequential interviews. Selected subjects are interviewed periodically to establish rapport and obtain life histories, with emphasis on introduction to and involvement with narcotics. Interviews tape recorded for later transcription and analysis.
Duration: 1961-continuing.
Investigator(s): Dorothy Zietz, Ph.D., and Keith S. Griffiths, Ph.D., Chief, Research Division, California Department of Youth Authority, 401 State Office Bldg. No. 1, Sacramento 14, Calif. (Reported by NCCD.)
Cooperating group(s): California Department of Youth Authority.
Publication: Adams, S. and Zietz, D., Patterns of Narcotic Involvement: The Autobiographies of Five Juvenile Offenders, Research Report No. 28, Department of Youth Authority, February 1962.

17-M-23 EVALUATION RESEARCH OF POST-INSTITUTIONAL PERFORMANCE OF DISCHARGEES FROM ADOLESCENT AND ADULT NARCOTICS ADDICTION WARDS OF METROPOLITAN HOSPITAL

Purpose: To study continuities and discontinuities in the process of patient care for narcotic addicts in a hospital ward service.
Subjects: 250 patients randomly selected from hospital admissions over the course of a year; sample of staff on narcotics service.
Methods: Patients interviewed once upon admission, once during hospitalization, and once after discharge; interviews with sample of professional and nonprofessional staff on the narcotics service. Participant observations conducted of patients and staff.
Findings: Patients vary widely in degree of conventionality; four different life style adaptations observed consisting of conventional and criminal patterns of behavior; staff on narcotics service hold ambivalent attitudes towards addicts; an action research program on narcotics addiction seems well suited to the development of a program of medical education, research, and service in community psychiatry.
Duration: July 1961-June 1964.
Investigator(s): Richard Brotman, Ph.D., Director, Division of Community Mental Health, Department of Psychiatry, New York Medical College, New York, N. Y.
Cooperating group(s): Health Research Council.

17-M-24 SEXUAL DELINQUENCY IN GIRLS

Purpose: Hypothesis: Bio-psychological or socio-cultural precocity favors delinquent sexual patterns in girls.
Subjects: 50 sexually delinquent girls; smaller control group of nonsexually delinquent girls.
Methods: Search for biological and sociological components of precocity in both groups, using official records as main source. Psychological testing (Murray, Rorschach, Porteus Maze, I.Q.) used to integrate the data in a clinical approach. Interviewing techniques will then be designed.
Duration: October 1961-1964.
Investigator(s): Jean Constant, Guy Houchon, Suzanne Moreau, G. Goosens, and M. Beyers, Ecole de Criminologie, Universite de Liege, rue Ch. Magnette 2,

app. 4c, Liege, Belgioque. (Reported by NCCD.)
Cooperating group(s): Schools of Law and Criminology, University of Liege; Foundation for the Protection of Children (Establissement de la Protection de l'Enfance).

17-M-25 STUDY OF CAR THEFTS BY JUVENILES

Subjects: Juveniles sentenced to St. John's Training School for car stealing.
Methods: Interviews with subjects; collection of data from files of Juvenile and Family Court, Toronto. Statistical evaluation of data. Factors relating to subjects' familial background, educational and socio-economic level, and personal history will be investigated.
Duration: December 1962-July 1963.
Investigator(s): M. D. Tutchie, M.D., Director, and J. W. Mohr, Forensic In-Patient Unit, Toronto Psychiatric Hospital, 2 Surrey Place, Toronto, Ont. (Reported by NCCD).
Cooperating group(s): St. John's Training School.

17-M-26 A MULTIDISCIPLINARY COMPARISON OF JUVENILE AUTO THIEVES AND JUVENILE BURGLARS

Purpose: To uncover any systematic differences between juvenile auto thieves and other juvenile thieves.
Subjects: First offenders coming before the court in a district of the greater Boston area.
Methods: Structured interviews, questionnaires, and psychological tests used to systematically explore such factors as school adjustment, family organization, personality dynamics, birth order, and juvenile's value-attitude orientation.
Duration: March 1962-continuing.
Investigator(s): William R. Shelton, M.D., Gene Bocknek, George W. Rever, Dorothy F. Rowell, M.S.W., Probation Officer, and Ruth S. Stone, Probation Officer, Cambridge Court Clinic, Third and Spring St., Cambridge 41, Mass. (Reported by NCCD.)
Cooperating group(s): Boston University Law-Medicine Research Unit; East Cambridge 3rd District Court.

17-M-27 THE MEASUREMENT OF DELINQUENCY

Purpose: To devise an index or indices to juvenile delinquency that can be used to measure changes in such delinquency and the effectiveness of preventive programs.
Subjects: 10 percent sample of all offenses committed by juveniles 7 to 17 years of age in Philadelphia during 1960 and known to the police.
Duration: September 1960-August 1963.
Investigator(s): Thorsten Sellin, Ph.D., Professor of Sociology, and Marvin E. Wolfgang, Ph.D., Associate Professor of Sociology, University of Pennsylvania, Philadelphia 4, Pa. (Reported by NCCD.)
Cooperating group(s): Ford Foundation.

17-M-28 FACE VALIDITY IN THE Pd SCALE OF THE MINNESOTA MULTI-PHASIC PERSONALITY INVENTORY

Purpose: To determine whether items on the Pd scale of the MMPI rated *a priori* as "face valid" differentiate clinically defined psychopathy among delinquent boys better than items rated *a priori* as "congruent" and "irrelevant", and whether the "congruent" items differentiate psychopathy better than the "irrelevant" items.
Subjects: Two groups of delinquents clinically classified as psychopathic and nonpsychopathic on the basis of Cleckly's (1959) diagnostic criteria.
Methods: MMPI administered to subjects. Cleckly's diagnostic criteria used to classify items of the Pd scale *a priori* as (1) face valid, (2) congruent or consistent with psychopathy, and (3) irrelevant or inconsistent with psychopathy.
Duration: June 1961-continuing.
Investigator(s): Jo Anne H. DeHaven, Psychiatric Clinic, Hamilton County Juvenile Court, 2020 Auburn Ave., Cincinnati 19, Ohio. (Reported by NCCD.)
Cooperating group(s): Hamilton County Juvenile Court; Glenview School.

17-M-29 RELATIONSHIP BETWEEN RECIDIVISM AND VARIOUS ATTITUDES AND BEHAVIORS

Purpose: To determine which of the independent variables in the study (e.g., aggression, anomie, attitude toward authority, sociometric status, etc.) relate to recidivism.
Subjects: 140 boys at Berkshire Farm.
Methods: Measure variety of attitudes and behaviors of subjects. Follow-up for one year after discharge from Berkshire Farm to determine whether or not they were arrested, convicted of crime, or recommitted to correctional facilities.
Duration: Fall 1961-summer 1962.
Investigator(s): Jerome Laulicht, Ph.D., Project Director, Canadian Peace Research Institute, Clarkson, Ont. (formerly Research Director, Berkshire Farm for Boys, Canaan, N. Y.) (Reported by NCCD.)
Cooperating group(s): Berkshire Farm for Boys.

17-M-30 RECIDIVISM AND BEHAVIOR DURING COMMITMENT TO A TRAINING SCHOOL

Purpose: To test hypothesis that there is no relationship between behavioral adjustment in a training school environment and recidivism after discharge.
Methods: Behavior is assessed in terms of number of runaways, number of conduct reports, and group honor roll status (a monthly summary measure of degree of "antisocial" behavior).
Duration: Summer 1961-summer 1962.
Investigator(s): Jerome Laulicht, Ph.D., Project Director, Canadian Peace Research Institute, Clarkson, Ont. (formerly Research Director, Berkshire Farm for Boys, Canaan, N. Y.) (Reported by NCCD.)
Cooperating group(s): Berkshire Farm for Boys.

17-M-31 CRIME PREVENTION AND PRIMARY SCHOOL CHILDREN

Purpose: To assess when and how the social inadaptation that may later result in delinquent behavior could be noticed in school children; to pave the way for preventive work with such children.
Subjects: 2,617 children, 8 to 9 years old, attending the second grade of

primary school in 1954-1955.
Methods: Follow-up of school results of subjects through 1960-1961 when they finished their schooling; visits to families on a sample basis by social workers; development of eventual troubles recorded by social welfare bodies and by police.
Duration: June 1962-December 1963.
Investigator(s): Dr. Bronislav Skaberne, Katja Vodopivec, Marijan Blejec, Vinko Skalar, and Boris Uderman, Institut za Kriminologijo pri Pravni fakulteti v Ljubljani, Trg revolucije st. 11, Jugoslavija. (Reported by NCCD.)
Cooperating group(s): Council for Education and Council for Social Welfare of the People's Republic of Slovenia; Boris Kidric Research Fund.

17-M-32 THE SCHOOL'S ROLE IN PREVENTING DELINQUENCY

Purpose: To reduce incidence of delinquency over a period of years.
Subjects: 13 year old boys and girls at an English comprehensive school.
Methods: Series of lessons on human relationship problems given to subjects once a week. Comparison is made of results with suitable control groups. Objective tests are in the process of being worked out.
Duration: 1962-continuing.
Investigator(s): Dr. R. G. Andry, Psychology Department, Institute of Education, University of London, London W. C. 1, England. (Reported by NCCD.)

17-M-33 JUVENILE DELINQUENCY FIELD DEMONSTRATION AND TRAINING PROJECT

Purpose: To test the concept that an approach to the solution of delinquency problems in suburban areas requires an effective combination of three basic kinds of child and family treatment services, namely: (1) casework services; (2) psychiatric and psychological clinical services; and (3) services which emphasize corrective and educational methods of treatment, i.e., group work, remedial education, on-the-job counseling, vocational guidance, etc.
Subjects: Three groups of 50 children each selected through application of predictive scales and clinical criteria. Groups will receive varying levels of treatment as follows: group (1), control; group (2), limited service; and group (3), full service group receiving services outlined above. Graduate students will be used in the training phase, as well as teachers, probation officers, and juvenile police officers.
Duration: September 1961-September 1967.
Investigator(s): George E. Gardner, M.D., Ph.D., Director, Elizabeth S. Makkay, M.D., and David Ricks, Ph.D., Research Psychologist, Judge Baker Guidance Center, 295 Longwood Ave., Boston 15, Mass; and Edward Landy, Ed.D., Assistant Superintendent, Newton Public Schools, Newton, Mass. (Reported by NCCD.)

17-M-34 PREDICTIVE UTILITY OF THE JUVENILE COURT PREHEARING REPORT: A FIVE YEAR FOLLOW-UP STUDY

Purpose: (1) To determine relative importance of various types of data used in making a disposition about a child in juvenile court; and (2) to study ability of making predictions by professional persons (probation officers, juvenile court judges, clinical psychologists) from the prehearing report concerning disposition, recidivism and social adjustment.
Subjects: Complete prehearing reports from Hennepin County Juvenile Court selected randomly for boys who were ages 16 or 17 in 1957 (N=30). Clinical

judges will be experienced probation officers, juvenile court judges, and clinical psychologists.
Methods: (1) Each boy in the sample who appeared in juvenile court in 1957 will be interviewed to obtain present adjustment data; (2) court records, probation reports and institutional reports will be used to ascertain disposition, recidivism and adjustment; (3) clinical judges will be asked to predict: court disposition in 1957, probation adjustment and violation, institutional adjustment, recidivism, military service adjustment, occupational adjustment, marital adjustment, community participation, recreation pursuits, personal problems, and need for psychotherapy. Predictions will be made for each section of prehearing report, and for entire report.
Duration: October 1962-August 1963.
Investigator(s): Seymour Z. Gross (Ph.D. Candidate), Clinical Psychologist, Hennepin County Mental Health Center, 619 S. 5th St., and Robert D. Wirt, Ph.D., Director, Center for Personality Research, University of Minnesota, Minneapolis, Minn.
Cooperating group(s): Hennepin County Court Services.

17-M-35 AN EVALUATION OF DETACHED WORK AS A METHOD OF REDIRECTING DELINQUENT STREET CORNER GROUPS

Purpose: To discover the degree of utility of detached workers in redirecting delinquent youths.
Subjects: 500 adolescents and 6 detached workers involved in Boston area detached work programs.
Methods: Administration of attitude scales including California Psychological Inventory, Who Am I test, and sociometrics of several types. Interviews with adolescents and detached workers. Compilation of complete record of delinquent activities of each boy as project proceeds.
Duration: October 1962-June 1964.
Investigator(s): Dr. Theodore N. Ferdinand, Assistant Professor, Department of Sociology and Anthropology, Northeastern University, Boston 15, Mass. (Reported by NCCD.)
Cooperating group(s): Boston YMCA; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-M-36 EFFECT OF A TRANQUILIZER UPON THE BEHAVIOR OF INSTITUTIONALIZED DELINQUENT BOYS

Subjects: 90 first admissions to the Wisconsin School for Boys, divided equally into three groups and matched for age, intelligence, and race.
Methods: Double blind technique. Group (1) received experimental drug for first six weeks, placebo for second six weeks, and no treatment during last six weeks. Group (2) received placebo for first six weeks, experimental drug for second six weeks, and no treatment during last six weeks. Group (3) received no treatment during entire 18 weeks.
Duration: 1959-1962.
Investigator(s): Asher R. Pacht, Ph.D., Chief Psychologist, Richard P. Youniss, Ph.D., William Peterson, Ph.D., George Messinger, and James E. Cowden, Psychiatric Services, Wisconsin Division of Corrections, 270 State Office Bldg., Madison, Wis. (Reported by NCCD.)

17-M-37 A COMPARISON OF CHARACTERISTICS OF INSTITUTIONALIZED NEGRO AND WHITE DELINQUENTS

Purpose: To compare Negro and white boys in terms of characteristics, family background, behavior while at institution, previous delinquency histories, etc.
Methods: Data collected from institution records; findings compared with those of at least one previous study by another investigator.
Duration: 1961-1962.
Investigator(s): Jerome Laulicht, Ph.D., Project Director, Canadian Peace Research Institute, Clarkson, Ont. (formerly Research Director, Berkshire Farm for Boys, Canaan, N. Y.) (Reported by NCCD.)
Cooperating group(s): Berkshire Farm for Boys.

17-M-38 EXPLORATORY STUDY OF POPULATION CHARACTERISTICS AT THE NATIONAL TRAINING SCHOOL FOR BOYS

Purpose: First of a proposed series of projects to investigate problems represented by boys aged 13 to 19 committed to National Training School for Boys, a Federal institution.
Subjects: 200 boys discharged from the school.
Methods: Collection, coding, and intercorrelation of approximately 250 bits of information on each boy. Information includes background, nature of offense, personality characteristics, and institutional adjustment. Later, attempts will be made to obtain follow-up data on same subjects.
Duration: July 1962-June 1963.
Investigator(s): F. Patrick McKegney, M.D., and Kenneth R. Strawberry, National Training School for Boys, Washington 13, D. C. (Reported by NCCD.)
Cooperating group(s): Federal Bureau of Prisons, U. S. Department of Justice.

17-M-39 PERSONALITY OF THE JUVENILE OFFENDER AS COMPARED TO THE OFFENSE HE COMMITS

Purpose: To determine if certain classes of offenders are more delinquency prone than others.
Subjects: 340 boys committed to Minnesota Juvenile Reception Center, October 1961 to July 1962.
Methods: Test for high delinquency proneness using a profile scored on the MMPI. Each boy classified according to offense upon commitment to the Center using the following offense classes: assault, sex crime, robbery, burglary, car theft, larceny, liquor offense, curfew offense, absenteeism, truancy, and incorrigibility; one category for those committing two or more crimes.
Duration: June 1962-April 1963.
Investigator(s): Charles L. Newman, M.P.A., Professor and Director, Frank Rossel, and Robert Fredell, Program of Correctional Training, Kent School of Social Work, University of Louisville, Louisville, Ky. (Reported by NCCD.)
Cooperating group(s): Minnesota State Department of Corrections.

17-M-40 TYE TYPOLOGY OF DELINQUENCY

Purpose: To discover whether there are any distinct characteristics that would typify a theif, an absconder, a sexual offender, etc.
Subjects: 957 boys admitted to State approved schools in Finland and investigated at the Jarvilinna Receiving Center between 1947 and 1956.
Duration: 1955-1962.
Investigator(s): Erkki Saari, Ph.D., Leppavesi, Finland. (Reported by NCCD.)
Cooperating group(s): School of Social Sciences, Tampere, Finland.

17-M-41 TYPOLOGY OF INSTITUTIONALIZED DELINQUENTS

Purpose: To validly classify delinquents and to attempt to draw implications for the best forms of treatment for each type.

Subjects: 140 boys at Berkshire Farm.

Methods: Measures of variety of attitudes and behaviors administered to subjects. Factor analyses used to reduce the large number of measures to meaningful clusters.

Duration: 1960-1962.

Investigator(s): Jerome Laulicht, Ph.D., Project Director, Canadian Peace Research Institute, Clarkson, Ont. (formerly Research Director, Berkshire Farm for Boys, Canaan, N. Y.) (Reported by NCCD.)

Cooperating group(s): Berkshire Farm for Boys.

17-M-42 DIAGNOSTIC TYPOLOGIES FOR DISTURBED DELINQUENT GIRLS IN A RESIDENTIAL TREATMENT CENTER

Purpose: To develop a diagnostic classification for use by social casework staff to assign youngsters more effectively to appropriate treatments.

Subjects: Approximately 200 girls from Las Palmas School for Girls, median age 16, primarily Caucasian with some Negroes and Mexican-Americans.

Methods: Psychological inventories, psychiatric and I-level diagnoses, clinical and social work interviews. Data processed by factor analysis, Q-analysis, and possibly latent class analysis in search for clusters or groupings that have more meaning for treatment assignment than existing classifications now in use at Las Palmas.

Duration: October 1963-October 1965.

Investigator(s): Stuart Adams, Ph.D., Research Director, and Edgar W. Butler, M.A., Research Analyst, Los Angeles County Probation Department, P. O. Box 4002, Terminal Annex, Los Angeles 54, Calif.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: Research reports will be released by the Research Office, Los Angeles County Probation Department.

17-M-43 SURVEY OF TYPES OF JUVENILE DELINQUENTS DIAGNOSED AT THE "MESILAH" OBSERVATION CENTER IN JERUSALEM

Subjects: 120 juvenile delinquents observed and diagnosed over a two year period.

Methods: Relationship between the following variables investigated by statistical analysis: (1) type of disturbance; (2) ethnic origin of delinquent; (3) age at immigration, if applicable; (4) sibling order; (5) size of family; (6) wave of immigration; and (7) socio-economic status of father.

Findings: Deep personality disorders were more frequent in higher socio-economic strata, regardless of ethnic groups, in accordance with research results in other countries. Significantly less deep personality disorders were found among juvenile delinquents from Arab countries. Significantly more deep personality disorders were found among subjects who immigrated at five years of age and below.

Duration: 1961-1962.

Investigator(s): Reuven Kohen-Raz. (Information supplied by Mrs. H. Kahn, Head, Foreign Relations Division, Ministry of Social Welfare, Jerusalem, Israel, and reported by NCCD).

Cooperating group(s): Ministries of Health and of Social Welfare.

17-M-44 DIFFERENTIAL SOCIALIZATION: THE DELINQUENT VERSUS THE NONDELINQUENT

Purpose: To examine several components of self held by institutionalized delinquents, lower class ninth graders, and middle class ninth graders. To test, in a limited way, validity of Cohen's as well as Cloward and Ohlin's contentions that delinquent boys, being of the working class, reject middle class values, and feel limited in opportunity.

Subjects: 515 boys at Boys' Industrial School, Lancaster, Ohio; 61 ninth grade boys in a lower class school, and 68 ninth grade boys in a middle class school, the latter two in Columbus, Ohio.

Methods: Instrument containing scales designed to measure socialization, self-concept, value orientation, and awareness of limited opportunity, was completed by subjects.

Duration: Not reported-August 1962.

Investigator(s): Frank R. Scarpitti, Ph.D., Director, Institute Treatment Center, 1158 South 3rd St., Louisville 3, Ky. (Reported by NCCD.)

Cooperating group(s): Ohio State University.

17-M-45 IDENTIFICATION OF INDIGENOUS LEADERSHIP OF INSTITUTIONALIZED DELINQUENT YOUTH, ITS ROLE AND INFLUENCE ON THE PEER GROUP

Purpose: To study indigenous peer group leaders of delinquent youth in institutions, and criteria for their selection; to measure strength of their importance in order to have more data on the possibility of reaching each individual member of the group by institution personnel; and to experiment with methods of utilizing such leadership for rehabilitative purposes.

Duration: 1963-continuing.

Investigator(s): Rachel Hutner and L. Jaffe. (Information supplied by Mrs. H. Kahn, Head, Foreign Relations Division, Ministry of Social Welfare, Jerusalem, Israel, and reported by NCCD).

Cooperating group(s): Ministry of Social Welfare; Hebrew University.

17-M-46 COTTAGE SIMILARITIES AND DIFFERENCES IN A TRAINING SCHOOL: DIFFERENCES IN BACKGROUND, CHARACTERISTICS AND BEHAVIOR OF BOYS IN VARIOUS COTTAGE UNITS

Purpose: It is hypothesized that there are significant differences among boys assigned to various cottages in one training school. However, it is expected that there are similarities among boys in several cottages, or "clusters" of cottages.

Methods: Data collected from institution records and questionnaires measuring various attitudes and behavior. Attempt will be made to assess relevance of any obtained differences to different recidivism rates of boys from various cottages.

Duration: Spring 1961-winter 1962.

Investigator(s): Jerome Laulicht, Ph.D., Project Director, Canadian Peace Research Institute, Clarkson, Ont. (formerly Research Director, Berkshire Farm for Boys, Canaan, N. Y.) (Reported by NCCD.)

Cooperating group(s): Berkshire Farm for Boys.

17-M-47 ADJUSTMENT, OBSERVED AND MEASURED, OF DELINQUENTS IN A SHORT-TERM TREATMENT INSTITUTION

Purpose: To determine whether there is a relationship between observed adjustment (staff evaluated) and measured adjustment, using the California

Test of Personality, Intermediate Series. To determine whether significant changes in personal and social adjustment (as measured by the California Test) could be effected during periods of institutionalization under nine months.
Subjects: 50 boys institutionalized from one day to seven months.
Methods: Boys given California Test and simultaneously evaluated by institutional staff. Process then repeated after a two-month interval.
Findings: No significant correlation between observed and measured adjustment. No significant difference between levels of adjustment of groups institutionalized for varying periods up to nine months. Conclusion: no significant change can be effected among most youngsters institutionalized for less than nine months.
Duration: June 1962-April 1963.
Investigator(s): Jerome M. Tashbook, 620 W. Ormsby Ave., Louisville 3, Ky. (Reported by NCCD.)
Cooperating group(s): Kent School of Social Work, University of Louisville; Youth Development Center, Canonsburg, Pa.; Office for Children and Youth, Commonwealth of Pennsylvania.

17-M-48 RELATIONSHIP OF PSYCHOSOCIAL VARIABLES TO INSTITUTIONAL AND POST-INSTITUTIONAL ADJUSTMENT

Purpose: To obtain norms on tests and ratings for boys passing through the Wisconsin School for Boys. To refine these scales and ratings to differentiate effectively among the youths. To determine predictive value of these tests and ratings with respect to each boy's institutional and post-release adjustment.
Methods: Determination of norms for a sample of boys on 35 "predictor" and 2 "criterion" variables. "Predictor" variables include age, I.Q., hostility, anxiety, guilt, dependency, degree of disturbance, identification, family relations, etc. "Criterion" variables are ratings of institutional and post-release adjustment.
Duration: September 1960-continuing.
Investigator(s): Asher R. Pacht, Ph.D., Chief Psychologist, Wisconsin Division of Corrections, 270 State Office Bldg., Madison, Wis.; James E. Cowden, Ph.D., and William Peterson, Ph.D., Senior Psychologist, Wisconsin School for Boys, Wales, Wis. (Reported by NCCD).

17-M-49 CLINTON COUNTY RETROSPECTIVE NEED STUDY

Purpose: To determine magnitude of need for a New York State Division for Youth START (Short Term Adolescent Resident Training) Center in Clinton County.
Subjects: Youth placed on probation for first time during the year July 1, 1960 to June 30, 1961.
Methods: Data collected from probation and school records were processed to provide special analyses.
Duration: July-October 1962.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)

17-M-50 AN EVALUATION OF THE START CENTER PROGRAMS AT MIDDLETOWN, BRENTWOOD, AND AUBURN

Purpose: This research will evaluate effectiveness of the START programs. START (Short Term Adolescent Resident Training) is a resident program limited to 20 youth, providing work experience and counseling for an average of four

months. Work experience is designed to develop wholesome work habits and attitudes. Counseling is designed to foster insight into underlying dynamics of forces facilitating delinquency and thereby modify values and behavior.
Subjects: Boys referred by courts to START Centers as a condition of their probation.
Methods: Data collected routinely from the centers are processed, and provide basis for special analyses.
Duration: January 1963-January 1968.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)

17-M-51 AN EVALUATION OF THE PROGRAM AT THE DIVISION FOR YOUTH HOME IN NEW YORK CITY

Purpose: To evaluate effectiveness of the Youth Rehabilitation Home in New York City, which is a supervised residence for 20 youths who will go to school or work in the community.
Subjects: Boys referred by courts to the New York City Home. Boys are randomly designated as experimentals (in the program) and controls (not in the program).
Methods: Data collected routinely from the Home are processed, and provide basis for special analyses.
Duration: February 1963-February 1968.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)

17-M-52 AN EVALUATION OF THE PROGRAM AT THE DIVISION FOR YOUTH HOME IN BUFFALO, N. Y.

Purpose: To evaluate effectiveness of the Youth Opportunity Home in Buffalo, which is a supervised residence for 20 youths who will go to school or work in the community.
Subjects: Boys referred by duly authorized agencies with the consent of their parents to the Buffalo Home. Boys are randomly designated as experimentals (in the program) and controls (not in the program).
Methods: Data collected routinely from the Home are processed, and provide basis for special analyses.
Duration: February 1963-February 1968.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)

17-M-53 A STUDY OF THE EFFECT OF GROUP SIZE ON APPROVED SCHOOL TREATMENT

Purpose: To discover whether treatment of approved school inmates may be better carried out in large units in which the role of peer groups would be important, or in smaller quasi-family units; to explore nature of group and interpersonal relations in such residential communities. Hypothesis: according to their degree of personal and social adjustment, boys may be more oriented toward adults or other boys in relationships they prefer to form.
Subjects: 50 boys, aged 13 to 16, in 15 intermediate schools; school staff.
Methods: Sociometric test as part of preliminary extensive survey, and a questionnaire for the staff. Intensive studies in a number of schools, chiefly through participant observation, are proposed.
Duration: October 1962-September 1965.
Investigator(s): Dr. Howard Jones, D. Perger, and A. Robertson, Department of Sociology, University of Leicester, Leicester, England. (Reported by NCCD.)
Cooperating group(s): Home Office.

17-M-54 JEFFERSON COUNTY JUVENILE COURT STUDY OF 60 DELINQUENT BOYS IN A GROUP RESIDENTIAL TREATMENT CENTER

Purpose: To determine the deterrent value of a specific method of treatment with a group of delinquent boys.
Subjects: 60 delinquent boys placed at Southfields Residential Group Treatment Center.
Methods: Longitudinal study designed to measure: (1) psycho-social findings prior to placement at the center; and (2) success and failure of juveniles completing the program and returning to the community.
Findings: Results through June 1963 indicate a positive method of treatment.
Duration: October 1962-continuing.
Investigator(s): Louis Scalo, ACSW, Senior Supervisor, Coy Dunlap, and David Owen, Jefferson County Juvenile Court, Room 800, Fiscal Court Bldg., Louisville, Ky. (Reported by NCCD.)
Cooperating group(s): Southfields Residential Group Treatment Center.

17-M-55 SUBJECTIVE IMPACT OF TRAINING SCHOOL EXPERIENCE ON MALE YOUTH AUTHORITY WARDS

Subjects: (1) 12 wards newly admitted to the Northern Reception Center-Clinic, selected as being likely to go to Preston School of Industry; and (2) 5 wards from Preston School of Industry, selected for qualities of intelligence and verbal ability.
Methods: Sequential interviews with first group tape recorded at two-week intervals at the Clinic and at six-week intervals at Preston. Collective interviews with second group at six-week intervals for several months, structured to provide a check on individual interviews held with first group and also to permit explorations into new areas.
Findings: Attitudes of training school wards appear to be shaped more by ward culture and ward social structure than by formal program and school staff. For a number of wards, training school experience probably results in increased recidivism. Others appear to respond positively to the experience. Results suggest need for alternatives to training school commitment for many wards as well as need for new programs to counteract present ward culture and social structure.
Duration: April 1959-continuing.
Investigator(s): William E. Cook, Ph.D., Joachim P. Seckel, M.A., and Keith S. Griffiths, Ph.D., Chief, Research Division, California Department of Youth Authority, 401 State Office Bldg. No. 1, Sacramento 14, Calif. (Reported by NCCD.)

17-M-56 COMPARISON OF LONG-TERM AND SHORT-TERM RESIDENTIAL TREATMENT FOR DISTURBED DELINQUENT GIRLS

Purpose: To study relative effectiveness of long-term (12 month) and short-term (3 month) treatment programs based on different treatment philosophies.
Subjects: Matched groups of approximately 150 each, selected from 400 disturbed, delinquent girls in long-term and short-term treatment programs. Subjects are primarily white, median ages 15.5 (short-term group) and 16.0 (long-term group), and represent all socio-economic levels, though heaviest concentration is from lower levels.
Methods: Personal and social history data, detention histories, offense characteristics, and clinical and psychometric data are collected to provide matching, baseline, and change information. Differences in performance during aftercare will be examined, including redetention after failure.
Findings: Preliminary findings indicate that attitudinal improvements are virtually the same in both institutional and aftercare phases.

Duration: October 1963-October 1965.
Investigator(s): Stuart Adams, Ph.D., Research Director, and Edgar W. Butler, M.A., Research Analyst, Los Angeles County Probation Department, P. O. Box 4002, Terminal Annex, Los Angeles 54, Calif.
Publication: Report will be released by Research Office, Los Angeles County Probation Department.

17-M-57 EVALUATION OF A TREATMENT PROGRAM FOR SERIOUSLY DISTURBED DELINQUENT GIRLS IN A PROBATION DEPARTMENT FACILITY

Purpose: To assess the total program of Las Palmas School for Girls.
Subjects: 100 girls, ages 15 to 18 who spent an average of 12 months at Las Palmas School.
Methods: Before-after measurements on a psychological inventory, intake and release clinical summaries, records of treatment experience, typological schemes, and post-release performance data. Evaluation will focus on psychometric and interpersonal behavioral changes by type of girl (Jesness, I-Level, and staff-designated types). Attention will also be centered on relative effectiveness of different program element configurations for specific types of girls and on extent to which intra-institutional changes carry over into the community after release.
Duration: August 1962-August 1965.
Investigator(s): Stuart Adams, Ph.D., Director of Research; Jean Heldoorn, M.S.W., M.R.E., and Alice Cassazza, Los Angeles County Probation Department, P. O. Box 4002, Terminal Annex, Los Angeles 54, Calif. (Reported by NCCD.)
Cooperating group(s): Los Angeles County Probation Department.

17-M-58 PROBATION: POSITION AND THE PROCESS

Purpose: To assess the relative effectiveness of different dispositions (positions) and supervision practices (treatment processes) in the probation setting, on the criterion of re-referral to probation. Theoretically, the research investigates effects of position assignment (being made a ward of the court and labelled a probationer) and treatment process (given supervision in the probation setting).
Subjects: Approximately 3,669 juveniles referred to eight southern California probation departments (excluding Los Angeles) for delinquent acts during a two-month period.
Methods: Procedures to record the actual frequencies and nature of contacts with youngsters will be used to assess supervision practices during the following year. Using eight administratively discrete probation departments provides the possibility of controlling statistically for characteristics of youngsters given different dispositions, so that the effects of these dispositions on the criterion can be legitimately assessed.
Duration: June 1963-July 1965.
Investigator(s): Alexander W. McEachern, M.A., Project Head, Youth Studies Center, and Visiting Associate Professor, School of Public Administration, University of Southern California, Los Angeles, Calif. 90007.
Cooperating group(s): County probation departments in Imperial, Kern, Orange, Riverside, San Bernardino, San Diego, Santa Barbara, and Ventura Counties, California.
Publication: Planned in correctional, sociological and psychological journals.

17-M-59 STUDY OF EFFECTIVENESS OF 12-GIRL PROBATION CASELOADS

Purpose: To determine feasibility and economic practicability of a program to remove "hard-to-place" girls from detention in Juvenile Hall and to manage them in the community in small probation caseloads of 12 girls, as contrasted with usual caseload of 65 girls.
Subjects: Approximately 50 girls, median age 15.5, with extensive Juvenile Hall detention histories. Sample includes whites, Negroes, and Mexican-American girls considered unsuitable for foster home placement or continuation at home under normal probation supervision. Subjects either failed to meet criteria for admission to Probation Department's residential treatment centers, or the centers lacked space for them.
Methods: Female probation officers worked intensively with girls, their parents, siblings, and other significant figures. Evaluation was made through comparison of frequency, duration, and kind of detention to which any subjects were returned during a five month follow-up with similar data for a matching group of girls released from Juvenile Hall to conventional programs.
Findings: Experimental group returned to detention less frequently (35 percent vs. 43 percent), remained out of detention longer (mean of 108 days vs. 66 days), were detained for shorter periods (26 days vs. 52 days), and went to California Youth Authority less frequently (zero vs. 29 percent).
Duration: July 1963-October 1964.
Investigator(s): Stuart Adams, Ph.D., Research Director, and Calvin C. Hopkinson, M.S.W., Los Angeles County Probation Department, P. O. Box 4002, Terminal Annex, Los Angeles 54, Calif.
Publication: An Interim Evaluation of the Intensive Supervision Caseload, Research Report No. 12, January 1964, 24 pp. (L. A. County Probation Department).

17-M-60 EVALUATION OF GROUP COUNSELING WITH BOYS ON PROBATION

Purpose: To determine effectiveness of group counseling with mildly delinquent boys in an early phase of probation.
Subjects: 100 Negro and Caucasian boys, median age 16, referred for burglary, car theft, incorrigibility, glue sniffing, and petty theft. Most are known to the juvenile court, but none have yet been placed in the probation camps of Los Angeles County.
Methods: Each of six deputy probation officers selected about 16 suitable subjects from his caseload. Boys were randomized into control and experimental groups. Experimental groups met once weekly after school for a 90-minute group counseling session. Controls received usual individual counseling about once monthly. Psychometric measurements, police contact, and detention data were collected for criterion purposes.
Findings: Experimental groups performed slightly better than controls in avoiding police contacts, probation camp commitments, and California Youth Authority commitments. Superiority markedly better when the best five out of six groups were considered.
Duration: June 1963-June 1964.
Investigator(s): Stuart Adams, Ph.D., Research Director, Los Angeles County Probation Department, P. O. Box 4002, Terminal Annex, Los Angeles 54, Calif.

17-M-61 AN EXPERIMENT IN THE SOCIO-PSYCHOLOGICAL TREATMENT OF JUVENILES ON PROBATION

Purpose: To study juvenile delinquency in Denmark from the aspects of law, sociology, psychology, and psychiatry. To experiment in the socio-psychological treatment of juveniles on probation. To test hypothesis that proceeding from the traditional, to the mixed, to the experimental group, treatment

results will show greater re-socialization attributable to and varying with extent of socio-psychological contact experienced by offenders.
Subjects: 2100 juvenile offenders; juveniles on probation.
Methods: Project divided into three major phases: (1) a survey of juvenile delinquency, its forms and incidence, and a detailed investigation of 2100 offenders with special attention to types of criminal careers and to case histories; (2) a treatment experiment with juveniles on probation, consisting of a socio-psychological investigation and therapy by a team of social workers, psychologists, and psychiatrists; and (3) a follow-up study of the probationers in which results for offenders undergoing special treatment are compared with results for offenders undergoing traditional treatment.
Duration: October 1960-1967.
Investigator(s): Karl O. Christiansen, Assistant Director, Institute of Criminal Science, University of Copenhagen, Copenhagen, Denmark. (Reported by NCCD.)
Cooperating group(s): Ford Foundation.

17-M-62 WORK THERAPY PROGRAM

Purpose: To organize, conduct, and evaluate a school work therapy program for approximately 60 predelinquent or delinquent 14 and 15 year old boys.
Methods: Subjects will spend one-half day in school and one-half day in the Rehabilitation Institute of the Jewish Vocational Service where they will engage in subcontract work. They will receive credit for their studies and wages for their work. Evaluation will utilize a control population to determine effectiveness of work as therapy for delinquent boys.
Duration: September 1962-January 1964.
Investigator(s): Hercules M. Porter, Jewish Vocational Service of Milwaukee, 207 E. Buffalo St., Milwaukee, Wis.
Cooperating group(s): Theodore J. Kuemmerlein, Director, Department of Pupil Personnel, Milwaukee Public Schools.

17-M-63 ASSESSMENT OF A SPECIAL FORESTRY CAMP PROGRAM FOR DISTURBED DELINQUENT BOYS

Purpose: To assess Camp Kilpatrick, a special forestry camp, as a treatment facility for disturbed delinquent boys.
Subjects: First 125 boys entering Camp Kilpatrick, each boy serving as his own control.
Methods: Psychological inventories, clinical evaluations, staff ratings, treatment experience records, camp work and school performance data, and community performance records. Major foci of interest: kinds of attitudinal and behavioral changes; relation of change to boy classification in the Jesness and I-Level typologies; relative effectiveness of program elements; and persistence of camp-associated change into post-release period.
Duration: September 1962-September 1965.
Investigator(s): Stuart Adams, Ph.D., Director of Research, Glennen Walker, and James Miyano, Los Angeles County Probation Department, P. O. Box 4002, Terminal Annex, Los Angeles 54, Calif. (Reported by NCCD.)

17-M-64 AN EVALUATION OF THE YOUTH REHABILITATION CAMPS AT RENSSELAERVILLE, N. Y. AND CAROLINE CENTER, N. Y.

Purpose: To evaluate effectiveness of Youth Rehabilitation Camps which provide a short-term camp program away from the community, featuring counseling

and supervised work for adjudicated delinquents who appear to need more than probationary supervision, and who do not appear to need long-term incarceration.
Subjects: Boys referred by courts to Youth Rehabilitation Camps as a condition of their probation. Boys will be randomly designated as experimentals (in the program) and controls (not in the program).
Methods: Data collected routinely from camps are processed, and provide basis for special analyses.
Duration: January 1963-January 1968.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)

17-M-65 AN EVALUATION OF THE PROGRAMS OF YOUTH OPPORTUNITY CAMPS AT GREAT VALLEY, N. Y. AND AT MASONVILLE, N. Y.

Purpose: To evaluate the effectiveness of Youth Opportunity Camps which provide a short-term camp program away from the community, featuring counseling and supervised work for youth referred by duly authorized agencies with consent of youths' parents.
Subjects: Boys referred by duly authorized agencies to Youth Opportunity Camps with consent of their parents. Boys will be randomly designated as experimentals (in the program) and controls (not in the program).
Methods: Data collected routinely from camps are processed, and provide basis for special analyses.
Duration: January 1963-January 1968.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)

EDUCATIONAL PROCESS

General

17-N-1 SOURCES OF EDUCATIONAL CLIMATES IN HIGH SCHOOLS

Purpose: To investigate sources of variations in educational and social climates of high schools in varying geographical and social contexts.
Subjects: Student bodies and staffs of 20 U. S. high schools in several geographical areas.
Methods: Survey research techniques using questionnaire, interview, and observational data in a panel design.
Findings: First findings available February 1965.
Duration: June 1963-June 1966.
Investigator(s): James S. Coleman, Ph.D., Professor of Social Relations, Johns Hopkins University, Baltimore 18, Md., and Edward L. McDill, Ph.D., Assistant Professor of Sociology, Vanderbilt University, Nashville 5, Tenn.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report to Cooperative Research Branch, Office of Education.

17-N-2 INFLUENCE OF "RESSENTIMENT" ON STUDENT EXPERIENCE IN HIGH SCHOOL

Purpose: To assess the effect of social climates in secondary schools on student values and creativity.
Subjects: Pretest assessment of social climate: 100 students in grades 10 to 12 in each of seven public and two private high schools. Intensive interview: 25 of each group of 100.
Methods: Pretest assessment employs G. G. Stern High School Characteristics Index supplemented by additional items in same format designed to assess "ressentiment".
Duration: August 1962-June 1965.
Investigator(s): Edgar Z. Friedenberg, Ph.D., Associate Professor of Education, Carl Nordstrom, Ph.D., Assistant Professor of Economics, and Hilary Gold, Ph.D., Assistant Professor of Education, Brooklyn College, City University of New York, Brooklyn 10, N. Y.
Cooperating group(s): College Entrance Examination Board; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Report to Cooperative Research Division, Office of Education by June 30, 1965. Material also to be included in popular form in a book now being written under contract with Random House. Serendipitous findings reported in Commentary at various times in past year.

17-N-3 EDUCATIONAL ASPIRATIONS OF FARM BOYS AND GIRLS

Purpose: To identify factors, especially school factors, associated with various levels of educational aspiration.
Subjects: Juniors and seniors in 35 rural high schools.
Methods: Questionnaires and interview.
Duration: August 1963-June 1966.
Investigator(s): Walter L. Slocum, Ph.D., Professor and Chairman, Department of Rural Sociology, Washington State University, Pullman, Wash.
Cooperating group(s): Department of Education, Washington State University; Office of Education, U. S. Department of Health, Education, and Welfare.

17-N-4 FOLLOW-UP STUDIES OF DETERMINANTS OF EDUCATIONAL-VOCATIONAL CHOICES

Purpose: To develop progressively more complex answers to the question of how educational-vocational choices of public school and university students are determined. To lay ground work for an adequate theory of educational and career development, and for later experimental investigations on diverse populations.
Subjects: Drawn from 7627 public school pupils in grade 9 during spring 1960, and 1596 students who were University of Hawaii freshmen in 1960, representing over 80 percent of enrollment figures in Hawaii.
Methods: Descriptive, comprehensive, longitudinal, and comparative studies of student characteristics. Assignment to control and experimental groups based on educational-occupational status at follow-up compared with educational status three years earlier. Dependent measures: reported determinants, measured ability, educational-occupational plans, and selected social-personal characteristics. Studies of characteristics of determinants will be analytical, correlational, longitudinal, representative, and comparative. Inventory items and scales will be treated as antecedent categories against criteria of consistency upon replication, and of educational-occupational status on follow-up. Data to be collected through two parallel inventories: What I Like To Do, and Reasons for Going to College.
Duration: June 1963-September 1964.
Investigator(s): Arthur A. Dole, Ph.D., Associate Professor of Psychology, University of Hawaii, Honolulu, Hawaii 96822.
Cooperating group(s): Social Science Research Institute, University of Hawaii; Hawaii State Department of Education; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted to appropriate journals and to Office of Education.

Achievement, aptitude, and school adjustment

17-O-1 PRESCHOOL PREDICTION OF SCHOOL ADJUSTMENT

Purpose: Long range goal is to determine whether immaturity for school (academic, social, emotional) can be detected in order to obviate some otherwise highly probable "failures". Immediate purpose is to obtain correlations and probability tables of (1) preschool tests; and (2) achievement test results and teacher ratings.
Subjects: Children who will enter first grade in the fall, and who will have had no previous kindergarten experience.
Methods: Subjects are tested during spring preceding their entrance in first grade. Later school performance is reflected in teacher ratings in reading, math, social and emotional adjustments, and by achievement tests.
Findings: Lowest correlations of predictor and criterion variables found to be .65 in first year group.
Duration: 1960-1964.
Investigator(s): Willard H. Nelson, Ph.D., Associate Professor of Psychology and Education, Florida State University, Tallahassee, Fla.
Cooperating group(s): Gadsden County Schools.
Publication: Planned in education and/or psychology journal.

17-O-2 PREDICTION OF SCHOOL ACHIEVEMENT AND ADJUSTMENT

Purpose: To discover how well a standard battery of psychological tests will

predict school achievement in a longitudinal sense; to discover the most efficient predictors and the main problems in prediction; to collect test norms in a longitudinal developmental sense.
Subjects: First grade school children beginning their first week in two small suburban elementary schools. After three years, number now is 58.
Methods: Standard battery of psychological tests, including Binet, Bender-Gestalt, Draw-a-Person, and Rorschach has been given during first week of school year to the same children, beginning in fall of 1960. School achievement in terms of grades and ranks, and school adjustment in terms of teachers' comments have been collected every June. Testing will continue throughout school career of these children with some modification, particularly in terms of intelligence test used. School progress will also be followed. Data will be analyzed for trends, patterns and relationships at regular intervals.
Findings: Preliminary findings suggest that total battery, using criterion of two-thirds of quantitatively scored tests (Binet, Bender-Gestalt and Draw-a-Person) or three-fourths of tests on a sign basis at appropriate level of maturity (i.e., 6-0 at beginning first grade) gives a relatively adequate prediction basis. Statistics have been computed with reference to first testing (1960) only, using first grade patterns to predict first and second grade academic achievement. Certain individuals show patterns which elude prediction on any basis.
Duration: September 1960-indefinite.
Investigator(s): Inger A. Olsen, Ph.D., H. Elizabeth Jensen, M.A., and Mary Robitaille, B.A., Psychologists, Mental Hygiene Division, Metropolitan Health Services, 456 W. Broadway, Vancouver 5, B. C.
Cooperating group(s): School Board, Municipality of Burnaby.
Publication: One introductory article submitted to Pulse (Vancouver School Board Special Counsellors Journal). Several articles planned for publication in psychological and child development journals.

17-O-3 SOCIAL AND CULTURAL FACTORS RELATED TO SCHOOL ACHIEVEMENT

Purpose: (1) To provide a thorough description and analysis of the way of life of a school-age population in one high school district in the inner core of a middle-sized northern city; (2) to provide benchmarks, particularly with reference to school achievement, against which to measure the effect of demonstration programs to begin at a later date; (3) to describe the needs of the school-age population, as they see it, with reference to experience and opportunities; (4) to describe the desires, goals and aspirations of the school-age population to better understand their system of motivation.
Subjects: 100 boys and 100 girls from grades 4, 6, 8, 10, and 12. The 10th and 12th graders will be drawn from one high school; the 8th graders from the two junior high schools; the 4th and 6th graders from three of the elementary schools in the district.
Methods: (1) Intensive interviews with students; (2) administration of a self-administered questionnaire to all students; (3) participant observer will live in the area to observe out-of-school life, particularly of older students.
Duration: September 1963-September 1965.
Investigator(s): Harry C. Bredemeier, Ph.D., and Bernard Goldstein, Ph.D., Urban Studies Center, Rutgers, The State University, New Brunswick, N. J.
Cooperating group(s): Newark City Board of Education; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Articles, monographs, etc., are planned.

17-O-4 A COMPARATIVE STUDY OF ACADEMIC ACHIEVEMENTS OF ELEMENTARY AGE STUDENTS IN THE UNITED STATES AND THE BRITISH ISLES

Purpose: To determine whether academic achievement of elementary age pupils

in the United States is significantly different than that of their counterparts in the British Isles; to determine whether achievement of pupils in United States differs significantly when examining pupils of similar ability levels; and to determine specific periods within and across the elementary grades where differences do occur.
Subjects: Random samples of approximately 4400 pupils of varying ability levels have been selected from American and English communities and schools within these communities having like characteristics. These students have been selected from both private and public schools in the United States and British Isles.
Methods: Standardized achievement and I.Q. tests, agreed upon by American and British participants are being administered, the former in September 1963, February and May 1964; the latter in September 1963. Reliability and validity of instruments used will be obtained. Analysis of variance, utilizing electronic computers, will be made to statistically accept or reject the stated hypotheses. Results of the collection, tabulation and analyses of the data will be summarized and disseminated.
Duration: June 1963-September 1964.
Investigator(s): Robert L. Gibson, Ed.D., Assistant Dean, College of Education, University of Toledo, Toledo, Ohio.
Cooperating group(s): Ministry of Education for Northern Ireland; National Foundation for Education Research in Scotland; National Foundation for Educational Research in England and Wales; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Summary of study will be published by University of Toledo following completion of analysis.

17-0-5 SCHOOL ACHIEVEMENT AS RELATED TO DEVELOPMENTAL SPEECH INACCURACY

Purpose: To consider: (1) academic achievement among children with developmental speech problems as compared to children without speech problems; (2) effect of speech therapy with children who evidence developmental speech problems on speech difficulty and school achievement.
Subjects: Entire first grade population of two local suburban schools.
Methods: Battery of new speech and modality tests developed at the University of Chicago, readiness tests, and achievement tests administered at three intervals during study.
Duration: July 1963-June 1967.
Investigator(s): Joseph M. Wepman, Ph.D., Professor, Departments of Surgery and Psychology, University of Chicago, Chicago 37, Ill.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Relevant research journals.

17-0-6 A STUDY OF FIRST GRADE FAILURE: DIAGNOSIS, TREATMENT AND PREVENTION

Purpose: To determine the causes and psycho-educational treatment and prevention of failure in the first grade.
Subjects: 20 first grade failures for two consecutive years.
Methods: Interdisciplinary approach: intensive social, psychological, medical and educational diagnosis; psycho-educational treatment based on diagnostic findings; development of psycho-educational techniques and materials for the prevention of failure.
Duration: September 1962-June 1964.
Investigator(s): Katharine C. Cotter, Ph.D., Associate Professor of Education, Boston College, Chestnut Hill 67, Mass.
Cooperating group(s): Nazareth Child Guidance Center.
Publication: Probably in a professional education journal.

17-O-7 SURVEY OF VOCATIONAL APTITUDES OF A SELECTED SAMPLE OF DROPOUTS FROM A BALTIMORE JUNIOR HIGH SCHOOL

Purpose: To determine proportion of school dropouts having sufficient aptitude to acquire job training, or the minimum skills required to contribute acceptably in a competitive labor market.
Subjects: 45 cases drawn from eighth and ninth grade students who dropped out of a Baltimore junior high school during a two-year period.
Methods: Series of aptitude tests administered to sampled cases before their dropout from school. Data analyzed and described statistically, and compared with the "normal" nondropout school population.
Findings: Tentative results indicate that one-half of junior high school dropout population has sufficient aptitudes to make a usable and meaningful contribution to the labor market.
Duration: Spring 1962-fall 1964.
Investigator(s): Neil R. Lovelace, Ed.D., Specialist in Testing, Bureau of Educational Testing, Baltimore Public Schools, Baltimore 18, Md. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Summer 1963.)

17-O-8 INTERVIEW FOLLOW-UP OF MINNEAPOLIS SCHOOL DROPOUTS

Purpose: To compare personal-social data as obtained through interviews with data obtained through school records in relation to school dropout and delinquency.
Subjects: Samples of recent graduates, school dropouts, and their parents.
Methods: Structured interview.
Duration: March 1963-January 1965.
Investigator(s): Robert D. Wirt, Ph.D., Professor of Psychology, University of Minnesota, Minneapolis 14, Minn.
Cooperating group(s): Minneapolis Group Development Project; Minneapolis Public Schools; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-O-9 DELINQUENCY, DROPOUT, AND THE SOCIAL MILIEU OF THE SCHOOL

Purpose: To locate the sources of strain and tension within the school milieu, and to relate these specific kinds of tension-producing situations to delinquency and school dropout. On the basis of theoretical orientation, particular attention will be focused upon: (1) delinquency and dropout; (2) dropouts and employment; (3) occupational aspirations and school achievement; and (4) status deprivation and delinquency.
Subjects: Random sample of all San Diego ninth grade students (N=3,000) in fall 1963; parent of each student.
Methods: Annual questionnaire for four years to subjects; interview of parents at beginning and end of study. Delinquency data will be gathered and dropouts will be followed regardless of mobility.
Duration: February 1963-February 1968.
Investigator(s): Delbert S. Elliott, Ph.D., Assistant Professor, and Aubrey Wendling, Ph.D., Professor and Chairman, Department of Sociology and Anthropology and Director, Social Research Center, San Diego State College, San Diego 15, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Annual progress reports will be issued. Articles in professional journals, papers, and a book are planned.

17-O-10 FAMILY FACTORS AND SCHOOL DROPOUT: 1920-1960

Purpose: To investigate changes occurring over the last 40 years in influence of social background and community climate on educational attainment of adolescent males. Association between attainment and factors such as education and occupation of family head and number of siblings will be examined for whites and nonwhites in 1960, and at eight earlier dates back to 1916-20. Relationship between occupational positions obtained by young men upon entry into the work force and their education also will be explored at nine points in time. Shifts in spatial aspect of dropout phenomenon between 1920 and 1960 will be explored in relation to changes in community structure, such as economic opportunities for youths and proportion of two-generation urbanites among adolescents.
Methods: Studies rely upon statistics collected by Bureau of the Census in decennial Censuses of Population and the March 1962 Current Population Survey. Special tabulations are being prepared by the Census Bureau for a sample of about 22,000 native males aged 20 to 61 in 1962, relating their educational attainment to other characteristics. Tabulations of a sample of about 5,700 native males aged 14 to 17 in 1960 are being prepared from the one-in-a-thousand sample tape of the 1960 Census of Population. Analyses will rely primarily on regression techniques. Statistics on spatial aspects of the dropout phenomenon are drawn from published data of the Bureau of the Census.
Duration: July 1963-September 1965.
Investigator(s): Beverly Duncan, Ph.D., Research Associate, Population Studies Center, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Results will probably be presented in monographic form and/or in journal articles.

17-O-11 SCHOOL DROPOUT PROBLEM IN BUFFALO

Purpose: To ascertain number of school dropouts, their characteristics, concentration of residence by census tracts, and economic characteristics of areas where dropouts are concentrated, compared with the characteristics of areas where dropouts are scarce. To determine extent to which school dropouts utilize state facilities for placement.
Methods: Data collected from school records and New York State Employment Service records were processed to provide special analyses.
Duration: October 1962-April 1964.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)
Cooperating group(s): Buffalo Public School System; Erie County Welfare Department; New York State Employment Service.

Specific skills

17-P-1 RELATIONSHIPS BETWEEN SELECTED LANGUAGE VARIABLES AND COMPREHENSION ABILITY AND DIFFICULTY

Purpose: To find linguistic variables that will improve ability to predict comprehension difficulties of children in written and verbal materials.
Subjects: 875 children, nearly equally distributed in grades 4 to 8.

Methods: Twenty passages of approximately 250 words in length were selected from each of five subject matter areas. Within each subject matter area, passages were about evenly distributed in Dale-Chall formula predicted readability from grades four through eight (uncorrected). Five cloze test forms were made over each passage by the "every-fifth-word-deletion" technique. This allowed every word in every passage to appear as a test item exactly one time. Each form was administered to one of five groups matched for mean and distribution of reading ability. Item difficulties were then computed for each word. This was taken as the criterion of comprehension difficulty of that word. These values and the averages of these values computed across linguistic units of various sizes were then correlated with various linguistic variables.
Duration: June 1963-August 1964.
Investigator(s): John R. Bormuth, Ed.D., Assistant Professor of Education, University of California, Los Angeles 24, Calif.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: At least three journal articles and a monograph will be published.

17-P-2 MULTIPLE COUNSELING WITH FOURTH GRADE BOYS AND GIRLS HANDICAPPED IN LANGUAGE ARTS COMMUNICATION

Purpose: A pilot project to investigate the value of multiple counseling with fourth grade boys and girls who, because of emotional handicaps, are unable to function verbally at a level commensurate with their measured mental ability.
Subjects: Two classes of about 10 students each, ages 8 to 10, of both sexes, and who were "underachieving" in school and who were adjudged to be underachieving because of affective flatness and limited ability to communicate effectively with peers, parents and teachers.
Methods: Each group met in a schoolroom for an hour daily during the summer for six weeks with a psychologist who had previous teaching experience, and was a specialist in reading and language arts. The program was unstructured except as students themselves desired it. Students were given extensive ego support therapy and were helped to function better in the communication process. Monthly meetings were held over a period of a year with the parents. These were designed to help them come to a more comprehensive understanding of their children and their abilities.
Findings: Fourth grade boys and girls can respond to, and be effectively helped by, a multiple counseling program designed to strengthen self-concept and improve basic communication. It is most effective when parents can become involved in a year-long program designed to help them see changes which are taking place in their children.
Duration: June 1961-June 1962.
Investigator(s): Dorothea Brayer, M.S., School Psychologist, and William L. Smith, Ph.D., Coordinator, Pupil Personnel Services, Webster Central School, Webster, N. Y.
Publication: None anticipated.

17-P-3 LONGITUDINAL STUDY OF LANGUAGE SKILLS IN CHILDREN WITH VARYING SPEECH SOUND ARTICULATION

Purpose: To identify factors related to articulation, spelling, and reading at third or fourth grade level. To study relationships between a variety of language skills over a period of time. To describe development of consonant articulation. To carry on ancillary studies with samples selected on

different language variables. This is an extension of an earlier study (Bulletin 12, Research Relating to Children) which followed children through second grade.
Subjects: 490 children in three groups: (1) children whose articulation differs with and without an aural model; (2) children with single phoneme misarticulations -/l/, /r/, /s/; and (3) children with total articulation scores clustering about the 7th, 15th, 30th, 50th, and 98th percentiles.
Methods: Testing will relate to previously gathered data and will include measures of articulation, grammar, syntax, word association, reading, spelling, sound-letter association, and written and oral language. Stimulus materials for ancillary studies being developed. Analyses will include identification of factors predicting articulation, reading and spelling skills, determination of interrelations among language variables, and description of their development.
Duration: January 1960-September 1966.
Investigator(s): Mildred C. Templin, Ph.D., Professor, Institute of Child Development, University of Minnesota, Minneapolis 14, Minn.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

17-P-4 SUBSTRATA-FACTOR CHANGES ACCOMPANYING DEVELOPMENT OF GENERAL READING ABILITY AT THE ELEMENTARY SCHOOL LEVEL

Purpose: To test two hypotheses derived from the substrata-factor theory of reading: (1) development of general reading ability is accompanied by systematic changes in magnitude of substrata elements and/or reorganization in working-systems mobilized for power and speed of reading; and (2) individuals in intermediate grades are at a transitional stage of development in kinesthetic-auditory-visual gradient shift sequence. During upper elementary grades, psychoeducational factors interact with their maturing physiological substrata to result in a shift in dominance in individual's working system from an auditory to a visual modality.
Subjects: Approximately 200 children drawn from three successive upper elementary grades.
Methods: Administration of an empirically-determined battery of 36 variables. Resulting data will be analyzed by means of correlation, substrata analysis, and analysis by correspondence for each grade level. Comparison of analyses across the grades will be made in order to infer whether hypotheses are tenable.
Duration: February 1963-January 1965.
Investigator(s): Harry Singer, Ph.D., Assistant Professor of Education, University of California, Riverside, Calif.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Article to appear in Review of Educational Research in April 1964; interim report to be published in Proceedings of the International Reading Association in 1964; final report to Office of Education in January 1965.

17-P-5 THE EXPERIMENTAL DEVELOPMENT OF THE SET OF VARIABILITY IN RATE OF READING.

Purpose: To attempt to develop experimentally in intermediate grade children the set of flexibility in rate of reading as a function of one's purpose for reading and nature of material read; and to measure the effects of a flexible rate of reading set upon comprehension, speed and stress in reading performance.
Subjects: 128 elementary school children in grades 4 to 6 in public schools.

Methods: Survey of extent to which flexibility in rate of reading exists. Train two selected groups of readers, one with high speed sets and one with low speed sets, to vary rate as a function of reading purpose and the nature of material read.
Duration: September 1962-August 1964.
Investigator(s): Theodore L. Harris, Ph.D., Professor of Educational Psychology, Virgil E. Herrick, Ph.D. (deceased), James B. Macdonald, Ph.D., Professor of Education, and G. Lawrence Rarick, Ph.D., Professor of Physical Education, University of Wisconsin, Madison 6, Wis.
Publication: Material to be submitted to American Educational Research Association and American Psychological Association.

Special education

17-Q-1 THE EFFECT OF PROGRAMMED INSTRUCTION IN SPECIAL SKILLS DURING THE PRESCHOOL PERIOD ON LATER ABILITY PATTERNS AND ACADEMIC ACHIEVEMENT

Purpose: To enrich the environment of impoverished children to determine if this will increase their educability.
Subjects: Preschool children, both rural and urban.
Methods: Programmed instructional procedures.
Duration: July 1962-October 1965.
Investigator(s): Eugene R. Long, Jr., Ph.D., Professor of Psychology, University of North Carolina, Chapel Hill, N. C.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Journal of the Experimental Analysis of Behavior 6:459-472, 1963.

17-Q-2 EDUCATIONAL ENRICHMENT FOR A SMALL GROUP OF ABLE THOUGH CULTURALLY DEPRIVED JUNIOR HIGH SCHOOL AGE BOYS

Purpose: To test the effectiveness of a community sponsored educational club to help culturally deprived students overcome their educational handicap.
Subjects: 32 junior high school students.
Methods: Comparison of experimental and control groups for change along several attitude and ability dimensions, after a year's participation in the program.
Duration: September 1961-continuing.
Investigator(s): Eugene Stivers, Ph.D., Assistant Professor of Education, Los Angeles State College, Los Angeles 32, Calif.
Cooperating group(s): Junior League of Los Angeles.
Publication: Two reports: spring 1963 and fall 1963.

17-Q-3 PROGRAM FOR COGNITIVE AND MOTIVATIONAL DEVELOPMENT OF THE SCHOLASTICALLY RETARDED CHILD

Purpose: To enrich cognitive abilities of children of normal intelligence from lower socio-economic backgrounds, having less scholastic success and greater incidence of reading retardation than children from more fortunate circumstances.

Methods: Enrichment of following abilities during kindergarten: perceptual, attentional, conceptual, informational and verbal, to demonstrate that a correct enrichment program can reverse the disability of these children. Evaluation made of enrichment procedure through comparison with control group, measurement of abilities concerned immediately following program and again two years later.
Investigator(s): Martin Deutsch, Ph.D., Associate Professor, Martin Whiteman, Ph.D., Associate Research Professor, Shirley Feldman, Ph.D., Instructor and Coordinator of Remedial Services, and Suzanne Keller, Assistant Research Professor, Institute for Developmental Studies, Department of Psychiatry, New York Medical College, Flower and Fifth Avenue Hospitals, New York 29, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-Q-4 COUNSELING AND GUIDANCE FOR UNDERACHIEVING FOURTH GRADE STUDENTS

Purpose: To employ some of the established secondary school guidance techniques at the elementary level to determine their effectiveness in altering underachievement and personal behavior; to determine the concomitants of underachievement at the elementary level.
Subjects: 100 underachieving fourth grade students. "Underachiever" is here defined as a student whose earned GPA is approximately one standard error of estimate below his predicted GPA.
Methods: In first semester of school year 1963-64 a Wechsler Intelligence Scale for Children (WISC) was administered to fourth grade children in 10 elementary schools. The CTP and SSSR were also administered. Underachievers in each classroom were identified and randomly assigned by conditions: (1) individual counseling; (2) group counseling; (3) reading instruction; (4) attention, or "Hawthorne effect;" and (5) control.
Duration: September 1963-September 1964.
Investigator(s): Paul F. Munger, Ph.D., Professor of Education, Indiana University, Bloomington, Ind., and Ronald C. Winkler, Ph.D., Instructor, Counseling and Guidance, University of North Dakota, Grand Forks, N. Dak.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Results will be published in various counseling and guidance journals.

17-Q-5 EFFECTS OF MENTAL HEALTH SERVICES UPON A CLASS OF NONACHIEVING CHILDREN

Purpose: To postulate the differential effects of alternative mental health services for nonachieving children placed in a special class.
Subjects: Seven nonachieving children and their parents; two control groups of 11 nonachieving children in conventional classrooms.
Methods: Special class conducted with experimental group for two and one half years. Meetings were held with parents, and extensive intelligence and achievement tests were administered to sample. Interviews were held with special class children and their alternates to compare attitudes of parents and their children regarding academic and social achievements.
Investigator(s): James G. Kelly, Ph.D., Chief, Community Projects Section, J. R. Newbrough, Ph.D., Director, Reading Project, and Fortune V. Mannino, Ph.D., Director, Consultation Service Unit, Mental Health Study Center, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, 2340 University Blvd. East, Adelphi, Md.

17-Q-6 INFLUENCE OF VISION TRAINING UPON SUBSEQUENT READING ACHIEVEMENT OF FOURTH GRADE CHILDREN

Purpose: To answer questions regarding effectiveness of vision training, procedures, and stability of changes, with implications regarding epidemiology of reading disability.
Subjects: Random sample of fourth grade disabled readers, divided into two groups of 40 or more.
Methods: Subjects are examined by a psychologist and an optometrist (expert in children's vision) to confirm a one and one-half year difference between MA and reading age, and that vision training is indicated. Experimental group receives vision training; control group does not. Both groups receive remedial reading instruction. Follow-up study one year later will measure stability of any discovered changes.
Duration: January 1963-January 1967.
Investigator(s): Charles B. Huelsman, Jr., Ph.D., Professor of Psychology, Ohio State University, Columbus 12, Ohio, and Lois B. Bing, O.D., Ontometrist, Cleveland, Ohio.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

17-Q-7 EXPERIMENTAL STUDY OF REMEDIAL READING INSTRUCTION FOR YOUNG DELINQUENTS

Purpose: To assess amount and quality of reading improvement exhibited by wards completing a program of intensive remedial reading instruction at Fricot Ranch School, and to determine how this is related to their attitudes and adjustment.
Subjects: Eight classes of about 15 students each, varying from nonreaders to severely retarded and nonretarded readers.
Methods: Subjects allocated to four sets of classes; within each set, students equated by I.Q. and reading achievement scores. One class in each set receives remedial reading; others receive regular reading instruction for first three months of experimental period. Alternate classes from each set given remedial reading the following three months. Two control groups not exposed to remedial training during the study.
Duration: 1962-1965.
Investigator(s): William E. Cook, and Joachim P. Seckel, M.A.; Keith S. Griffiths, Ph.D., California Department of the Youth Authority, 401 State Office Bldg. No. 1, Scramento 14, Calif. (Reported in *Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency*, Summer 1963.)

17-Q-8 EFFICACY OF PREVOCATIONAL CURRICULUM AND SERVICES DESIGNED TO REHABILITATE SLOW LEARNERS WHO ARE SCHOOL DROPOUT, DELINQUENCY, AND UNEMPLOYMENT PRONE

Subjects: 124 slow learners (62 experimental, 62 control) in grades 7 through 12 screened from 402 potential subjects referred by teachers, counselors, and previous records of psychological testing.
Methods: Subjects will be divided into four treatment groups: (1) prevocational curriculum and prevocational services; (2) traditional curriculum and prevocational services; (3) prevocational curriculum but no prevocational services; and (4) traditional curriculum and no prevocational services. It is hypothesized that group (1) will be superior to groups (2), (3), and (4), and that this superiority will be most striking when group (1) is compared to group (4).
Duration: July 1962-1965.
Investigator(s): Merle B. Karnes, Ed.D., Director of Special Services, Champaign Community Unit 4 Schools, 705 S. New St., Champaign, Ill.

Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Progress report published by Champaign Community Schools, March 1963.

17-Q-9 SCHOOL CENTERED REHABILITATION PROGRAM FOR PREGNANT SCHOOL-AGE GIRLS IN WASHINGTON, D. C.

Purpose: To determine the validity of grouping pregnant girls in a school setting with a rehabilitation program provided by a multi-disciplinary team; to show the value of cooperative inter-agency action in meeting needs of expectant mothers of school age.
Subjects: 125 pregnant school-age girls.
Methods: Regular curriculum is offered plus additional content in personal and family living, social customs, mores, and basic needs of individuals. Supervision of girls' health needs including prenatal, delivery, and postnatal care. Individual counseling with each girl and her parents. Case records kept for each girl including interpretation of data and recommendations for implementing the program.
Duration: June 1963-May 1966.
Investigator(s): Elizabeth M. Goodman, Principal, Sharpe Health School, D. C. Public Schools, 13th and K St., N. W., Washington 5, D. C.
Cooperating group(s): D. C. Departments of Public Health and Public Welfare; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

17-Q-10 A COOPERATIVE JOB TRAINING PROGRAM FOR RETARDED YOUTH

Purpose: (1) To develop a practical program of vocational instruction in the public high school for mentally retarded youth; (2) to test effectiveness of cooperative work experience in preparing for and establishing mentally retarded youth in self-sustaining employment; and (3) to develop criteria for predicting success of mentally retarded youth in cooperative work-experience programs and subsequent employment.
Subjects: Mentally retarded youth, aged 16 and over, enrolled in high schools of Evansville, Indiana. Random sample of 74 pupils currently involved in experimental and control treatment.
Methods: Experimental group receives cooperative work-experience treatment; control group takes two periods per day of "practical arts" courses. Other educational experience similar. Follow-up studies after separation from school to be conducted.
Duration: April 1963-March 1966.
Investigator(s): Max Eddy, Ed.D., Associate Professor of Industrial Education, Purdue University, Lafayette, Ind.
Cooperating group(s): Evansville School Corporation; Purdue Research Foundation; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-Q-11 DEVELOPMENT OF A COOPERATIVE VOCATIONAL PATTERN FOR IN-SCHOOL MENTALLY RETARDED YOUTH

Purpose: To establish improved articulation between school and work experiences of mentally retarded adolescents. To demonstrate a pattern of professional relationships among a State rehabilitation agency, a school system, and a community workshop designed to bridge the school-work gap.

Subjects: Students in their final year of educational experience in special classes of the Newark School System.

Methods: Students attend a special program twice a week at the Occupational Center, Essex County. Orientation and group experiences are provided first semester. Initial evaluation experiences begin near end of semester and continue through second semester; remunerative work activity in the Occupational Center follows if feasible. Students continue their service at the Occupational Center and the New Jersey Rehabilitation Commission following graduation. Effectiveness of program in enhancing the vocational preparation of the experimental subjects evaluated.

Duration: 1963-1966.

Investigator(s): Arthur Bierman, Occupational Center of Essex County, Inc., 29 S. Sixth St., Newark 7, N. J.

Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

17-Q-12 AN INVESTIGATION OF THE TERMINAL PUBLIC SCHOOL SPECIAL CLASS CURRICULUM AND ENVIRONMENT AND VOCATIONAL REHABILITATION OF MENTALLY RETARDED YOUNG ADULTS

Purpose: Primarily, to establish 11 demonstration projects for mentally retarded young adults in selected rehabilitation facilities.

Subjects: Educable mentally retarded young adults, chronological ages 16 to 21, having I.Q.'s from 50 to 75.

Methods: Projects located in 11 cities in Alabama, being housed in physical facilities within a rehabilitation facility, affording a workable approach to evaluation and placement within the rehabilitation setting.

Duration: September 1961-August 1964.

Investigator(s): Jasper Harvey, Ph.D., Professor and Chairman, Department of Special Education, University of Alabama, University, Ala.

Cooperating group(s): 11 rehabilitation facility boards; 19 local county and city boards of education; Division of Rehabilitation and Crippled Children, and Program for Exceptional Children, Alabama State Department of Education.

Publication: Second year report available from principal investigator.

17-Q-13 A COORDINATED REHABILITATION PROGRAM FOR HANDICAPPED YOUTH--STUDY AND DEMONSTRATION

Purpose: To establish a four-year coordinated program for rehabilitation counseling and related services for handicapped high school students in the School District of Kansas City, Mo.

Subjects: Comparable experimental and control groups of 75 ninth grade students with disabilities other than mental retardation.

Methods: Experimental group receives four-year coordinated program of evaluation, educational counseling, personal counseling, vocational counseling, and trial work experience. Four-year follow-up of experimental and control groups and comparison by objective measures of vocational adjustment.

Duration: May 1963-August 1968.

Investigator(s): Bertram Brant, M.A., Executive Director, Jewish Vocational Service, 1606 Main St., and Clyde J. Baer, Ed.D., Director of Research, School District of Kansas City, Kansas City, Mo.

Cooperating group(s): Kansas City Association of Trusts and Foundations; School District of Kansas City; Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

17-Q-14 DEMONSTRATION OF THE BENEFITS OF ORIENTATION AND MOBILITY TRAINING BY COMPETENT INSTRUCTORS OF BLIND STUDENTS IN JUNIOR AND SENIOR HIGH SCHOOLS

Purpose: To utilize adult-validated orientation and mobility skills for blind junior and senior high school students enrolled on the Catholic Charities programs for the blind.
Subjects: 13 junior and senior high school students, ages 11 to 16, who have received training in orientation and mobility techniques.
Methods: The teaching is done by a professional, full time, sighted instructor on an individual tutoring basis during or after the regular school day, using adult-validated skills with minor revisions. Hand and arm protection and the "Long Cane" technique are two of the mobility methods taught.
Findings: Findings can only be termed, "indications" at this point. Although reasonable success has been achieved in the teaching of orientation and mobility skills with junior and senior high school students, it is felt that there is a need for gaining independent skills, skills in the area of physical activity, and a greater awareness of the environment at an earlier age. Also, orientation and mobility should be a fundamental part of the blind child's education and should begin at the primary level.
Duration: August 1963-June 1967.
Investigator(s): Patricia Bledsoe, Ph.D., Director, Guidance Clinic, Robert Gockman, B.S., Instructor, Orientation and Mobility, and Marian C. Quinn, M.A., Director, Department of Vision and Hearing, Catholic Charities, 126 N. Desplaines St., Chicago 6, Ill.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Written summary at the completion of demonstration.

17-Q-15 EMPLOYMENT TRAINING IN ON-THE-JOB WORK SITUATIONS FOR HANDICAPPED ADOLESCENTS

Purpose: To demonstrate and evaluate a four year vocationally oriented educational program for handicapped children, beginning in grade nine.
Subjects: 150 experimental and 150 matching control pupils, aged 14, representing different categories of physical, mental, and emotional handicaps.
Methods: Subjects receive both in-school and on-the-job instruction, with program divided into four phases: (1) employee-oriented; (2) industry-oriented; (3) skills-oriented; and (4) career-oriented. On-the-job instruction is provided by employees of the industries cooperating in this project, and is complemented by a coordinated school program. Instruments and procedures will be developed to assess progress and outcomes. Data pertaining to pupils' attitudes, understanding of vocations, and reactions of employees and parents will be gathered for evaluation.
Duration: 1962-1967.
Investigator(s): Samuel M. Goodman, Ph.D., Assistant Director of Research, James R. Ward, Supervisor of Field Studies, and Paul H. Humphries, Research Psychologist, Montgomery County Public Schools, 850 N. Washington St., Rockville, Md.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

17-Q-16 AN EVALUATION OF THE BEDFORD YMCA TRADE SCHOOL PROGRAM

Purpose: To evaluate effectiveness of a special program for school dropouts developed by the Bedford YMCA in conjunction with the New York State Division for Youth and the New York State Employment Service.
Subjects: Currently unemployable 16 to 18 year old school dropouts.
Methods: Data collected routinely from Bedford YMCA Trade School are pro-

cessed, and provide basis for special analyses.
Duration: September 1962-September 1967.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)
Cooperating group(s): Bedford YMCA; New York State Employment Service.

17-Q-17 AN EVALUATION OF THE EAST HARLEM YOUTH EMPLOYMENT SERVICE

Purpose: To evaluate effectiveness of a special program for school dropouts developed by the East Harlem Youth Employment Service in conjunction with the New York State Division for Youth and the New York State Employment Service.
Subjects: Currently unemployable 16 to 18 year old school dropouts.
Methods: Data collected routinely from East Harlem Youth Employment Service are processed, and provide basis for special analyses.
Duration: August 1962-August 1967.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)
Cooperating group(s): East Harlem Youth Employment Service; New York State Employment Service.

17-Q-18 AN EVALUATION OF THE BUFFALO YOUTH AND WORK PROGRAM

Purpose: To evaluate effectiveness of a special program for school dropouts, developed by the Buffalo Youth Board in conjunction with the New York State Division for Youth and the New York State Employment Service.
Subjects: Currently unemployable 16 to 18 year old school dropouts.
Methods: Data collected routinely from Buffalo Youth and Work Program are processed, and provide basis for special analyses.
Duration: September 1962-September 1967.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)
Cooperating group(s): Buffalo Youth Board; New York State Employment Service.

17-Q-19 AN EVALUATION OF THE POLICE ATHLETIC LEAGUE YOUTH AND WORK PROGRAM

Purpose: To evaluate effectiveness of a special Police Athletic League program for school dropouts, developed in conjunction with the New York State Division for Youth and the New York State Employment Service.
Subjects: Currently unemployable 16 to 18 year old school dropouts.
Methods: Data collected routinely from the Police Athletic League are processed, and provide basis for special analyses.
Duration: August 1962-August 1967.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)
Cooperating group(s): Police Athletic League; New York State Employment Service.

17-Q-20 AN EVALUATION OF THE ROCHESTER YOUTH AND WORK PROGRAM

Purpose: To evaluate effectiveness of a special program for school dropouts, developed by the Rochester-Monroe County Youth Board in conjunction with the New York State Division for Youth and the New York State Employment Service.
Subjects: Currently unemployable 16 to 18 year old school dropouts.
Methods: Data collected routinely from Rochester Youth and Work Program are processed, and provide basis for special analyses.
Duration: April 1962-April 1967.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)
Cooperating group(s): Rochester-Monroe County Youth Board; New York State Employment Service.

17-Q-21 AN EVALUATION OF THE SYRACUSE YOUTH AND WORK PROGRAM

Purpose: To evaluate effectiveness of a special program for school dropouts, developed by the Onondaga County Youth Board in conjunction with the New York State Division for Youth and the New York State Employment Service.
Subjects: Currently unemployable 16 to 18 year old school dropouts.
Methods: Data collected routinely from Syracuse Youth and Work Program are processed, and provide basis for special analyses.
Duration: February 1962-February 1967.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)
Cooperating group(s): Onondaga County Youth Board; New York State Employment Service.

17-Q-22 AN EVALUATION OF THE URBAN LEAGUE YOUTH AND WORK PROGRAM

Purpose: To evaluate the effectiveness of the special Urban League program for school dropouts, developed in conjunction with the New York State Division for Youth and the New York State Employment Service.
Subjects: Currently unemployable 16 to 18 year old school dropouts.
Methods: Data collected routinely from Urban League are processed, and provide basis for special analyses.
Duration: October 1962-October 1967.
Investigator(s): Arthur Pearl, Ph.D., Center for Youth and Community Studies, Howard University, Washington 1, D. C. (formerly Director of Research, New York State Division for Youth, Albany 10, N. Y.)
Cooperating group(s): Urban League; New York State Employment Service.

EXCEPTIONAL CHILDREN

Retarded

17-S-1 COMMUNITY ACCEPTANCE OF THE RETARDED CHILD

Purpose: To examine attitudes of the public and of community leaders toward mentally retarded children in the community; to examine variables pertinent to the shaping of these attitudes.
Subjects: About 2500 interviews distributed among the following: (1) random sampling of the public in four cities of Washington State; (2) community leaders; (3) sampling of neighbors of families with a retarded child; and (4) parents of a retarded child and neighbor parents of a "normal" control child of same age and sex.
Methods: Direct interview guided by structured questionnaire and interview procedure.
Duration: June 1963-April 1964.
Investigator(s): R. S. Justice, M.S.W., Assistant Professor of Social Work, University of Washington School of Medicine, Seattle, Wash., and Theodore D. Tjossem, Ph.D., Special Assistant for Mental Retardation, Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare, Washington, D. C., 20201. (Formerly Assistant Professor of Pediatrics and Psychiatry, University of Washington School of Medicine.)
Cooperating group(s): Washington State Department of Health.
Publication: Plan publication in journals; possibly full study will be published in cooperation with Washington State Department of Health.

17-S-2 MENTAL RETARDATION IN VICTORIA, AUSTRALIA

Purpose: To discover number of mentally retarded children under age 16 in Victoria at the end of 1962, including children in institutions, those attending outpatient clinics, day training centers, and special schools. To assess facilities for these children.
Duration: 1963-1964.
Investigator(s): Cleo H. Macmillan, B.A., Research Assistant, Mental Health Research Institute, Parkville, N.2, Victoria, Australia.
Cooperating group(s): Victorian Council for Mental Hygiene.
Publication: Booklet and articles are planned.

17-S-3 IDENTIFICATION OF MILD RETARDATION IN FIRST TWO YEARS OF LIFE

Purpose: (1) To determine at what age and by what developmental signs one can detect the mild forms of retardation in the absence of specific physical signs; (2) to collect additional information about children of this category; and (3) to determine the value of early diagnosis.
Subjects: Children who show delayed motor, social, and language development in the first two years of life, excluding those children with clear-cut physical signs known to foreshadow retarded development.
Duration: April 1963-April 1966.
Investigator(s): Sonya Oppenheimer, Ph.D., Department of Pediatrics, and Jane W. Kessler, Ph.D., Director, Mental Development Center, Western Reserve University, Cleveland 6, Ohio.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

227

17-S-4 EPIDEMIOLOGY OF MONGOLISM AND CONGENITAL ANOMALIES OF THE CENTRAL NERVOUS SYSTEM IN VICTORIA, AUSTRALIA, 1942 TO 1962

Purpose: To establish an association between virus infection and Mongolism, and congenital CNS anomalies.
Duration: 1956-continuing.
Investigator(s): Alan Stoller, Chief Clinical Officer, Mental Health Authority, and Robin D. Collmann, Research Psychologist, Mental Health Research Institute, Victoria, Australia.
Publication: Numerous papers in medical journals.

17-S-5 CONGENITAL TOXOPLASMOSIS IN MENTAL DEFICIENCY

Purpose: To estimate the contribution of congenital toxoplasmosis to the pool of mental deficiency.
Subjects: Moderately and severely retarded children.
Methods: Survey conducted during administration of new skin test for detection of toxoplasmosis.
Duration: 1962-December 1963.
Investigator(s): Dr. David Pitt, Pediatrician, and Dr. Alice Garvan, Pathologist, Children's Cottages, Kew E.4, Victoria, Australia.
Publication: Medical Journal of Australia during 1964.

17-S-6 STRUCTURE AND PROPERTIES OF MONGOLOID GAMMA-GLOBULIN

Purpose: Immediate objective is to study ability of gamma-globulins in Mongoloids to function in the production of antibodies. Long-range goal is the elucidation of differences in structures of gamma-globulins of Mongoloids and normal controls.
Subjects: 70 Mongoloids, their parents and siblings in the first phase of study; Mongoloids and normal controls in the second phase.
Methods: Study of the concentrations and mobilities of gamma-globulins in the Mongoloids, parents and siblings; comparison of the structures of polypeptide fractions obtained from gamma-globulins of Mongoloids and those of normal controls.
Findings: Significant differences found in the structures of polypeptide fractions obtained from gamma-globulins of Mongoloids and those of normal controls.
Investigator(s): Gordon H. Pritham, Ph.D., Professor of Physiological Chemistry, and Malcolm Cronlund, Graduate Assistant, Pennsylvania State University, University Park, and Medical Staff, Selinsgrove State School and Hospital, Selinsgrove, Pa.
Cooperating group(s): Pennsylvania State Department of Public Welfare.

17-S-7 FAMILY FACTORS RELATED TO PLACEMENT OF MONGOLOID CHILDREN

Purpose: To examine characteristics, experiences, and attitudes of families with a Mongoloid child in the home; to seek significant factors which may suggest guides for counseling parents toward placement decisions which support favorable family functioning.
Subjects: Drawn from over 100 families with one Mongoloid child under nine years of age, living with both parents in metropolitan Newark, New Jersey; response rate over 70 percent.
Methods: Statistical comparison and factor analysis of social data and

223

parental responses to precoded interview schedule and attitude rating scales administered to mother and father separately. Rating of level of family functioning on standardized scale.
Duration: March 1963-February 1965.
Investigator(s): Nellie D. Stone (D.S.W. Candidate), Coordinator, Guidance Clinic of the Essex Unit, New Jersey Association for Retarded Children, 100 N. Arlington Ave., East Orange, N. J.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication planned in mental deficiency and social work journals.

17-S-8 MOTIVATIONAL FACTORS IN THE PERFORMANCE OF THE RETARDED

Purpose: Exploration of background and etiological, intellectual, and situational correlates of responsivity to social reinforcement.
Subjects: Normal and retarded children.
Methods: Learning and persistence measures of reinforcer effectiveness.
Findings: Social deprivation, M.A., and a variety of experimental manipulations affect social reinforcer effectiveness.
Duration: September 1962-September 1967.
Investigator(s): Edward Zigler, Ph.D., Associate Professor, and Earl C. Butterfield, Ph.D., Research Associate, Department of Psychology, Yale University, New Haven, Conn.
Cooperating group(s): Public schools and institutions for the mentally retarded in Connecticut, Massachusetts, Missouri, and Texas; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-S-9 DOMINANCE HIERARCHY OF A GROUP OF PROFOUNDLY RETARDED CHILDREN

Purpose: To describe the dominance hierarchy and the effects of psychopharmacologic drugs on the status ranking of profoundly retarded children.
Subjects: Six females, mean age 12 years, I.Q.'s less than 25.
Methods: Each subject is paired with his five peers (total of 15 pairs). Each pair is tested in a modified Wisconsin General Test Apparatus, sitting 36 inches apart, facing each other. A trial consists of placing a piece of popcorn midway between each subject and simultaneously raising the transparent panels directly in front of them. One minute is permitted for retrieval of the popcorn, and one score point is given for each retrieval. There are 16 trials per session, and 10 replications per phase. The effects of psychopharmacologic drugs are systematically tested between control phases.
Duration: July 1963-June 1964.
Investigator(s): John H. Hollis, M.S., Research Associate, and Pamela K. Gunnell, Bureau of Child Research, University of Kansas, Lawrence, and Parsons Research Project, Parsons State Hospital, Parsons, Kans.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Planned in *Journal of Abnormal and Social Psychology*, *American Journal of Mental Deficiency*, or *Child Development*.

17-S-10 VARIABLES UNDERLYING INSTITUTIONALIZATION OF MENTALLY RETARDED

Purpose: Determination of influents in the parental decision to commit

229

children to institutions for the retarded and especially to locate sources of influence where commitment is deemed inappropriate to the staff.
Subjects: Children under ten years of age committed, but not yet admitted, to a state hospital for the retarded.
Methods: Social work interview of parents and child, psychological testing of parents and child, physical and psychological examination of child.
Duration: June 1963-June 1965.
Investigator(s): V. A. Stehman, M.D., Deputy Director, Michigan State Department of Mental Health, Lansing 13, Mich., and Robert I. Jaslow, M.D., Superintendent, Plymouth State Home and Training School, Northville, Mich. (Reported by Gwen Andrew, Ph.D., Chief, Research Section, Michigan State Department of Mental Health.)
Cooperating group(s): Michigan State Department of Mental Health; Plymouth State Home and Training School; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Results will be published in a final report of the project.

17-S-11 OCCUPATIONAL TRAINING CENTER FOR THE MENTALLY RETARDED

Purpose: To develop an occupational and vocational habilitative program for retardates over 16 years of age by using, extending, and refining evaluation and training methods and techniques developed in such similar VRA-related projects as the MacDonald Training Center in Tampa, Florida.
Subjects: Intellectually handicapped, untrained adolescents and young adults.
Investigator(s): Dolores S. Benedict, Director, Palm Beach Habilitation Center, P. O. Box 1148, Lake Worth, Fla.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

Physically handicapped

17-T-1 BEHAVIORAL CLASSIFICATION OF NEUROLOGICAL PATIENTS

Purpose: To determine types of changes that have taken place in functional relations between behavior and its controlling variables in neurological patients. Eventually, to develop a classification of behavioral deficit in terms of developmental standards.
Methods: Study will consist of research in normal and abnormal infant behavior and mental development, with emphasis upon diseases of the child's nervous system. Established behavioral conditioning methods will be used and new techniques will be developed to assess behavior repertoires at different ages, from infancy through adulthood.
Investigator(s): Murray Sidman, Ph.D., Assistant Professor of Psychology, Department of Neurology, and Lawrence T. Stoddard, Assistant Psychologist, Massachusetts General Hospital, Boston, Mass.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-T-2 PERSONALITY DEVELOPMENT OF THE BLIND CHILD

Purpose: To determine the different kinds of impact observed to influence the personality development of blind children.
Subjects: Blind children in pediatric and psychiatric clinics, schools for the blind, institutions, and in their own homes.
Methods: Clinical observation, diagnostic testing in above settings plus interviewing and counseling parents.
Findings: A variety of influences within the family setting, including a wide range of parent reactions to the blindness of their child and its effects on the child's development will be evaluated.
Duration: 1940-1964.
Investigator(s): Anna S. Elonen, Ph.D., Professor of Psychology, and Albert C. Cain, Ph.D., Assistant Professor of Psychology and Psychiatry, University of Michigan, Ann Arbor, Mich.
Publication: One paper has been published in New Outlook for the Blind; another was presented at 1963 annual meeting of American Orthopsychiatric Association.

17-T-3 COGNITIVE FUNCTIONS AND SELF-ATTITUDES IN THE DISABLED

Purpose: To determine effect of congenital deafness on verbal behavior, verbal learning, concept formation, and judgment.
Subjects: Deaf subjects, 10 to 20 years of age; controls who are not deaf, in same age ranges.
Methods: Comparisons of deaf and normals are made on: (1) word association tasks; (2) measures of rote verbal learning; (3) tests of judgments concerning various types of relations among words; and (4) various measures of cognitive style characteristics.
Findings: (1) In verbal learning and in various types of word association tasks, the deaf rely heavily on morphological structure of words rather than on meaningful connections between words; (2) deaf subjects have very different word associations than normals as measured by a number of different association tasks and with respect to a large number of dimensions of association; and (3) deaf subjects are highly dependent on others in locus of control and locus of evaluation tasks.
Duration: July 1961-June 1964.
Investigator(s): Jum C. Nunnally, Ph.D., Professor and Head, and Richard Blanton, Ph.D., Associate Professor, Department of Psychology, Vanderbilt University, Nashville, Tenn.
Cooperating group(s): Wilerson Hearing and Speech Clinic; public schools in Tennessee; schools for the deaf in Kentucky and Tennessee; Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: A series of journal articles is being prepared.

17-T-4 PSYCHOLINGUISTIC BEHAVIOR OF DEAF CHILDREN

Purpose: To investigate linguistic functioning in deaf children in the following three areas: (1) development of word meanings; (2) development of word associations; and (3) acquisition of morphological habits that can be described in terms of grammatical rules. Area of investigation proposed is the study and development of tools and methods for assessment of linguistic functioning that will allow subsequent assessment and generation of normative data for the linguistic functioning of deaf children.
Subjects: Deaf children who have attained a reading grade of at least 1.5 and up, from schools for the deaf in the New York city area; hearing controls in

certain investigations.
Methods: Word comprehension tasks, both at expressive and receptive levels, and word association tasks at expressive levels will be administered. Ability to use words in their correct linguistic forms in sentences will be assessed by tapping the child's receptive and productive control of morphological habits that have been acquired.
Duration: January 1963-December 1965.
Investigator(s): Joseph Rosenstein, Ph.D., Director of Research, Lexington School for the Deaf, 904 Lexington Ave., New York 21, N. Y.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Planned in appropriate professional journals.

17-T-5 A PSYCHIATRIC STUDY OF KLINEFELTER'S SYNDROME

Purpose: To evaluate: (1) relationship between chromosomal aberrations, endocrine disturbances, physical changes, and self and social identity; and (2) effect of these upon social behavior.
Subjects: Adolescents aged 14 to 20 years, having small atrophic testis, nuclear chromatin positivity, an altered chromosome pattern, depressed or normal urinary 17-ketosteroids, and elevated urinary gonadotropins; control group matched for age, sex, and institutionalization or noninstitutionalization.
Methods: Three clinical interviews with subjects, with particular attention to emotional, psychosexual, and psychosocial development. Minnesota Multiphasic Personality Inventory, Thematic Apperception Test, and Projective Drawings Test administered to subjects.
Duration: Not reported-1964.
Investigator(s): Melvin Gravitz, Ph.D., Research Associate and Consultant in Clinical Psychology, James N. Kvale, B.A., Senior Medical Student, and Jacob Fishman, M.D., Assistant Professor of Psychiatry, College of Medicine, Howard University, Washington 1, D. C.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-T-6 STUDY OF PSYCHOSOCIAL ASPECTS OF THALIDOMIDE-INDUCED LIMB DEFORMITIES IN ONE HUNDRED FAMILIES IN MUNICH, GERMANY

Subjects: 100 families of children with thalidomide-induced limb deformities including phocomelia, radiusaplasia, and hypoplasia.
Methods: Unscheduled interview which is protocolled and later recorded according to a questionnaire. Children examined by means of the Griffiths Mental Development Scale, Gesell Developmental Schedules, and Minnesota Preschool Scale. Parents' reactions to deformity are studied, as well as their educational and child-rearing practices with the dysmelic child. Extent of treatment and professional help offered to parents ascertained. Other social influences upon parents also studied.
Findings: Little statistical correspondence between degree of motor handicap and mental development of the 60 children studied so far. Most predictive single variable is amount and quality of actual social interaction. Correspondence between educational techniques of the mothers and their psychic adaptational reaction to the handicap is well established.
Duration: January 1963-December 1965.
Investigator(s): Hellmut Strasser, Ph.D., Director, Research Department, Association for Mental Health, Widenmayerstrasse 24, Munich 22, Germany.
Cooperating group(s): Municipal Children's Hospital, Munich; Research Depart-

ment, Munich University Policlinic for Children; Dysmelia Center, University Children's Hospital, Munich; Association for the Aid of Crippled Children, New York.

17-T-7 THYROTOXIC CHILDREN, INDIVIDUAL AND FAMILY DYNAMICS

Purpose: To study and draw conclusions about character patterns and modes of interaction found in thyrotoxic children and their families, and to compare the children in their thyrotoxic state with the same children in a euthyroid state.
Subjects: Nine thyrotoxic children, hospitalized for metabolic studies while they were actively hyperthyroid; three former thyrotoxic patients, evaluated while euthyroid after treatment for thyrotoxicosis; parents of all 12 children.
Methods: All 12 children and their parents have been studied by careful psychiatric and psychiatric case work interviews. Nurses notes and observations and extensive psychological testing were used in analysis.
Findings: Preliminary impressions indicate that subjects do not have an exact, describable character structure common to all. However, several factors have turned up repeatedly. Children were consistently somewhat extreme in their reactions, being either very submissive or very rebellious, very rigidly conforming, or quite nonconforming, very active or very passive, with few in the mid-range while they were hyperthyroid. The thyrotoxicosis apparently acted somewhat like an increase of instinctual energy and children increased their own defensive patterns, exaggerating their usual character structures. Conflicts regarding dependency, aggression, strivings toward perfection, and need to control others were evident. Families were intensely ambitious or very hard working, usually rigid and conforming. Considerable emotional distance was found in the families, where often both parents worked and fathers were out of the home in the evenings. Parents were immature with personality growth arrested at early stages of development making it easy for them to use their children vicariously in their expectations. Parents themselves had major problems in communicating with appropriate effect, and were hindered by their fears of aggression and their many dependency needs. Psychological testing thus far has not shown any clear trends.
Duration: February 1962-July 1964.
Investigator(s): David F. Freeman, M.D., Clinical Assistant Professor, Department of Psychiatry, North Carolina Memorial Hospital, University of North Carolina, Chapel Hill, N. C.
Cooperating group(s): Department of Psychiatry, North Carolina Memorial Hospital; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted for publication.

17-T-8 COGNITIVE AND ATTENTIVE DEFICITS IN CHILDREN WITH TEMPORAL LOBE AND CENTRENCEPHALIC EPILEPSY

Purpose: To investigate psychoneurological disorders in children.
Subjects: Three patient groups (left temporal, right temporal, and centrencephalic) will be matched with a normal group with respect to I.Q. and age.
Methods: The subjects will be administered: (1) Wechsler Intelligence Scale for Children; (2) a test of sustained attention; (3) verbal and nonverbal (auditory and visual) tasks of immediate memory; and (4) learning and/or delayed memory tasks.
Duration: January 1962-January 1964.
Investigator(s): Paul Fedio (Ph.D. Candidate), Staff Psychologist, Handicapped

Children's Clinic, 19th and C Sts., S. E., Washington 3, D. C.
Publication: Planned in psychological journals.

17-T-9 AN EFFORT TO DETERMINE WHETHER IRREGULAR BRAIN WAVE PATTERNS OF EPILEPSY AFFECT CHILDREN'S MOTOR-SENSORY PERFORMANCE AND ATTENTIVENESS

Purpose: To study and quantify any decrease in perception, performance, and attention correlated with inter-ictal subclinical EEG abnormalities, namely bursts or spikes in epileptic children.
Subjects: Epileptic children with centrencephalic or temporal lobe seizures.
Methods: Simultaneous EEG and tests of auditory and visual recall, reaction time, continuous performance, and the Bourdon-Weismer Stipple Dot Test will be correlated and scored.
Duration: June 1962-June 1964.
Investigator(s): Gregory S. Ferriss, M.D., Marilyn M. Dorsen, M.A., and Robert Dorsey, Ph.D., School of Medicine, Louisiana State University, New Orleans, La.
Cooperating group(s): The Epilepsy Foundation.

17-T-10 REVISE AND RESTANDARDIZE A TEST FOR HANDICAPPED

Purpose: To revise the Hiskey-Nebraska Test of Learning Aptitude developed by the investigator in 1941 for use with young deaf children.
Subjects: Deaf, retarded, and normal groups of children and youth.
Methods: Items in the scale will be revised and modernized. New items will be added, thus extending the scale from the present 4 to 10 year range to a range of 3 to 16 years. All items will be tested on deaf, retarded and normal children and youth. After a tryout on deaf and hearing children, an item analysis will be made and final scale will be assembled. Revised scale will be standardized separately on deaf children and on hearing children.
Duration: February 1963-February 1965.
Investigator(s): Marshall S. Hiskey, Ph.D., Professor of Educational Psychology, Department of Neurology and Psychiatry, University of Nebraska College of Medicine, Omaha, Nebr.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

17-T-11 STANDARDIZATION AND VALIDATION OF A DIAGNOSTIC TEST BATTERY FOR LANGUAGE IMPAIRED CHILDREN

Purpose: To develop a battery of tests which will be clinically useful to determine conceptual and linguistic abilities of "aphasic children" said to be delayed in their development of language.
Subjects: 30 language-delayed children with neurological signs; 30 language-delayed children without neurological signs; and 30 normal children; all subjects ages 6 to 8.
Methods: Administration of various relevant tests to determine their usefulness in a diagnostic examination of children with language delays, and to provide standardization data on those which prove useful.
Duration: July 1962-June 1967.
Investigator(s): Joseph M. Wepman, Ph.D., Professor, Departments of Surgery and Psychology, University of Chicago, Chicago 37, Ill.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Relevant professional journals.

17-T-12 COMMUNITY PROGRAM OF ORIENTATION AND MOBILITY SERVICES FOR THE BLIND IN MISSOURI

Purpose: To effect and test establishment of a statewide program of orientation and mobility training for blind persons under auspices of a family centered casework agency.
Subjects: Young blind children and elderly blind persons.
Methods: Mobility training of young blind children to appraise ages at which various phases of travel training can suitably be introduced. Values of limited travel training for older persons and orientation training for recently blinded adults receiving post-blindness hospital care will be explored.
Duration: January 1963-December 1964.
Investigator(s): Thomas J. O'Donnell, John K. Rowland, Dudley L. Baker, and Thomas J. Murphy, Society of St. Vincent de Paul, 4140 Lindell Blvd., St. Louis 8, Mo.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

17-T-13 INTEGRATING THE HANDICAPPED CHILD INTO THE COMMUNITY CENTER

Purpose: To examine integration of handicapped children into play groups of nonhandicapped children; to explore and analyze techniques required to facilitate this process; to evaluate effect of integration program upon children, institution, and staff; to determine practicality of extending program to other centers.
Subjects: A group of 20 to 35 children, aged 5.5 to 13 years, diagnosed as orthopedically handicapped according to criteria of New York City Department of Health. Subjects are being integrated into the regular ongoing program of the Mosholu-Montefiore Community Center in Bronx, N. Y. (a member agency of the Associated YM-YWHA's of Greater New York).
Methods: Records, observations and Flannigan's Critical Incident Technique used during initial exploratory phase. Movement scales and sociometric devices to be developed. Categorization of unstructured interviews according to techniques developed by Richardson, et al., of the Association for the Aid of Crippled Children. A panel of parents (69 to 100 pairs) are being interviewed periodically over a five-year period to determine perception of changes in child's social behavior and development.
Duration: 1960-1966.
Investigator(s): Arthur Schwartz, M.S.S.S., Project Director, Marvin Lieberman, M.S.W., Project Coordinator, and Irene S. Cohen, M.S.S., Caseworker, Associated YM-YWHA's of Greater New York, 33 W. 60th St., New York 23, N. Y.
Cooperating group(s): Association for the Aid of Crippled Children; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Monograph by the author, 1962; article to appear in *Program Aids* (National Jewish Welfare Board), 1963; future articles as indicated, and a summarizing monograph at completion of study.

THE CHILD IN THE FAMILY

Family background and relations

17-U-1 RELATIONSHIP OF MATERNAL EMOTIONS DURING PREGNANCY TO LABOR AND DELIVERY AND TO POSTNATAL STATUS OF THE INFANT

Purpose: To test hypotheses concerning relationship between acute emotional stress during pregnancy and the psychosomatic functioning of the infant.
Methods: Inventory devised for assessment of maternal emotions during pregnancy; scores on inventory compared with obstetrical records on labor and delivery and on assessments of infant, including neurological examination and observations of infants' behavior in the nursery during first ten days of life. Cross-validating study on Dutch population will be made to check an earlier pilot study in which maternal emotions during pregnancy were found to be related to length of labor and (for primaparae) to lacerations during delivery.
Duration: January 1963-not reported.
Investigator(s): Earl S. Schaefer, Ph.D., Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-U-2 THE SOCIAL ADJUSTMENT AND ATTITUDES OF YOUNG TWINS

Purpose: To reveal influence of various types of siblings on child experience range, the stimulation, companionship, and degree of sex role reinforcement received; to reveal effects of sibling character on social and self attitudes, abilities, and skills the child acquires.
Subjects: Urban, white, native-born, 5 and 6 year old twins from two-child families; a matched singleton control group.
Methods: Study deals with inter-twin type and twin-singleton differences. The comparative singleton population was stratified in such a way as to make it possible to put the twins and sub-groups of singletons on a sib-age-difference continuum as well as match sub-groups of singletons on the sex of sib variable. As a by-product of the twin study, 50 twins prematurely born were matched individually with 50 born at term on zygosity, race, age, social class, sex of sib, and family complexity and intactness. A comparison of these two carefully matched groups on the basis of all measures used in the twin study should illuminate to some extent the question of effects of prematurity on child development.
Duration: Not reported-early 1964.
Investigator(s): Helen L. Koch, Ph.D., Professor Emeritus, Department of Psychology, University of Chicago, Chicago 37, Ill.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-U-3 CHILDREN WITH SCHIZOPHRENIC PARENTS

Purpose: To compare a group of children having at least one schizophrenic parent with a group of children whose families have no history of schizophrenia for past two generations. To observe conditions surrounding onset of schizophrenia; hopefully, to differentiate individuals who manifest schizo-

phrenia from those who do not by means of current assessment techniques.
Subjects: 200 children, 10 to 20 years of age, with mothers chronically and severely schizophrenic; control group of 100 children whose parents and grandparents had no psychiatric disturbances, matched for age, sex, socioeconomic status, and educational attainment.
Methods: Psychophysiological conditioning, stimulus and mediated generalization; psychophysiological response to mild stress; MMPI; WISC; specially devised association techniques; psychiatric interview; social development interview; school reports; adjective check lists.
Findings: Preliminary results: experimental group exceeds control group in response to stress, stimulus generalization, and time to recover from stress; no noticeable difference in intelligence between groups.
Duration: November 1962-not reported.
Investigator(s): Sarnoff A. Mednick, Ph.D., Associate Professor of Psychology, University of Michigan, Ann Arbor, Mich., and Director, Psychological Institute, and Fini Schulsinger, M.D., Chief Physician, Psychiatric Department, Kommunehospitalet, Copenhagen, Denmark.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-U-4 CHILD DEVELOPMENT FOLLOWING MATERNAL MENTAL ILLNESS

Purpose: To discover if there is an association between the fact of a child's mother being hospitalized for mental illness during the child's first 12 months of life and evidence of psychological maladjustment of the child at age 11 or 12.
Subjects: All children born alive within 12 months preceding hospitalization to a 40 percent systematic sample of all women, aged 15 to 44 inclusive, ever married, and admitted for the first time to public, private or Veterans Administration mental hospitals in Massachusetts during 1950. When originally assembled, this group contained 69 children. The comparison group consists of an equal number of children matched for live birth, age, place of birth, sex, age of mother, race of mother, and occupation of father. Selection of the control group was an otherwise random process of taking the next qualifying individual in the chronologically ordered registry of births in which each study case was found.
Methods: Written communication with appropriate school personnel regarding grade level at which child is functioning in terms of nationally standardized achievement test scores, and measurement of intelligence by group or individual intelligence tests. Academic functioning is used as an empirical indicator of psychological adjustment.
Investigator(s): Samuel G. McClellan, M.D., Research Fellow in Community Mental Health, School of Public Health, Harvard University, Cambridge, Mass. (Reported in Sources of Morbidity Data, 1962.)

17-U-5 CHILDREN'S RESPONSE TO PARENT SUICIDE

Purpose: (1) To trace the impact of a parent suicide, both in its immediate and long-term effects upon the suicide's children; (2) to map out the factors determining the various outcomes of such a family tragedy; and (3) to explore the possibilities such incidents contain for immediate preventive/therapeutic intervention.
Subjects: Initial subjects are inpatient and outpatient children seen at the Children's Psychiatric Hospital, University of Michigan Medical Center. At a later point, subjects are to be sought and included from nonclinical populations.
Methods: Essential approach is clinical, using the combined materials from

referrals, developmental histories, psychodiagnostic testing, psychiatric interviews plus, in a great many instances, notes from long-term extensive psychotherapeutic contact with the children.
Findings: Data analysis in early stages already shows the immense impact of parent suicide upon the child directly, and upon the child as effected by the suicide's impact upon other family members. The impact of attempts to evade or cover the suicide is noted, as is the frequent intention of the parent who committed suicide to have an effect upon one or more of the children surviving. The children's need to deny the nature of the death and the vicissitudes of their own guilt and varied defenses against the object-loss will be analyzed.
Duration: Summer 1962-fall 1963.
Investigator(s): Albert C. Cain, Ph.D., Assistant Professor of Psychology and Psychiatry, University of Michigan, Ann Arbor, Mich., and Irene Fast, Ph.D., Chief Psychologist, San Fernando Valley Child Guidance Center, 14852 Ventura Blvd., Sherman Oaks, Calif.
Cooperating group(s): Grant Foundation.
Publication: A brief article will probably be submitted to a child clinical journal; a longer version may be presented in prospective monograph on object-loss and bereavement.

17-U-6 FAMILY INTERACTION AND TYPE OF CHILD DISTURBANCE

Purpose: To compare three groups of parents on several behavioral indices of conflict, dominance, anxiety, overt and covert sex identification, and congruency in reporting how they would handle typical childhood problems.
Subjects: White, middle class husbands and wives with intellectually normal male children, aged 6 to 11. Clinic children have been referred for treatment of either conduct (essentially aggressive) or personality (basically over-inhibited) disturbances.
Methods: Three groups of families consist of Clinic-Conduct, Clinic Personality, and Non-Clinic control sample. Parents rate their children on a problem checklist, indicate privately how they would cope with 12 typical child misdemeanors, and fill out measures of overt and covert sex identification. Child then indicates how he believes each of his parents would handle the problem situation and is administered measures of sex typing and identification. Family phase follows in which parents publicly discuss how they would deal with half the problems; child is then included in discussion of remaining six problems.
Duration: September 1962-August 1964.
Investigator(s): Joseph Becker, Ph.D., Assistant Professor of Psychology, and Grant Fairbanks, Ph.D., Professor and Director of Speech Research Laboratory, University of Illinois, Urbana, Ill.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-U-7 FAMILY STRUCTURE AT A TIME OF REFERRAL TO A NAVY CHILD GUIDANCE CLINIC

Purpose: To investigate the relevancy of family or parental stress to the time of referral to a child guidance clinic. To define families applying to the Navy's first child guidance clinic.
Subjects: All families (N=56) applying to the Child Guidance Clinic, U. S. Naval Hospital, Oakland, California, December 10, 1962-March 15, 1963.
Methods: Comparison of findings from questionnaires, psychological tests, and clinical examination of both parents and child. This pilot clinic was utilized by older career Navy men who averaged more than 14 years of service and were senior petty or commissioned officers. Patients were most often the

oldest son. Most frequent complaints were behavioral problems of long standing and parents blamed themselves or others but not the child.
Duration: October 1962-July 1963.
Investigator(s): William J. Dickerson, M.D., 100 Sir Francis Drake, Kentfield, Calif. (formerly Director, Child Guidance Clinic, U. S. Naval Hospital, Oakland, Calif.)
Cooperating group(s): Bureau of Medicine and Surgery, Department of the Navy.
Publication: Manuscript submitted.

17-U-8 FAMILY LIFE EDUCATION AND GROUP WORK PROJECT

Purpose: To discover what impact educational and group work services with parents will have on juvenile delinquent behavior.
Subjects: Two experimental and two control groups of parents or responsible relatives of children under juvenile court supervision, selected randomly.
Methods: Biweekly formal educational classes on psychodynamic and sociocultural influences in development of the child. Alternate biweekly group work services. Measures to test knowledge, attitudes, and behavior used before and after treatment; two follow-up studies conducted six months and one year after treatment.
Duration: October 1962-October 1965.
Investigator(s): Bernard J. Coughlin, S. J., Phillip A. Fellin, and John P. O'Brien, School of Social Service, St. Louis University, St. Louis 8, Mo. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1962-63.)
Cooperating group(s): President's Committee on Juvenile Delinquency and Youth Crime.

Child rearing attitudes and practices

17-V-1 A CORRELATION STUDY OF CHILD-REARING ATTITUDES AND MARITAL SATISFACTION

Purpose: To investigate relationship between child-rearing attitudes and satisfaction with marriage.
Subjects: 120 married couples having children 6 months to 12 years of age.
Methods: Locke Marital Satisfaction Inventory and Terman Self-Rating Happiness Scale, correlated with Parental Attitude Research Instrument.
Duration: 1959-1963.
Investigator(s): Eleanore Braun Luckey, Ph.D., Professor and Head, and E. Duwayne Keller, Ph.D., Assistant Professor, Department of Child Development and Family Relations, University of Connecticut, Storrs, Conn.
Publication: Planned in professional journals.

17-V-2 CHILD REARING AND CHILD BEHAVIOR IN GREECE AND LEBANON

Purpose: To ascertain whether there are relationships between certain types of child rearing and characteristic behavior of children.
Subjects: Six and seven year old children in a Greek and a Lebanese village.
Methods: Mothers will be interviewed regarding their child-rearing practices, using the interviewing schedules developed in previous studies (see Research Relating to Children, Bulletin 16). Children's behavior will be observed in

playground or courtyard situations, and recorded following a classification scheme developed by the Whitings and associates at Palfrey House, Harvard University.
Duration: September 1963-June 1965.
Investigator(s): Edwin Terry Prothro, Ph.D., Director, Center for Behavioral Research, American University of Beirut, Beirut, Lebanon.
Cooperating group(s): Foundations' Fund for Research in Psychiatry.
Publication: Publication is planned in an American psychological journal.

17-V-3 FREEDOM IN MAKING PERSONAL DECISIONS AS PERCEIVED BY PUERTO RICAN NINTH GRADE GIRLS

Purpose: To investigate extent to which girls were achieving their developmental task of gaining independence from parents, using as a criterion the amount of freedom they perceived was allowed them in making personal decisions. Areas of decision-making considered were activities outside the home, peer relationships, handling money, and persons making decisions. Also studied were the girls' and mothers' perceptions of freedom as well as sources of disagreement.
Subjects: 750 ninth grade girls in 57 urban and rural, public and private schools of Puerto Rico; 167 mothers.
Methods: Variables explored were residence, socio-economic level, and age. Data were collected by a questionnaire for the girls in school and by personal interviews with the mothers in their homes.
Findings: Findings show that the families are restrictive. Girls' freedom to make decisions for their personal lives was below the level that a panel of judges had decided was desirable for girls of these ages. Parents made more decisions about boys and staying away from home than about friends, handling money, and activities. Disagreements were most frequent in boy-girl relationships and outside activities, and less frequent in relation to clothes and grooming, privacy, and handling money. Mothers reported fewer disagreements than did girls. Mothers believed that adolescent girls should be allowed more freedom in activities outside the home than the girls believed they were allowed, while the opposite was found in regard to freedom concerning persons making personal decisions.
Duration: Completed 1962.
Investigator(s): Maria Socorro Lacot, Doctoral Candidate, Iowa State University, Ames, Iowa. (Reported in Journal of Home Economics, March 1963.)

24

SOCIAL, ECONOMIC, AND CULTURAL INFLUENCES

17-W-1 THE FACTOR OF ALLOPSYCHIC ORIENTATION IN MENTAL HEALTH

Purpose: To construct a model of the interconnections between treatment of time, space, the strange, and the unknown in the wider culture, as mediated through the ways in which young children are reared and through specific media that have impact on the formation of children's allopsychic orientation, particularly mass media and formal school materials and practices, with special reference to individual differences in sensory-motor functioning under conditions of rapid change in cultural concepts of time and space.
Methods: Materials from five Pacific island cultures (Manus, Samoa, Arapesh, Iatmul, and Bali), for four of which there are materials from restudies which provide time depth on effects of cultural change, will be analyzed as an interconnected cluster and contrasted, individually and as a cluster, with materials on American Culture, particularly in regard to changes which have occurred in the last five years. Case history materials from the hypo- and hyper-acute, using different sensory modalities, combined with a comparison of educational practices in different modern societies and certain peasant societies undergoing rapid change will be used to illuminate the cultural materials. Research is expected to provide insight on redundancy requirements of whole cultures and on ways in which these requirements alter in changing cultures.
Duration: January 1962-June 1964.
Investigator(s): Margaret Mead, Ph.D., and Rhoda Metraux, Ph.D., American Museum of Natural History, 77th St. and Central Park West, New York, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-W-2 A RORSCHACH STUDY OF PERSONALITY AND CULTURE TRAITS--A CROSS-CULTURAL COMPARISON BETWEEN TWO GROUPS OF SIMILAR BIOLOGICAL DESCENT

Purpose: To explore the relation between personality traits and culture traits among people of a distinct population.
Subjects: Two groups, 15 males each, now 20 to 50 years of age. First group born and reared to at least age 15 in a remote mountain village in Italy; second group direct descendents of the Italian village population, born and reared in New York City.
Methods: Cross-culture and cross-personality comparison. Personality traits determined by means of the Rorschach, following Piotrowski. Culture traits determined by participant observation and following Linton.
Findings: Significant differences in personality traits between groups were found.
Duration: Not reported-February 1964.
Investigator(s): Leopold M. Macari (Ph.D. Candidate, New York University), 2430 Bronxwood Ave., Bronx 69, N. Y.
Publication: University Microfilms, Inc.

17-W-3 COURSE OF THE HUMAN SMILE AND VOCAL BEHAVIORS IN FOUR CHILD-REARING ENVIRONMENTS IN THE FIRST 18 MONTHS OF LIFE

Purpose: To examine the human smile and vocal behaviors in first 18 months

of life and to contrast effects of widely differing environmental conditions for adaptive and social learning.
Subjects: Approximately 700 Israel infants, aged 1 to 18 months, from residential, institution, day nursery, Kibbutz, and middle class town family environments.
Methods: Observation at a monthly birth anniversary by a woman not completely unfamiliar to the infants. Standard procedure of approach, observation, and recording employed.
Findings: Behavior categories proved quite reliable in use. Institution and day nursery subjects smiled at a later age and vocalized less frequently than Kibbutz and family subjects.
Duration: 1960-1965.
Investigator(s): Jacob L. Gewirtz, Ph.D., Research Psychologist, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.
Cooperating group(s): Department of Psychology, Hebrew University of Jerusalem; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Preliminary report to appear in B. Foss (Editor), Determinants of Infant Behaviour, Vol. 3, Wiley, New York 1964; monograph report to be published.

17-W-4 A STUDY OF CONCEPTUALIZATION AND CONCEPT MEANINGS AND COMPARISON OF THE CONCEPTUAL DEVELOPMENT OF CHILDREN AND YOUNG ADULTS FROM DIFFERENT LANGUAGE BACKGROUNDS AND NATIONAL CULTURES

Purpose: To examine developmental differences in semantic meaning among young children and adolescents and among subjects from different cultures; to develop methods for assessment of semantic meaning, particularly to apply Piaget's bivalent logic, if possible.
Subjects: 1000 adolescents in various secondary schools in the Zurich, Switzerland area. Later plan subjects 4 to 12 years old in Cambridge, Massachusetts area.
Methods: Two assessment methods: (1) an adaptation of Osgood's semantic differential technique; (2) an original method based on Piaget's two-propositional logic. Subsequent methods will probably be less verbally complex ones.
Findings: The logical method, involving multiple assessments of the semantic connotations of words, is definitely practicable and should yield results which can be contrasted with the semantic differential results for the same subjects and same words. Logical method has some serious limitations which appear to contraindicate its usage in present form for assessing semantic conceptualization as a process. Revision may be attempted.
Duration: January 1963-April 1965.
Investigator(s): Norman F. Watt, Ph.D., Assistant Professor of Clinical Psychology, Harvard University, Cambridge 38, Mass.
Cooperating group(s): Der Schweizerische Nationalfond; The Human Ecology Fund; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Article has been published in a German psychological journal--no reference yet available.

17-W-5 THE MIND-WORLD OF THE CHILD RELATIVE TO THE CONSUMER ROLE

Purpose: To explore the attitudes and knowledge of children about the consumer role.
Subjects: 60 upper-lower or lower-middle class children of normal or higher intelligence, equally divided into three age groups: 5, 7, and 9 years.

BEST COPY AVAILABLE 242

Each age group was composed equally of each sex, and was selected from one school age.
Methods: Procedure was basically clinical. Children were asked questions or given behavior situations in which they were to place themselves. They were encouraged to answer freely and talk as long as they wished. Answers and behavioral responses were compared for age and sex.
Duration: April 1962-January 1964.
Investigator(s): James Utah McNeal (Ph.D. Candidate), Lecturer, Department of Marketing, University of Texas, Austin, Tex.
Publication: Plan to report findings in psychological and marketing journals.

17-W-6 FACTORS RELATED TO THE EATING BEHAVIOR AND SELECTION OF AN ADEQUATE DIET OF GIRLS 12 TO 14 YEARS OF AGE

Purpose: To study physiological, psychological, and sociological factors possibly related to eating behavior and selection of an adequate diet.
Subjects: 140 girls, 12 to 14 years of age, controlled for chronological age, social status, and menarche.
Methods: Information obtained by questionnaire, by food intake records, activity records, certain physiological measurements, taste threshold tests, food enjoyment scales, nutrition knowledge tests, and inventories of values and psychological adjustment.
Findings: The intake of milk and carotene-rich and vitamin C-rich foods was low in relation to current recommendations. Girls did not tend to miss a great number of meals nor did they consume a large amount of snacks. Diets and eating behavior were significantly better during the winter than during the summer. Significant relationships: (1) knowledge of nutrition was favorably related to nutrition practices; (2) when health was considered important in selecting foods, diets tended to be adequate, but when status, sociability, independence, and enjoyment rated high in food selection, poor food practices resulted; (3) overweight and concern about overweight were found concurrent with poor food habits; (4) earlier and later maturation were positively related to poor eating behavior; (5) good family relations and personal adjustments seemed to accompany good eating behavior; (6) social status was positively related to good eating behavior. Sensitivity to the four basic tastes, level of activity, and employment of the mother outside the home were not significantly related to dietary adequacy.
Duration: Completed 1962.
Investigator(s): Maxine Armstrong Hinton, Doctoral Candidate, Iowa State University, Ames, Iowa. (Reported in Journal of Home Economics, March 1963.)

17-W-7 CHILDREN'S FAVORABLE ATTITUDES TOWARD THEIR SOCIO-CULTURAL ENVIRONMENT

Purpose: To gain an understanding of children's socio-cultural orientation as expressed by their concrete interests and attitudes toward their socio-cultural environment. This should aid in helping children direct their interests toward greater growth in mature and rewarding experiences, and should help in planning of school curriculums.
Subjects: 145 boys and 140 girls from sixth grade of two suburban public schools in Cincinnati; 99 percent native born, 70 percent Jewish, 27 percent non-Jewish white, and 3 percent Negro. Average C.A., 11 years 8 months; average M.A., on Otis Group Intelligence Scale, 14 years; socio-economic background on Sim's Score Card, just below "very high".
Methods: Children were asked to list all things and experiences that thrill, delight, and make them happy. Material was tabulated and arranged into separate tests for boys and girls; test was administered to another group of same grade and school during following year.

Findings: Results indicate that children of this age have definite interests and attitudes toward their socio-cultural environment. Boys and girls differ in many of their interests. Tests may also be used with disturbed children to find clues to their problems if they "hate" what most children "like much".
Duration: Not reported-July 1963.
Investigator(s): Rose Zeligs, Ed.D., Certified Psychologist, 14256 Ventura Blvd., Sherman Oaks, Calif.
Publication: Paper will be submitted to psychological or educational journal.

17-W-8 ATTITUDES OF YOUTH TOWARD AGED PERSONS

Purpose: (1) To develop and administer a scale to facilitate the study of attitudes of youth toward the aged. (2) To examine expressed attitudes concerning the aged in relation to certain variables.
Subjects: 400 high school and college students, from predominantly Protestant, intact, middle class, urban families.
Methods: Selected statements (negatively phrased) from the Tuckman-Lorge Old People Questionnaire and parallel positive statements formed the instrument. Chi-square test determined the significance of differences between responses of high- and low-scoring groups. Mann-Whitney U test determined relationship between attitude scores and age of respondent, degree of contact, and family structure. Kruskal-Wallis test determined relationship between attitudes toward the aged and age of parents, rural-urban residence, social class, maternal-child relations, self-concept, and childhood discipline.
Findings: More college women than college men had favorable attitudes toward the aged. High school girls whose homes did not include an aged member were more favorably oriented than were girls who lived with a grandparent. College men from intact families held more favorable attitudes than did men from broken families. Lower social class high school boys and upper middle class college women were more favorably inclined than representatives of other social classes. High school boys expressing satisfaction with self-concepts expressed more favorable attitudes than did those holding negative self-concepts. No significant relationships were observed between the attitudes and age of respondents, place of residence, or strictness of childhood discipline.
Duration: Completed 1962.
Investigator(s): Betty Lane, Doctoral Candidate, Florida State University, Tallahassee, Fla. (Reported in Journal of Home Economics, March 1963.)

17-W-9 SURVEY OF TEENAGE ATTITUDES AND INTERESTS: PART TWO

Purpose: To obtain accurate information with respect to societal and social attitudes of Jewish, non-Jewish, and nonwhite adolescents; to determine whether these attitudes are related to adolescent anxiety and, in the Jewish sample, to determine whether there is any relationship to the degree of Jewish identification.
Subjects: Approximately 313 Jewish adolescent boys and girls, and a minimum of 25 to 50 non-Jewish, nonwhite adolescents who are members of the lower class group.
Methods: Use of specially developed questionnaires which were tested in a pilot study two years ago. It is anticipated that electronic data processing will be employed in final analysis of data.
Duration: September 1962-spring 1965.
Investigator(s): Joel M. Carp, B.A., East Flatbush-Rugby YM-YWHA, Associated YM-YWHA's of Greater New York, 1127 E. 102nd St., Brooklyn, N. Y. 11236.
Publication: A report, several conference papers, and journal articles are planned.

17-W-10 CHOICE AND DIFFERENTIATION OF ADOLESCENTS' VALUES BEFORE AND AFTER ENTERING ADULT SOCIETY: THE PROCESS OF VALUE SOCIALIZATION

Purpose: To discover to what extent boys adopt values prevailing in their homes and how different values and identifications result in personal autonomy versus alienation and deviant behavior.
Methods: Subjects who were interviewed at adolescence reinterviewed after three to five years, in order to follow differentiation of values from adolescence to the adult role.
Duration: 1962-1965.
Investigator(s): Pertti Toukonaa and Yrjo Littunen, School of Social Sciences (Yhteiskunnallinen Korkeakoulu), Kalevantie 4, Tampere, Finland. (Reported in *Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency*, Summer 1963).
Cooperating group(s): Research Institute of the School of Social Sciences; Kanslaiskasvatuksen Keskus (Central Organization for Education in Citizenship).

17-W-11 CORRELATES AND EFFECTS OF ETHNIC GROUP IDENTIFICATION

Purpose: To explore possible relationships among such variables as self-concepts, levels of ethnic group esteem, ethnic anxiety, contact with whites, aspirations, and academic achievement of Negro adolescents.
Subjects: 311 Negro adolescents enrolled in three integrated San Francisco Bay area high schools in the same district. Sample contained 148 males and 163 females, all with I.Q. scores above 90 on the Henman-Nelson test.
Methods: Basic questionnaire and a series of 9-item Guttman scales generated for the purposes of this study.
Findings: Favorable self-concepts were found to be related to higher aspirations and greater academic achievement. Ethnic anxiety (concern over one's status as a Negro) was negatively related to self-perceptions and aspirations. Negro adolescents with white friends evidenced high levels of aspiration and higher levels of academic achievement, etc.
Duration: October 1962-July 1963.
Investigator(s): T. Bentley Edwards, Ph.D., Professor of Education and Staten W. Webster, Ph.D., Supervisor of Teacher Education, University of California, Berkeley 4, Calif.
Cooperating group(s): Richmond Union High School District; Computer Center, University of California, Berkeley; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Four articles have been submitted for publication.

17-W-12 EMPLOYMENT OPPORTUNITIES OF NEGRO AND WHITE YOUTH

Purpose: To study earnings and employment opportunities of Negro and white high school graduates.
Subjects: 1,044 1960 graduates of Carver and Mergenthaler vocational high schools, selected for the extreme racial homogeneity of the schools. Mergenthaler has less than two percent nonwhite students and Carver is 100 percent nonwhite.
Methods: Analysis of earnings and employment data obtained from Social Security Administration work history records. Data obtained for all the graduating classes during the last five years at the two schools.
Findings: In the first year following graduation, median weekly earnings are approximately $11 for nonwhite females, $50 for white females, $22 for nonwhite males, and $38 for white males. During the first year, only one in four nonwhite females is regularly employed; only one in two nonwhite males

is regularly employed; and three in four white males and females are regularly employed. Within three months after graduation, white females are employed at a rate of 90 percent, nonwhite females around 40 percent, nonwhite males 72 percent, and white males 87 percent. One year before graduation, 50 percent of the white females are engaged in some paid work, contrasted with 15 percent of the nonwhite females. Among regularly employed workers, the ratio of earnings for nonwhite graduates relative to white graduates does not exceed 70 percent.
Duration: January 1962-November 1965.
Investigator(s): Bernard Levenson, Ph.D., Lecturer and Research Associate, Department of Social Relations, Johns Hopkins University, Baltimore, Md., 21218.
Cooperating group(s): Baltimore City Equal Opportunity Commission; Social Security Administration, U. S. Department of Health, Education, and Welfare.
Publication: Initial interim report; plan to publish some results in late 1964.

246

HEALTH SERVICES AND SURVEYS

17-X-1 A PILOT STUDY OF INFANT MORBIDITY AND MORTALITY AMONG ESKIMOS IN THE BETHEL AREA OF ALASKA

Purpose: (1) To determine, with accuracy, infant birth and mortality rates, and to obtain information on incidence of prematurity in a remote Eskimo population; (2) to obtain basic data on the third trimester of pregnancy, birth practices, infant growth and development characteristics and nutritional patterns, and to maintain surveillance of infant morbidity patterns. Data are gathered in order to evaluate what role these conditions may play in the overall high mortality rate (estimated at 145/1000 for Bethel area Eskimos 1956-58).
Subjects: All infants born into the 27 Eskimo villages in the Bethel area over one year period, and mothers of these infants. Total infant population will contain more than 300 individuals. The total population of the 27 villages approaches 6,000 (1960).
Methods: Study is conducted as a longitudinal health survey, involving trimonthly visits of four research nurses to all study villages. During the visits, data are obtained by examination and measurement of study infants, and by interview and examination of mothers. Eskimo aides are located permanently in each village to assist with the investigations. Morbidity data are also acquired from existing records of clinic visits, hospitalization, and radio clinic reports.
Duration: October 1960-December 1962.
Investigator(s): James E. Maynard, M.D., 4304 Adelaide St., Oakland 19, Calif. (Reported in Sources of Morbidity Data, 1962.)
Cooperating group(s): Arctic Health Research Center, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Final publication plans have not yet been formulated; however, a preliminary report (September 1961) is available from the Epidemiology Section, Arctic Health Research Center.

17-X-2 PRESCHOOL SCREENING PROJECT

Purpose: To detect amblyopia ex anopsia, hearing loss, dental caries, and behavioral problems among children screened, and to refer these children for dental and/or medical attention. To inform and educate parents of children screened at the clinic as to the importance of good health practices in maintaining the health of their children.
Subjects: Four year old children.
Methods: Interviewing and testing.
Investigator(s): Dwight M. Bissell, M.D., City Health Officer, 151 West Mission St., San Jose, Calif; R. C. Miller, M.D., Assistant City Health Officer and John Hayakawa, Chief Public Health Educator, San Jose Health Department, San Jose, Calif. (Reported in Sources of Morbidity Data, 1962.)
Cooperating group(s): San Jose Health Department.

17-X-3 AN AUDIO-VISUAL TEST FOR EVALUATING ABILITY TO RECOGNIZE PHONETIC ERRORS

Purpose: To prepare an audio-visual test to ascertain reliability of speech clinicians and researchers in recognizing phonetic errors in children's speech.

Subjects: Three groups as evaluators of films: (1) 50 experienced speech clinicians; (2) 50 seniors majoring in speech and hearing; and (3) 50 classroom teachers.
Methods: Subjects given test for Film A under audio-visual and audio-only conditions. For Film B, only audio-visual condition used. Test scores determined in relation to "correct" agreements with an empirical answer sheet. Scores compared for following conditions: isolation, phrases, and trios; and audio-visual vs. audio-only for Film A.
Duration: January 1963-June 1964.
Investigator(s): Ruth Beckey Irwin, Ph.D., Professor of Speech, Ohio State University, Columbus 12, Ohio.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report to Cooperative Research Branch, Office of Education; journal article anticipated.

17-X-4 IMMUNIZATION STUDY OF NORTH CAROLINA FIRST GRADE SCHOOL CHILDREN

Purpose: To determine efficiency of existing immunization programs on the basis of school records; to evaluate adequacy of school records system regarding immunization; to evaluate effectiveness of existing laws and regulations regarding immunization and school records of immunization.
Subjects: North Carolina first grade school children.
Methods: Local health department nurse delivers forms to first grade teachers, instructs teachers as to proper completion of forms, returns at later date to collect forms, and returns them by mail to State Board of Health.
Duration: September 1961-May 1962.
Investigator(s): Theodore Scurletis, M.D., Pediatric Consultant, and Harold Sauls, Biostatistician, North Carolina State Board of Health, Raleigh, N. C. (Reported in Sources of Morbidity Data, 1962.)
Cooperating group(s): North Carolina State Board of Health.

17-X-5 MENTAL HEALTH OF A GROUP OF SCHOOL CHILDREN IN STIRLING COUNTY

Purpose: To assess mental health of children in community where mental health of adults has been studied. To compare some of these children with their parent(s) who were in the adult study.
Subjects: All children in a consolidated school, grades 3 to 12.
Methods: California Test of Personality; modification of health questions used for adults; teacher interviews.
Duration: 1955-1964.
Investigator(s): Dorothea C. Leighton, M.D., Senior Research Associate, and Laurel Hodgden, Ph.D., Research Associate, Cornell Program in Social Psychiatry, Cornell University, Ithaca, N. Y.; and Janice Ross, Ph.D., Associate Professor of Psychology, University of Saskatchewan, Sask.
Cooperating group(s): Association for the Aid of Crippled Children.
Publication: Will probably be reported as a paper.

17-X-6 EARLY DETECTION OF POTENTIAL REFERRALS FOR PSYCHOLOGICAL SERVICES

Purpose: To develop a battery of screening devices to adequately identify future referrals of students with psychological problems.
Subjects: Kindergarten pupils having entered school in fall of a given school year. Initial pilot study comprised 33 pupils; full-scale investiga-

BEST COPY AVAILABLE

tion will include approximately 150 pupils.
Methods: Screening battery consisting of clinical interview, Bender Visual Motor Gestalt, Draw-a-Person, dominance tests (eye-hand-foot coordination), summary sheet of significant information, teacher opinion (ranking), and Wide Range Achievement Test (reading grade only). Annual follow-up studies are planned.
Duration: September 1963-spring 1965.
Investigator(s): Rudolph F. Wagner (Ph.D. Candidate), Chief Psychologist, Richmond Public Schools, 809 E. Marshall St., Richmond 19, Va.
Publication: Results of pilot study will be available in mimeographed form by summer 1964; full report is planned.

17-X-7 KING CITY FAMILY HEALTH STUDY

Purpose: To measure variables related, or thought to be related, to the development of atherosclerotic heart disease in all members of selected families, and to compare the inter- and intra-familial aggregation of these factors in the first group selected from the King City Union High School district. In the second group, purpose was to ascertain clinical cases of atherosclerotic heart disease, using the Southern Monterey Medical Clinic facilities.
Subjects: Group 1: all families residing in King City Union High School district who have a child enrolled in high school during course of the study. Group 2: all persons residing in Southern Monterey County Hospital service area.
Methods: Interview, examination, and existing records used for both groups.
Investigator(s): L. Hughes Andrus, M.D., and David C. Miller, M.D., Southern Monterey County Medical Clinic; Reuel A. Stallones, M.D., Associate Professor of Public Health, School of Public Health, University of California, Los Angeles 24, Calif. (Reported in Sources of Morbidity Data, 1962.)

17-X-8 INFLUENCE OF AIR POLLUTION ON HEALTH AND PATTERNS OF RESPIRATORY ILLNESS IN CHILDREN AND STUDENT NURSES

Subjects: Elementary school children in several Los Angeles schools and student nurses in three hospitals.
Methods: Interview and daily questionnaires regarding symptomatology in the nurses, and from the schools by special records completed by the nurse.
Duration: July 1961-1965.
Investigator(s): Paul F. Wehrle, M.D., Professor of Pediatrics, and Bernard Portnoy, M.D., Assistant Professor of Pediatrics, School of Medicine, University of Southern California, Los Angeles, Calif. (Reported in Sources of Morbidity Data, 1962.)

17-X-9 RELATIVE ROLES OF THE PUBLIC HEALTH NURSE AND THE PHYSICIAN IN PRENATAL AND INFANT SUPERVISION

Purpose: To establish what part of the physician role in prenatal and well-baby care can be provided by a public health nurse working in a group practice setting in association with physicians, and whether this is acceptable to those involved. To determine difficulties and obstacles encountered in such a program, and to determine variation in utilization of professional services.
Subjects: Pregnant women who are members of the Montefiore Medical Group,

and the children they bear.
Methods: Random samples with a control group, observed and cared for by public health nurse in prenatal and well-baby services of Montefiore Medical Group.
Duration: July 1963-June 1967.
Investigator(s): George A. Silver, M.D., Chief, Division of Social Medicine, Montefiore Hospital, Gun Hill Rd., New York 67, N. Y.
Cooperating group(s): Health Research Council; Montefiore Medical Group.

17-X-10 A STUDY OF A CASE OF PSEUDO-DEFICIENCY

Purpose: To determine the long-range effect of an improper diagnosis and subsequent treatment of a child believed to have had phenylketonuria.
Subjects: A young child who was incorrectly diagnosed and treated for PKU for three years.
Methods: Case study of effects of a therapy program designed to overcome ill effects on child's physical, emotional and mental development.
Duration: 1961-1965.
Investigator(s): Bettie Arthur, Ph.D., Instructor in Psychiatry, School of Medicine, University of Michigan, Ann Arbor, Mich.
Publication: Publication is planned.

17-X-11 A MENTAL HEALTH CENTER FOR DISTURBED BLIND CHILDREN

Purpose: To translate knowledge of the psychology of blind and severely visually impaired children and the psychopathology of their disturbed states into usable diagnostic, therapeutic, educational, and casework methods.
Subjects: Emotionally disturbed, retarded, brain-damaged, and multiply handicapped blind children to age 21 and their families from all parts of the United States.
Methods: Diagnostic test construction; standardized and free associative interviews; analysis of psychotherapy sessions; experimental teaching techniques; motion picture studies of disturbed behavior, learning, interpersonal relations, motility and mannerisms, multiple disabilities; demonstration clinics.
Duration: October 1962-September 1965.
Investigator(s): Walter Kass, Ph.D., Director, Mental Health Center for Disturbed Blind Children, Jewish Guild for the Blind, 1880 Broadway, and Associate Professor; Arthur E. Gillman, M.D., Assistant Professor, Albert Einstein College of Medicine, Yeshiva University, New York, N. Y.
Cooperating group(s): Bureau for Education of the Visually Handicapped, New York City Board of Education; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Findings to be presented at professional meetings and to be published.

17-X-12 WAITING LIST DROPOUTS IN A CHILD GUIDANCE CLINIC

Purpose: An exploratory analysis of differences between "dropouts" and "continuers" on the clinic waiting list which alone, or in combination with factors in agency processes, contribute to initial acceptance and later refusal of service.
Subjects: 100 consecutive cases drawn from agency files which had accepted or refused service when it was offered.

Methods: All cases were tabulated for 14 factors. Families who refused treatment were contacted for personal interviews and a schedule was completed where contact was made. Of the 55 families who refused treatment, 43 were seen personally and 4 completed the schedule by mail. Results were evaluated and tentative findings written for agency use.
Findings: Due to small number of cases, only highlights were found. Families waiting 6 to 12 months tended to accept treatment, as did parents of 11 to 16 year olds, and parents of youngest children. Also, families in higher or lowest socio-economic categories and those having only one parent in the home tended to be more accepting of treatment. Refusals were more apt to come from school referrals and from parents of children with retardation or psychosomatic difficulties. In a large number of cases, parents did not understand function of the clinic, its procedures or methods. Communication seemed a problem in many refusals. An expanded study of 300 cases will cover period June 1963-June 1966.
Duration: March-July 1962.
Investigator(s): Robert S. Adams, M.D., Psychiatrist-Director, Bernice G. Sherlock, M.S.W., ACSW, Chief Psychiatric Social Worker, Mary Elizabeth Sterling, M.A., ACSW, Psychiatric Social Worker, and Howard M. Weinick, Ph.D., Chief Psychologist, Child Guidance Clinic of Waterbury, Inc., 52 Pine St., Waterbury 10, Conn.
Cooperating group(s): Connecticut Department of Mental Health; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Planned in professional journal.

17-X-13 A STUDY OF DENTAL HEALTH RELATED TO SOCIO-ECONOMIC LEVEL

Subjects: Three groups of children, ages 6 to 12 years, equally divided into high, middle, and low socio-economic groups (N=801). Also included are two groups of 250 children each in adequate fluoride and low/nonfluoride towns.
Methods: Children are given oral examinations by a pedodontist and an orthodontist; statistical analysis of results.
Duration: March 1960-November 1962.
Investigator(s): C. R. Castaldi, D.D.S., Professor of Pedodontics, William A. Quigley, D.D.S., Professor of Orthodontics, University of Alberta; and W. Zacherl, D.D.S., D.D.P.H., Dental Health Officer, City of Edmonton, Alta.
Publication: Journal of Dental Research, July-August 1961; publication planned in Canadian Journal of Public Health. (Reported in Sources of Morbidity Data, 1962.)

17-X-14 EFFECT OF FLUORIDE TABLET ADMINISTRATION

Purpose: To test effectiveness of fluoride tablet administration to children in two communities with no public water supply.
Subjects: Children of grade school age and preschool age in the two communities, whose parents desired to cooperate.
Methods: Tablets administered during school year in conjunction with school lunch program. Parents were responsible for giving tablets to preschool children, and school age children during school holidays. Baseline examination including bite-wing X-rays provided the control. Children re-examined semi-annually.
Findings: An average Def rate of 2.8 for 29 children under 8 years of age and an average DMF rate of 3.9 ranging from 3.0, at age 8 to 6.3 at age 14, among 44 children aged 8 to 14. Family histories showed several had originated from fluoridated areas. Filling needs met averages of 36 percent for permanent teeth and 8 percent for deciduous.

Duration: January 1963-1966.
Investigator(s): Michael Arra, D.D.S., Director of Dental Health, and C. W. Lemke, M.S., Statistician, Wisconsin State Board of Health, Madison, Wis.
Publication: Information regarding progress available upon request to principal investigator.

SOCIAL SERVICES

17-Y-1 LOCAL AREA STUDY AND DEMONSTRATION PROJECT

Purpose: To design and test a method of combined study of the needs of children and youth, including health, welfare, education, mental health, delinquency, employment, and leisure time; to design a practical program of services to meet them.
Subjects: Two local areas in the Commonwealth of Massachusetts, each containing 30,000 to 35,000 children.
Methods: Service and area unit profiles, interviews with population samples, case analyses, statistical analysis.
Duration: February 1962-1967.
Investigator(s): John E. Jacobi, Ph.D., Project Director, Massachusetts Committee on Children and Youth, 9 Newbury St., Boston 16, Mass.
Cooperating group(s): Statewide and local voluntary agencies; State and local departments and units of government; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

17-Y-2 CHILD WELFARE SERVICES RESEARCH: UNMARRIED MOTHERS WHO KEPT THEIR BABIES

Purpose: (1) To increase knowledge about unmarried mothers who, after initial consideration of relinquishment, decided to keep their babies; (2) to assess the care of the child and situation of the mother approximately three years after birth of child; and (3) to determine conditions and situations under which mothers have given good care to the children and have satisfactory lives of their own.
Subjects: 290 unmarried mothers who in 1959 and 1960 asked help of the Children's Home Society and the Los Angeles County Bureau of Adoptions in providing adoption for their children, received casework services, and then decided to keep their child. Follow-up of these mothers and children in 1963 appears likely to yield information on two-thirds of the cases.
Methods: Case record reading of 290 cases of mothers who kept their infants, casefinding of the mothers, interviewing those mothers who were found and were willing to be interviewed, questionnaires to those living out of state; second-hand information from relatives and agencies. Follow-up study is related to a doctoral thesis at the School of Social Work, University of Southern California, on a comparative record study of 100 mothers who decided to relinquish their children for adoption and 100 who decided to keep them. These latter 100 cases are included in the population.
Duration: April 1962-December 31, 1963.
Investigator(s): Elisabeth R. Frank, Ph.D., Research Director, and Helen R. Wright, Ph.D., Social Research Consultant, Children's Home Society of California, 3100 W. Adams Blvd., Los Angeles, Calif.
Cooperating group(s): Children's Home Society of California; Los Angeles County Bureau of Adoptions; California State Department of Social Welfare.
Publication: Data and results will be published in 1964.

17-Y-3 COMMUNITY SERVICES FOR THE UNWED PREGNANT ADOLESCENT

Purpose: To provide a comprehensive community program, including educational, medical, and mental health services for unwed pregnant adolescents remaining

at home during pregnancy.
Subjects: Selected number of girls in elementary school, aged 11 to 15 years, who have not reached the seventh month of pregnancy at point of project admission.
Methods: Initial psychological, psychiatric, and social casework evaluations of each participant. Ongoing evaluations, including teacher's assessment of academic achievement. Follow-up studies to evaluate participant's adjustment after leaving project. Constant ongoing evaluations by staff of techniques used in services offered to determine which are most effective. Detailed records kept of all aspects of the service program.
Duration: February 1963-January 1966.
Investigator(s): Harold M. Visotsky, M.D., Director, Illinois State Department of Mental Health, 54 W. Hubbard St., Chicago, Ill.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Final report to National Institute of Mental Health; other plans uncertain.

17-Y-4 THE UNMARRIED FATHER: DEMONSTRATION AND EVALUATION OF AN ASSERTIVE CASEWORK APPROACH

Purpose: To ascertain the validity of including putative fathers in a structured casework service. Specifically, to determine: (1) availability of putative father for casework interviews; (2) effect of proposed casework relationship on unwed girl; (3) extent of financial contribution by putative father; (4) effect of putative father involvement on child's future; and (5) profile of putative father.
Methods: Cases in which putative father participated in casework program compared and contrasted with those in which the unmarried father was not reached. Standardized case recording, psychological testing, and attitude measures employed to evaluate program.
Duration: June 1963-May 1966.
Investigator(s): Reuben Pannor, M.S., District Director, Vista Del Mar Child Care Service, 3200 Motor Ave.; Fred Massarik, Ph.D., Director, and Eugene Bender, Research Associate, Research Service Bureau, 590 N. Vermont, Los Angeles, Calif.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

17-Y-5 COMMUNITY SHELTER CARE PROJECT

Purpose: To identify children needing emergency shelter care; to study characteristics of these children and their families; to facilitate planning and recommend more systematic arrangements for emergency care; to suggest procedures to reduce number of children requiring emergency care.
Subjects: Children referred for emergency shelter to various voluntary and public agencies in greater Boston.
Methods: (1) Services: Community Shelter Care Project to serve as central agency through which referrals for and data about emergency placement will be channelled. Three local agencies will provide immediate receiving facilities for children referred to them by the Project. Ongoing planning to be carried out by receiving agency in cooperation with other community agencies when indicated. Report on progress and disposition from receiving agency to Project. (2) Study method: development of referral and admission forms, and schedules, tailored to the agency. Pretesting of forms and procedures on limited number of hospital social service cases and through discussion with workers from other potential sources of referral and receiving agencies.

Visits to selected communities which have a shelter facility or systematic programs for emergency shelter care.
Duration: January 1964-January 1966.
Investigator(s): Rose Bernstein, M.S., M.S.S., Director, Community Shelter Care Project, 161 S. Huntington Ave., Boston, Mass. 02130.
Cooperating group(s): Eleven public and voluntary child placement agencies; Permanent Charities Fund.

17-Y-6 SOCIAL AND ECONOMIC FACTORS INVOLVED IN EMERGENCY PLACEMENT OF DEPENDENT CHILDREN IN THE DISTRICT OF COLUMBIA JUNIOR VILLAGE

Purpose: To investigate social and economic factors of the families of the destitute, homeless, and inadequately parented children receiving temporary shelter care in D. C. Junior Village in calendar year 1962. It is hoped that material collected will be useful in community planning and in furthering the rehabilitation of the individual families involved through cooperative planning with appropriate community social agencies.
Methods: Areas such as employment, earning capacity, education, housing, health, and family stability will be explored, analyzed, and appraised to determine what supportive services the community had or might have offered to these marginally stable families to have obviated or minimized the necessity of emergency shelter care. Small group of caseworkers, functioning as case analysts after a period of intensive orientation, will attempt to locate and interview all significant members of the families, randomly sampled from those whose children were admitted to D. C. Village, but where juvenile court action in regard to parental custody was not deemed necessary. A special case record instrument is being designed.
Duration: April 1963-June 1964.
Investigator(s): Kathleen M. Jackson, M.A., Assistant Professor, Howard University School of Social Work, Washington 1, D. C.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

17-Y-7 PRELIMINARY STUDY OF 24 HOUR PROTECTIVE SERVICES AND SHELTER CARE

Purpose: Complaints of alleged child neglect and/or cruelty and abuse usually come to police attention in communities without social services available on a 24 hour basis. This has resulted in (1) young children being removed from their homes when immediate social services could have avoided their removal; (2) children left in unsatisfactory or dangerous home situations due to lack of shelter care facilities and/or inevitable delay court action; and (3) many cases unnecessarily referred to court without initial efforts to effect satisfactory adjustment without court action. This project will attempt to locate communities which have 24 hour casework service and explore their experience with regard to initial procedures, shelter care, and court referral practice.
Duration: September 1962-August 1963.
Investigator(s): Sherwood Norman, Director of Detention Services, National Council on Crime and Delinquency, 44 E. 23rd St., New York 10, N. Y. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Summer 1963.)

17-Y-8 CHILD WELFARE PROJECT

Purpose: (1) To study social and psychological problems of children in public care, whether in homes or hospital; (2) to study children's institutions and their functioning.
Subjects: Mentally subnormal children at home and in hospital; normal children in institutions and foster homes.
Methods: Observation, standardized interviews, questionnaires, and tests.
Duration: January 1963-1968.
Investigator(s): Jack Tizard, Ph.D., Medical Research Council, 49 Wellington St., London, W. C. 2, England.
Cooperating group(s): Association for the Aid of Crippled Children.
Publication: Papers to be published as results accrue.

17-Y-9 STUDY OF THE MENTAL HEALTH NEEDS AND PREVENTIVE INTERVENTION POTENTIALS OF PUBLIC CHILD DAY CARE CENTERS

Purpose: To explore the mental health needs of children and families using public child day care centers in Berkeley, California; to strengthen the service at point of entry and develop and test screening and predictive instruments to spot emotionally disturbed children, who can later be followed in the public school system.
Subjects: Population drawn from approximately 300 children in six day care centers and their families.
Methods: Direct observation at the centers, discussion and consultation with staff, collaboration with mental health consultants, and some direct work with families in their homes. Preliminary study should lead to a specific demonstration-research project in preventive intervention.
Duration: Not reported-June 1964.
Investigator(s): Lydia Rapoport, M.S.S., Lecturer in Social Welfare, University of California, Berkeley 4, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-Y-10 MAGNITUDE AND SCOPE OF FAMILY DAY CARE PROBLEM IN NEW YORK CITY

Purpose: To provide quantitative and descriptive data on the problem of unsupervised family day care arrangements in New York City. To determine suitability of care that is being given in family day care homes and to study characteristics of families using the care.
Methods: 1960 census tract data is employed to obtain stratified cluster sample survey to identify families using and providing family day care; concentrated effort is made in areas where it is likely that family day care is most prevalent. Demographic, social, and economic description is made of families involved, and homes are evaluated in reference to standards of adequate day care. Assessment is made of outstanding social characteristics and needs of families receiving care.
Duration: April 1963-March 1966.
Investigator(s): Elizabeth A. Vernon, Chief, Division of Day Care, Day Camps and Institutions, and Sylvia F. Hunter, Research Assistant, New York City Health Department, 100 Centre St., New York 13, N. Y.
Cooperating group(s): Medical and Health Research Association; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

17-Y-11 COST ANALYSIS OF DAY CARE CENTERS

Methods: Survey of approximately six day care centers in the Boston area. Information concerning organizational structure, programs, volume of service and costs, and characteristics of clients served, used as basis for comparative analysis of costs as related to variations in all above categories. Detailed time study conducted in one agency to obtain more precise data on elements of cost.
Duration: 1964-not reported.
Investigator(s): Arnold Gurin, M.S., Associate Professor of Social Administration, and Doris S. Fraser, M.S.S.S., Research Associate, Florence Heller Graduate School for Advanced Studies in Social Welfare, Brandeis University, Waltham 54, Mass.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Final report will include an exposition of methods of cost analysis in day care centers which can be used as a guide for agencies desiring to make similar analyses.

17-Y-12 FACTORS AFFECTING THE OUTCOME OF LONG-TERM FOSTER CARE

Purpose: To assist child care agencies in improving their management of long-term foster care children by deriving early indicators of subsequent adult outcome and evaluating the significance of these indicators.
Subjects: (1) Foster children under agency care for more than five years who were not mentally retarded, were not adopted, and did not terminate with agency before age 11; (2) foster homes in which these children stayed for longest and most recent period; and (3) current foster children, more than two years in care.
Methods: Analysis of early placement and preplacement histories in light of assessed adult outcome. Clinical investigation of children currently in foster care and foster parents assessed to be representative of certain categories derived from histories.
Findings: Original sample could be divided into "high-risk" and "low-risk" groups by means of certain simple indicators referring to situation at time of placement. Other indicators, referring to foster homes, offer means of identifying those situations most beneficial and most dangerous to children from the "high-risk" group.
Duration: 1962-1965.
Investigator(s): H. B. M. Murphy, M.D., Ph.D., Associate Professor of Psychiatry, McGill University, Montreal, Que.
Cooperating group(s): Children's Service Center; Grant Foundation.
Publication: Partial findings to appear in Mental Hygiene during 1964. Other papers will follow.

17-Y-13 FOSTER PARENT MOTIVATION AND EFFECTIVENESS

Purpose: To investigate the patterns of motivation associated with foster parenting, and to attempt to relate these to foster parent effectiveness as determined by the short-term (six months) outcome of foster child placement.
Subjects: A group of recently licensed foster parents.
Methods: Information regarding foster parent motivation will be obtained by analyzing the contents of semistructured interviews with the group of foster parents under study, searching for individual motivational themes and for recurring patterns of themes. Foster parent effectiveness will be determined six months after placement by the completion of separate mailforms by the agency worker and the school teacher. Foster parents will then be ordered

into six different groups based on an analysis of the mailforms. Attempts will be made to relate patterns of foster parent motivation and individual motivation themes to foster parent effectiveness.
Investigator(s): Joel Saldinger, M.D., Department of Psychiatry, Mount Zion Medical Center, 2255 Post, San Francisco, Calif.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

17-Y-14 WHAT HAPPENS TO FAMILIES IN THE YEAR BEFORE INITIAL FOSTER CARE PLACEMENT

Purpose: To study economic, social, and health aspects of the familial situation experienced by the newly placed foster child in the 12 months prior to placement, in order to identify areas in which social, health and other community services could have been helpful in maintaining family life, thereby reducing number of children requiring foster care.
Subjects: Approximately 400 families of children who are experiencing their first social agency foster care placement. Cases will be identified through intake records of the Bureau of Child Welfare, New York City Department of Welfare, and will represent entire population of those youngsters who meet study criteria during a two to three month intake period.
Methods: Data will be gathered through extensive retrospective research interviews with parent or parents (or other guardian) who cared for the child during 12 months prior to placement. Following identification of study population from the Department of Welfare intake records, home interviews will be made by trained social workers. Interview will focus on the following seven content areas: economic situation, housing, family situation, health, agency contacts, school experience, child care. Interview will begin with an exploration of family's situation 12 months prior to placement in these content areas, and will then trace changes in situation during the year, what family did about the change, why, and with what results. This will include exploration of family's personal resources, when and to what extent they were used, family's knowledge and use of community services, and why these services were not used sooner, or at all. Effort will be made both to identify critical incident or situation giving rise to decision for placement, as well as to describe relevant long term chronic factors. Selected data will be validated through reading of agency case records on a 10 percent sample of study population.
Duration: January 1963-July 1964.
Investigator(s): Mignon Sauber, M.A., Director, and Shirley Jenkins, Ph.D., Research Department, Community Council of Greater New York, 225 Park Ave. South, New York, N. Y. 10003.
Cooperating group(s): New York City Department of Welfare; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Study will be published by Community Council of Greater New York.

17-Y-15 PSYCHIATRIC CARE THROUGH SPECIAL FOSTER HOMES

Purpose: To develop a treatment program for emotionally disturbed children combining a brief period of residential care during study and diagnosis, and specialized foster home care as part of the treatment plan.
Subjects: School aged boys and girls selected on basis of behavioral criteria.
Methods: Training program for foster parents, including group meetings, seminars, and individual supervision held at Merrifield House of the Children's Friend Society. Children in residence at Merrifield meet foster parents and initial contacts begin. Following foster home placement, therapeutic activities and any remedial education for the child continue; foster parents training program also continues with additional individual supervision and foster home contacts. Evaluation will be concerned with validity of established criteria

for selection of foster parents, parent participation in training program, and relationships with the child. Progress of children will be evaluated on basis of social and psychological functioning at intake compared with their functioning during treatment and placement program.
Duration: 1961-March 1966.
Investigator(s): Jean B. Griesheimer, M.S.S.W., Executive Director, Isabel C. Wooten, Caseworker, Worcester Children's Friend Society, 2 State St., and Joseph Weinreb, M.D., Executive Director, Worcester Youth Guidance Center, Worcester, Mass.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

17-Y-16 PROJECT FOR THE ESTABLISHMENT OF THERAPEUTIC FOSTER HOMES FOR EMOTIONALLY DISTURBED CHILDREN

Purpose: To demonstrate that emotionally disturbed children who need to be in a family home can have their needs met in a therapeutic foster home. Foster homes will be selected to carry out a professionally prescribed treatment program for a particular child. In addition to the demonstration aspect of the project, instruments of measurement will be developed to evaluate the outcome.
Subjects: Approximately 20 emotionally disturbed children, under 16 years of age, and the same number of foster parents.
Methods: Design of research instruments as indicated.
Duration: August 1963-July 1966.
Investigator(s): I. W. Fellner, M.S.W., Catherine R. Clement, M.S.W., and Lawrence de Fato, M.S.W., San Mateo County Department of Public Health and Welfare, San Mateo, Calif.
Cooperating group(s): California State Department of Social Welfare.
Publication: Eventual publication is planned.

17-Y-17 DELINQUENT YOUTH IN FOSTER FAMILIES OR IN INSTITUTIONS

Purpose: Hypotheses: (1) foster families could be more effective in handling juvenile delinquents than institutions, and (2) effectiveness depends on the child's age at commitment to the foster family.
Subjects: 18 delinquent boys sent to foster families, and 18 delinquent boys of the same age sent to an educational institution.
Methods: Subjects given medical examination and clinical interviews; social worker visits all families of all subjects, and the foster families.
Duration: June 1961-December 1963.
Investigator(s): Dr. Bronislav Skaberne, Katja Vodopivec, Marijan Blejec, Vinko Skalar, and Milos Kobal, Institut za Kriminologijo pri Pravni fakulteti v Ljubljani, Trg revolucije st. 11, Jugoslavija. (Reported by NCCD.)
Cooperating group(s): Council for Social Welfare of the People's Republic of Slovenia; Boris Kidric Research Fund.

17-Y-18 ANALYZING THE DECLINE IN APPLICATIONS FOR ADOPTION

Purpose: To identify factors relating to decline in applications for adoption.
Methods: Mail survey of all agencies offering adoption services in the United States. Key informants are asked to report local community conditions which seem to be affecting number of adoption applicants. Description of

changes in agency requirements that may have been effected to meet the decline in applications. Major study of social and psychological variables affecting the flow of applications to adoption agencies may follow.
Duration: November 1962-not reported.
Investigator(s): Lydia F. Hylton, M.S.W., Research Associate, and David Fanshel, D.S.W., Director of Research, Child Welfare League of America, 44 E. 23rd St., New York 10, N. Y.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

17-Y-19 CONSEQUENCES OF A STATE SUITABLE HOME LAW FOR ADC FAMILIES IN FLORIDA

Purpose: To focus on consequences of Florida's Suitable Home Law for families in which mothers either withdrew application for assistance or withdrew from assistance as a direct result of the law.
Subjects: Approximately 1800 former payees of ADC grants (large majority Negro mothers) who withdrew from ADC program between June 1959 and June 1961, plus control group of approximately 850 payees who have remained on ADC rolls.
Methods: Statewide sample of subjects, stratified by seven geographic areas drawn from closed files (experimental group) and open files (control group) of Florida State Department of Public Welfare. Interviews in spring of 1964 and reinterviews approximately one year later. Data also extracted from case files of Florida State Department of Public Welfare.
Duration: November 1963-October 1965.
Investigator(s): Lewis M. Killian, Ph.D., Associate Director, Roland J. Chilton, Ph.D., Research Associate, Charles M. Grigg, Ph.D., Director, Institute for Social Research, and Meyer Nimkoff, Ph.D., Head, Sociology Department, Florida State University, Tallahassee, Fla.
Cooperating group(s): Florida State Department of Public Welfare; Social Security Administration, U. S. Department of Health, Education, and Welfare.

RESEARCH NOTES

NEW EDUCATION REFERENCES ANNOUNCED BY PHI DELTA KAPPA

Phi Delta Kappa will soon begin the biennial publication of a National Register of Educational Research Personnel. The first issue is currently being prepared at the Ohio State University and is expected to be completed by fall 1964. Later plans include a compilation of research projects in education to be entitled Education Abstracts and scheduled for fall 1966.

DATA PROCESSING SYSTEMS COMPLETED IN CLEARINGHOUSE

The Children's Bureau Clearinghouse for Research in Child Life recently completed its conversion of mailing lists to computer operation. A new system of preparing copy for publication has also been installed. This is the first issue of Research Relating to Children produced under the new process. It is hoped that the new equipment and techniques will permit the Clearinghouse to extend its coverage of research in "under-represented" fields, and to increase its services to research personnel through wider distribution of publications and closer communication with contributors.

COMING - REGIONAL RESEARCH CENTERS IN CHILD HEALTH AND HUMAN DEVELOPMENT

An Information Centers Program has recently been established at the National Institute of Child Health and Human Development of the U. S. Public Health Service. Dr. Charles Bernier, Head of the new program, emphasized the focus on health rather than on disease forms usually studied in the other Institutes. When fully operational, the new program will consist of a series of regional research and information centers, each focusing on a specific aspect of health and development. The first center is to be located in Baltimore and will be concerned with the aging process (age 21 and above).

OFFICE OF EDUCATION TO ADMINISTER NEW PROGRAM FOR HANDICAPPED

The U. S. Office of Education has established a new Division to administer the teaching and research program established under Title III of Public Law 88-164. The Law provides for a program of grants-in-aid for the training of personnel needed to educate handicapped children (defined as "mentally retarded, hard of hearing, deaf, speech impaired, visually handicapped, seriously emotionally disturbed, crippled, or other health impaired children who by reason thereof require special education") and for a program of research and demonstration projects in this area. The sum of $53 million is authorized over a three-year period for this purpose. Dr. Samuel A. Kirk, former Professor of Psychology and Special Education at the University of Illinois and Director of the Institute for Research on Exceptional Children, has been appointed to head the new Division.

NEW PERINATAL RESEARCH CENTER IN CLEVELAND

A clinical research center to study problems of pregnancy, birth, and infancy will be established as the result of a U. S. Public Health Service grant to the School of Medicine, Western Reserve University, Cleveland, Ohio. In the unique 12-bed center, obstetricians and pediatricians will take a new approach to the investigation of perinatal problems. Each patient will be closely followed during both the prenatal and the postnatal periods. Initial research will focus upon problems relating to fetal anoxia, metabolic and endocrinologic conditions during pregnancy, and other conditions possibly related to infant mortality and disease. The Center is to be located in the Cleveland Metropolitan General Hospital, and will be co-directed by Dr. Robert S. Schwartz, Associate Professor of Pediatrics and Dr. Edward J. Quilligan, Professor of Obstetrics and Gynecology.

OTHER ABSTRACTING JOURNALS AND SERVICES

Child Development Abstracts and Bibliography, Child Development Publications, Society for Research in Child Development, Inc., Purdue University, Lafayette, Ind.
Digest of Neurology and Psychiatry, Institute of Living, Hartford, Conn.
Dissertation Abstracts, University Microfilms, Ann Arbor, Mich. (Gives synopses of U. S. doctoral dissertations with an annual index.)
dsh abstracts, Deafness, Speech and Hearing Publications, Gallaudet College, Washington 2, D. C.
Excerpta Criminologica, New York Academy of Medicine Bldg., 2 E. 103rd St., New York 29, N. Y.
Inventory of Social and Economic Research in Health, Health Information Foundation, 420 Lexington Ave., New York 17, N. Y.
Listing of Health and Welfare Research Projects in Local Communities, United Community Funds and Councils of America, Inc., 345 E. 46th St., New York 17, N. Y.
Nursing Research, American Journal of Nursing Co., 10 Columbus Circle, New York, N. Y.
Nutrition Abstracts and Reviews, Rowett Research Institute, Bucksburn, Aberdeenshire, Scotland.
Psychological Abstracts, American Psychological Association, 1333 - 16th St., N. W., Washington 6, D. C.
Rehabilitation Literature, National Society for Crippled Children and Adults, 2023 W. Ogden Ave., Chicago 12, Ill.
Research and Study Projects Reported by FSAA Member Agencies, Family Service Association of America, 215 Park Ave. South, New York 3, N. Y.
Sociological Abstracts, Leo P. Chall, 225 W. 86th St., New York 24, N. Y.
Sources of Morbidity Data, Clearinghouse on Current Morbidity Statistics Projects, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington 25, D. C.

The Excerpta Medica Foundation, New York Academy of Medicine Bldg., 2 E. 103rd St., New York 29, N. Y., has established an abstracting service on pediatrics on a yearly subscription basis. In addition to abstracts, Excerpta Medica can provide to subscribers, at cost, photocopies and translations of complete articles.

Human Relations Area Files have classified cultural data on primitive and non-primitive societies into 888 categories of human behavior. Complete sets of all files are available in 16 member universities in the United States. For information, write to Dr. Clellan S. Ford, President, Human Relations Area Files, Yale University, New Haven, Conn.

Science Information Exchange, Smithsonian Institution, 313 Universal Bldg., Connecticut and Florida Aves., N. W., Washington 6, D. C., provides to qualified investigators on request selected abstracts of current research supported by foundation or government grants. The Exchange covers such fields as medicine, nursing, public health, nutrition, psychology, education, anthropology, mental health, and intercultural relations.

World Federation for Mental Health, 19 Manchester St., London W.1, England, operates a clearinghouse for research and study projects in the field of mental health.

In addition to these journals and services, many professional journals in such fields as pediatrics and mental deficiency include a section of abstracts regularly or once a year. There are also a number of indexes and abstracting journals in the medical area which occasionally refer to materials in the area of child development.

ACCORDING TO THE CRITERIA ESTABLISHED BY THE CLEARINGHOUSE, THE FOLLOWING TYPES OF STUDIES ARE NOT ELIGIBLE FOR INCLUSION IN RESEARCH RELATING TO CHILDREN

Studies already reported to the Clearinghouse

Studies already published or which will be published before the next issue of Research Relating to Children

Studies completed more than two years ago

Masters' theses, unless they represent work beyond a doctorate, as in dentistry

Annual or biennial reports or other regularly collected information

Handbooks, manuals, directories, textbooks, etc.

Historical or descriptive studies; studies based on secondary sources; bibliographical materials

Studies of test development, standardization, or validation, except tests for special groups of children such as blind or retarded

Studies of local or temporary significance; those of interest primarily to the agency involved

Studies of services or programs not primarily related to children

Studies of general population in which children comprise only an incidental part

Demonstration projects where no formal plan for evaluation is described

Studies of college students or adults where the focus is not on their childhood; studies of parents where the emphasis is not on their children

Educational studies of curriculum construction or materials; teaching methods; general school personnel studies where children are not directly affected; survey of school facilities or needs; general school administration studies

Studies of the training, personality, or aptitude of personnel without measurement of the effects on children

Medical, dental, or nutrition studies limited to: morphology or physiology; the physical aspects of etiology, epidemiology or symptomatology of diseases or handicapping conditions; surgery, chemotherapy, antibiotics or physical therapy, etc. (According to 1956 revision of criteria for inclusion.)

Biochemical or other laboratory studies

NOTICE OF RESEARCH PROJECT

for inclusion in
Research Relating to Children,
the Children's Bureau
inventory of current
research projects

For purposes of this inventory, "children" are defined as persons under 18 years of age, or college students if their childhood is of primary concern.

PLEASE REPORT STUDIES IN PROGRESS ON CHILDREN	growth and development • intelligence • personality and emotional disorders • educational process • health and social services for children
PLEASE DO NOT REPORT STUDIES	already reported, published, or soon to be published • completed more than two years ago • on purely medical subjects • on curriculum development or teaching methods • on personnel training • on test development (except for special groups of children such as blind or mentally retarded) • of local or temporary significance • demonstration projects unless there is a formal plan for evaluation • masters' theses, unless they represent work beyond a doctorate, as in dentistry

---

If you or your colleagues are currently doing research on children, please supply the information requested on the reverse side.

If you are not doing research on children now, do you expect to do any in the next two years?
yes _____ no _____ do not know _____

Does this information represent a reply for -- an individual only _____
an organization or department as a whole _____

If you know of other investigators of whose research the Clearinghouse should be informed, please give name(s) and address(es) below:

FOREWORD

This Bulletin like previous issues, includes reports of research in progress or research very recently completed. It does not report again studies included in Bulletin 3 through 17 even though they are still continuing. This issue, therefore, does not reflect all research relating to children in a given period but only that which was first reported to the Clearinghouse March 1, 1964 through December 31, 1964.

The Clearinghouse has only such information about the research projects as the abstracts provide. Publication references and plans are given for some of the projects, but the Clearinghouse cannot attempt to keep track of the final publication of the studies. The reader who wishes to obtain further information about any of the projects reported should write directly to the investigator or check professional journals in the appropriate field.

For the Clearinghouse, I wish to thank those who have submitted reports and to acknowledge the valuable assistance of the National Council on Crime and Delinquency, the Clearinghouse on Current Morbidity Statistics Projects of the U. S. Public Health Service, and the several foundations which provide us with information about recent research grants.

Note: The reports in this section concern research programs which are more or less continuous.

18-A-1 GROWTH, DEVELOPMENT, AND ADAPTATION OF HUMAN INDIVIDUALS

Purpose: To gain greater understanding of many factors involved, prenatal and postnatal, as an individual is in the process of becoming the kind of a person he is as an adult.
Subjects: Approximately 100 middle class families in Denver, Colorado, including 210 offspring of whom over 50 are second generation followed in the institute. (80 percent of subjects entered since 1930 are still being followed.)
Methods: Each subject followed from birth at regular intervals studying: (1) pattern of changing structure by direct measurements, X-rays, and photographs; (2) development of personality traits, starting with family during prenatal period and carried on intensively with infant, child, and adult; (3) patterns of physiological development including nutrition, biochemical and physiological tests, and evaluation of healthiness.
Duration: 1927-continuing.
Investigator(s): Robert W. McCammon, M.D., Director, Child Research Council, University of Colorado, 4200 E. Ninth Ave., Denver 20, Colo.
Cooperating group(s): University of Colorado; Commonwealth Fund; McDonald Foundation; Nutrition Foundation; National Live Stock and Meat Board; Gerber Company; Lawrence Phipps Foundation; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Appropriate medical or scientific journals every year. Publication lists available.

18-A-2 ANALYSIS AND EVALUATION OF DATA FROM THE LONGITUDINAL STUDY OF CHILD HEALTH AND DEVELOPMENT BASED UPON MULTIDISCIPLINE AND PERIODIC OBSERVATIONS OF INDIVIDUAL CHILDREN FROM BIRTH TO 18 YEARS

Initiation date: 1930.
Investigator(s): Research has been discontinued but the analyses of data and preparation of reports are being continued by individuals under the direction of Robert B. Reed, Ph.D., Professor of Biostatistics, Harvard School of Public Health, 55 Shattuck St., Boston 15, Mass.

18-A-3 LONGITUDINAL STUDY OF CHILD GROWTH AND DEVELOPMENT

Purpose: Program consists of study of adult personality, adjustment and aging processes of individuals whose health, growth, personality development, and environment have been studied since birth. It included a study of the aging processes of their parents in relation to physical and biochemical measures made earlier. It will include studies of: parental child-rearing attitudes and practices of two generations in the same families; constancy of autonomic response patterns to stress from childhood to young adulthood and their relationship to psychosomatic disorders in adulthood; blood lipids in relationship to body composition and change in composition.
Investigator(s): Lester W. Sontag, M.D., Director, Fels Research Institute for the Study of Human Development, Antioch College, Yellow Springs, Ohio.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

18-A-4 LONGITUDINAL CROSS-CULTURAL STUDY OF HUMAN DEVELOPMENT

Purpose: To observe the long term effects of environment upon growth and health, that is, the influence of environmental factors upon physical and mental development, and the elucidation of their mode of action and interaction with genetic endowment.
Subjects: Several hundred males followed from prepuberty, all with four grandparents from the same limited geographical zone of southern Italy but now living in the markedly different cultures of Boston, Rome, and Palermo; other groups of 100 girls and several hundred boys in Florence, Italy and 200 girls in Boston.
Methods: Repeated medical, anthropometric and psychological examinations together with family interviews (with evaluation of child-rearing practices), nutrition, and socio-cultural data.
Findings: Reported in numerous articles in American and European journals. Current work under analysis includes cross-cultural study of moral values, studies of biological age and its estimation, estimation of socio-economic status across cultures, blood groups and temperament, and changing hemoglobin values in adolescent males. Work involving further and continuing data collection includes prediction of growth variables, cross-cultural study of creativity and its environmental determinants, a study of left handed subjects in the relatively "permissive" and "intolerant" cultures of the United States and Italy, and an analysis of menstrual symptoms in both cultures.
Duration: 1956-1968.
Investigator(s): Harben Boutourline Young, M.D., Assistant Professor of Physiology, Harvard School of Public Health, Boston 15, Mass.
Cooperating group(s): Grant Foundation; Wenner Gren Foundation; Olivetti Corporation; Universities of Florence, Rome, and Palermo.
Publication: Numerous journal articles; one book is planned, another possible.

18-A-5 THE BERKELEY (CALIFORNIA) GROWTH STUDY

Purpose: A study of the mental and physical growth of approximately 50 normally healthy persons from birth in 1928-29 to the present (35 years).
Subjects: Full term, healthy newborns, born in Berkeley, California hospitals of white, English-speaking parents, if parents were interested--a somewhat selected above average group. 100 offspring of these subjects, age range from a few months to about 16 years, seen irregularly, but the same data (appropriate for age) are collected that were collected for their parents.
Methods: Tests of mental and motor development; pediatric examination; interviews at frequent intervals during growth beginning in first week of life. At all visits, inquiries made concerning current health and recent illnesses. Anthropometrics, body photographs and skeletal X-rays taken at most ages. Socio-economic data available. Comparisons now being made on variety of collected data. Studies of physical aspects of children's growth include analyses comparing health histories with physical growth and with skeletal maturation. Some parent-child relations in susceptibility to illness could be studied. Emotional and other personality variables studied for consistency, and in various interrelations with maternal behavior in infancy, birth histories, socio-economic status, intellectual and physical growth.
Duration: 1928-continuing.
Investigator(s): Nancy Bayley, Ph.D., and Dorothy H. Eichorn, Ph.D., Associate Research Psychologist, Institute of Human Development, University of California, Berkeley 4, Calif.
Cooperating group(s): Institute of Human Development, University of California.
Publication: Studies in the Development of Young Children, University of California Press, 1940. Growth Diagnosis, University of Chicago Press, 1959. Child Development 12:167-173, 1941; 27:45-74, 1956. American Psychologist 10: 805-818, 1955. Monograph, Society for Research in Child Development 28, 1963.

18-A-6 THE MEDFORD, OREGON BOYS' GROWTH STUDY, 7 TO 18 YEARS

Purpose: To construct structural, strength, and motor cross-sectional, convergence, and longitudinal growth curves for boys 7 to 18 years of age; to study individual differences at all ages; to relate the various structural, strength, and motor tests to maturity, physique type, social-personal adjustment, interests, and scholastic aptitude and achievement; to contrast all traits for boys at different levels of athletic ability.
Subjects: Cross-sectional sample: 40 boys at each age, 9 through 15 years. Longitudinal sample: over 100 boys at each age, 7, 9, 12, and 15 years.
Methods: (1) Construction of mean growth curves; study of individual differences by use of range, standard deviation, and coefficient of variation; (2) contrast of maturity groups and somatotype categories; (3) factor analyses at single ages; (4) contrast of athletes and nonparticipants, longitudinally and cross-sectionally; and (5) determination of relationships through correlation, multiple correlation, and partial correlation; utilization of multiple regression equations.
Duration: October 1956-May 1968.
Investigator(s): H. Harrison Clarke, Ed.D., Research Professor of Physical Education, University of Oregon, Eugene, Oreg.
Cooperating group(s): Medford, Oregon Public Schools; Southern Oregon College; Athletic Institute; Curriculum Development Fund of the Oregon State Department of Education; Office of Scientific and Scholarly Research and School of Education In-Service Program, University of Oregon.
Publication: To date, 34 completed master's theses and doctoral dissertations are available in Microcard form; a number of articles and review statements have been published.

18-A-7 PATTERNS OF SOOTHING AND EXCITATION IN NEONATES

Purpose: To investigate the role of excitatory and inhibitory patterns in neonatal development through use of behavioral ratings and heart rate measurements. This research is part of a long-term study of regulatory principles and mechanisms which govern neonatal behavior (see Bulletin 5, Research Relating to Children).
Subjects: Normal, healthy, 2 to 5 day old full term babies born at Bronx Municipal Hospital Center.
Methods: Heart rate and behavioral ratings obtained for all experimental sessions. Each neonate tested at three sessions: test, retest on reactions to a series of soothing stimuli, and one session of trials of excitatory stimuli. Soothing stimuli applied when neonates are aroused are a tone, rocking, sweetened pacifier inserted in babies' mouths, immersion of babies' feet in warm water, and a control period. Each stimulus condition applied three times. Excitatory stimuli applied after feeding when neonates are quiescent are a tone, cold disc applied to the abdomen, and rocking.
Findings: Data analyzed with respect to (1) relationship between heart rate and behavioral ratings; (2) individual differences in overall soothability and in most effective soothing stimuli; (3) test-retest reliability on successive days; and (4) relationship between excitatory and inhibitory patterns.
Duration: January 1962-continuing.
Investigator(s): Sibylle Escalona, Ph.D., Professor of Psychology in Psychiatry, Wagner H. Bridger, M.D., Assistant Professor of Psychiatry, Beverly M. Birns, Ph.D., and Marion Blank, Ph.D., Instructors in Psychology, Department of Psychiatry, Albert Einstein College of Medicine, Yeshiva University, New York 61, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-A-8 INSTITUTE FOR CHILD STUDY OF PHILADELPHIA

Purpose: To develop standards and norms of physical growth, specific for children of urban Philadelphia. Longitudinal study based on annual or semiannual follow-up of more than 2,000 children registered at the Institute.
Methods: School Series: initially based on 600 school children in 5 schools (now 22 schools), ages 6-12, "normal" medically and dentally; data collected on national and ethnic background, socio-economic status of parents, medical and dental health history of child, height and weight of parents and siblings, anthropometric measurements and X-rays. American Negro Series: 150 Negro children with normal occlusion selected to study with a view to establishing tentative standards of facial growth. Pilot Study Series: extensive study of 75 children, 6 to 8 years of age, seen every three months for measurements, X-rays, dietetic histories, careful medical examination data, blood chemistry, oral pathology data, etc. Orthodontic Series: all children accepted by Orthodontic Clinic had lateral and postero-anterior head films taken and detailed measurements of head and face made. Orthodontic Treatment Series: a small pilot study of 15 white boys, age 11 to 15, with a certain type of malocclusion accompanied by V-shaped, high-vaulted palate; 15 with identical orthodontic condition; 15 with normal occlusion--first group to receive free orthodontic care, second and third groups to receive free dental care but no orthodontic treatment. Cleft Palate Series: growth pattern of 250 children with cleft lip and/or palate. Cooley's Anemia Series: family-line investigation of 25 children for traits other than the disease such as facio-dental growth dysplasia. Endocrine Series: evaluation of degree of growth deviation with follow-up to study effect of endocrine therapy upon growth pattern. Behavioral Series: 110 first, second, and third graders rated in terms of physical growth progress and simultaneously in terms of grades, emotional

stability, and other aspects of classroom behavior to see if there is any real correlation.
Duration: 1947-1967.
Investigator(s): Wilton M. Krogman, Ph.D., Director, Philadelphia Center for Research in Child Growth and F. E. Johnston, Ph.D., Assistant Professor of Anthropology, University of Pennsylvania, Philadelphia, Pa.
Cooperating group(s): Institute for Child Study of Philadelphia (sponsored by Graduate School of Medicine and Evans Institute of Dentistry of University of Pennsylvania and Children's Hospital of Philadelphia); Philadelphia Department of Public Health; Philadelphia Board of Public Education; Public Health Service, U. S. Department of Health, Education, and Welfare.

18-A-9 GROWTH RESEARCH UNIT

Purpose: To gain insight into critical factors influencing growth patterns of all children by observing the growth and development of deviates, especially those with pathological diagnoses which have been medically documented.
Subjects: Children with congenital cardiac lesions, and children and adolescents with significant deviations of physical, neurological, and behavioral development.
Methods: Inspection, anthropometry, photography, X-ray of the left hand and wrist. Analysis of these basic data for current status and for growth trends.
Duration: 1929-1969.
Investigator(s): Leona M. Bayer, M.D., Co-chairman, Youth Clinic, Presbyterian Medical Center, San Francisco, and Adjunct Clinical Associate Professor of Medicine, Stanford University, Palo Alto, Calif.
Cooperating group(s): Institute of Medical Sciences; Service for Developmentally Handicapped Children.
Publication: Journal of Clinical Endocrinology and Metabolism, 22:1127-1129, November 1962; Journal of Pediatrics, 62:5:631-645, May 1963.

18-A-10 LONGITUDINAL STUDY OF DENTOFACIAL, SKELETAL, PHYSICAL GROWTH AND NUTRITION OF CHILDREN

Purpose: To study the dentofacial growth of children, standards of nutrition, caries increment as related to nutrition, assessment and skeletal age as related to facial growth, variations in physique and its effect on dentofacial growth. Twins are also being studied to determine heritable traits.
Subjects: 400 children, including 40 pairs of twins, ages 3 to 18 years, who have been observed for periods of 3 to 10 years.
Methods: Cephalograms, hand, wrist, and calf X-rays, intra-oral X-rays, study casts, anthropometric measurements, photographs, oral examination, and one-week food diary. Children are examined every six months until 14 years of age.
Initiation date: 1950.
Investigator(s): Bhim S. Savara, D.M.D., M.S., Professor and Head, Child Study Clinic, University of Oregon Dental School, 611 S.W. Campus Dr., Portland 1, Oreg.
Cooperating group(s): University of Oregon Dental School; Oregon State Board of Dental Examiners; Tektronix Foundation, Inc.; Medical Research Foundation of Oregon; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Recent articles: Radiology, April 1961; July 1962; Journal of Dental Research, July-August 1961; July-August 1962. Human Biology, February and September 1962.

18-A-11 RADIOGRAPHIC ATLASES OF SKELETAL DEVELOPMENT

Purpose: To develop radiographic standards of skeletal development for use as reference standards for children.
Subjects: 4483 Cleveland children; 134 Boston children; and a sample of Detroit children.
Methods: Series of films of hand, elbow, shoulder, hip, knee, and foot of healthy children are used to identify the modal (moderate) rate of bone development. Revisions or initial standards are prepared as needed to provide standards of reference.
Duration: 1948-1966.
Investigator(s): S. Idell Pyle, Ph.D., Research Associate, Department of Anatomy, Western Reserve University, Cleveland, Ohio; and William Walter Greulich, Ph.D., Professor and Head, Department of Anatomy, Stanford University, Stanford, Calif.
Cooperating group(s): Bolton Study (Cleveland); Department of Maternal and Child Health, Harvard University School of Public Health.
Publication: Current standards: Radiographic Atlas of Skeletal Development of Elbow and Shoulder; Radiographic Atlas of Skeletal Development of Hip. The latest standard for the hand was published in 1959; foot in 1962; and knee in 1955.

18-A-12 COLLABORATIVE STUDIES IN CEREBRAL PALSY AND OTHER NEUROLOGICAL AND SENSORY DISORDERS OF INFANCY AND CHILDHOOD

Purpose: To investigate factors and conditions affecting parents: (1) conditions of pregnancy itself, such as infections, trauma, bleeding, drugs, and progress of labor; (2) environmental factors influencing mother, such as social and economic conditions, emotional stress, and medical care; (3) biological factors in parents such as age, parity, medical and reproductive history, and immunologic characteristics; (4) genetic background of parents. To investigate in the offspring: disorders of the nervous system of all products of conception at time of delivery or appearing during infancy or early childhood, including cerebral palsy, mental subnormality, behavioral disorders, etc. A detailed investigation of the independent variables will be directed toward the re-evaluation of the effect of factors already suspected, the elucidation of the mechanism through which these factors are operative, and the discovery of factors neither presently known nor suspected.
Subjects: Approximately 8,000 live births per year from 15 collaborating institutions for five years. Offspring followed until school age.
Methods: Analysis of pooled information collected in a uniform way in a number of medical centers throughout the country from women studied during pregnancy and from their offspring followed throughout infancy and early childhood. Intensive study of limited number of cases; less intensive study of as many damaged children and abnormal pregnancies as possible.
Initiation date: 1956.
Investigator(s): Richard L. Masland, M.D., Coordinator of Project, National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington, D. C. Collaborating institutions: Children's Hospital, San Francisco, Calif.; Yale University School of Medicine, New Haven, Conn.; Charity Hospital, New Orleans, La.; Johns Hopkins University School of Medicine, Baltimore, Md.; Boston Lying-In Hospital and Children's Medical Center, Boston, Mass.; University of Minnesota Medical School, Minneapolis, Minn.; Columbia-Presbyterian Medical Center and New York Medical College, New York, N. Y.; University of Buffalo, Buffalo, N. Y.; University of Oregon Medical School, Portland, Oreg.; Children's Hospital of Philadelphia and Pennsylvania Hospital, Philadelphia, Pa.; Brown University, Providence, R. I.; University of Tennessee Medical School, Memphis, Tenn.; Medical College of Virginia, Richmond, Va.
Publication: Johns Hopkins Magazine, June 1959.

18-A-13 RESEARCH ON SPEECH AND LANGUAGE DISORDERS

Purpose: To investigate etiology, prevention, and rehabilitation in speech and language disorders of children with cerebral palsy, aphasia, cleft palate, endocrine disorders, Mongolism, or mental deficiency.
Subjects: Study group chosen from clinical population, approximately 1,500 cases, and matched with normal controls.
Methods: Basic studies on anatomy and functional laryngx, respiration, etc., including X-ray measurements and similar techniques; various other research methods (generally behavioral items) depending upon area under study.
Initiation date: 1934.
Investigator(s): Martin F. Palmer, Sc.D., Director, Institute of Logopedics, 2400 Jardine Dr., Wichita 19, Kans.
Cooperating group(s): Federally supported.
Publication: Articles appearing regularly in Journal of Speech and Hearing Disorders, Journal of Speech and Hearing Research, Cerebral Palsy Review, etc.

18-A-14 METHODS IN CHARACTER DEVELOPMENT

Purpose: To develop more effective methods in character development in cooperation with character training agencies.
Subjects: Children and families in about 30 participating church schools and other groups widely spread in the United States.
Methods: Experimental use of curriculum by participants. Reports of experimental efforts analyzed and curriculum revised on basis of findings. Methods of character education then developed and reported. Emphasis is on character growth in children.
Findings: Anticipate development of instructions for writing character building curricula. These will include types of homes, children, and classes for character development and descriptions of age-level potentials for children.
Initiation date: 1936.
Investigator(s): Ernest M. Ligon, Ph.D., Director, Character Research Project, Union College and University, Schenectady, N. Y.
Cooperating group(s): Lilly Endowment, Inc.
Publication: Published in Union College Studies in Character Research. Also Dimensions of Character, Macmillan, 1956.

GROWTH AND DEVELOPMENT

General

18-B-1 THE DEVELOPMENT OF ATTACHMENT BEHAVIOR IN THE FIRST YEAR OF LIFE

Purpose: To observe the course of development of attachment behavior, emphasizing those responses which seem most likely to be important components of attachment behavior (e.g., crying, smiling, following with the eyes, vocalization, postural adjustment and holding on, etc.), and the differential frequency and intensity of these responses as displayed to different figures; to observe influence of mother's behavior and methods of infant care upon this development, and upon nature and strength of attachment of the infant to her; to observe effect of the nature and strength of child's attachment to his mother upon his behavior toward other persons and objects.
Subjects: 36 infants in white, middle class families, obtained through pediatricians in private practice. Half the infants are to have full-time mothers, and half part-time mothers.
Methods: Four-hour visits once every three weeks from birth to 12 months of age. Chief emphasis is upon direct observation of behavior as it occurs spontaneously during the visit, paying particular attention to behavior occurring in certain situations identified as "critical" which are most likely to elicit attachment behavior. Direct observation is supplemented by interview of mother and other caretakers, by administration of the Griffiths Scale of Infant Intelligence, and by ratings of mother, caretakers, and infants.
Duration: October 1962-September 1967.
Investigator(s): Mary D. Ainsworth, Ph.D., Professor of Psychology, Johns Hopkins University, Baltimore, Md.
Cooperating group(s): Foundations' Fund for Research in Psychiatry.

18-B-2 A TRANSITIONAL CARE NURSERY FOR THE NEWLY BORN

Purpose: To obtain information concerning the clinical behavior of the neonate by following the infant in an intensive care unit similar to those units utilized for the care of postoperative patients.
Subjects: Neonates: term, premature, Cesarian section, and other "high risk" infants.
Methods: Infants are chosen by selection of mother during labor. Each infant is followed from birth to 24 hours of age by a physician-nurse team utilizing observational and physiologic monitoring techniques.
Findings: The healthy neonate appears to undergo an orderly sequence of changes in vital signs and activity during first 24 hours. This seems to be associated with two oscillations in autonomic activity--an outburst of sympathetic activity occurring at delivery, followed by a second reaction at two to six hours.
Duration: January 1963-December 1964.
Investigator(s): Murdina M. Desmond, M.D., Professor of Pediatrics, and Arnold J. Rudolph, M.D., Assistant Professor of Pediatrics, College of Medicine, Baylor University, Houston, Tex.
Cooperating group(s): John A. Hartford Foundation, Inc.
Publication: Journal of Pediatrics, 62:3:307, 1963; Obstetrics and Gynecology, 23:1:28-36, January 1964; Abstract, Society for Pediatric Research, 1962 (to be published); Postgraduate Medicine, in press.

BEST COPY AVAILABLE

18-B-3 A STUDY OF THE MATURATION OF THE SLEEPING AND WAKING STATES IN PREMATURE INFANTS

Purpose: To study maturation of sleeping and waking states of premature infants from six months gestation till normal term of nine months. It is assumed that significant changes in patterns of sleep and arousal will be detectable as premature infant matures.
Subjects: 100 infants, both premature and full-term controls.
Methods: Infants will be followed clinically for first two years of life in order to detect any infant who might deviate significantly from normal in his development; significance or insignificance of variations in early sleep patterns for predictions of later development can thus be determined. Levels of sleep and wakefulness will be judged by observation correlated with EEG's, actograms, respirations, electromyograms, eye movements, and body temperature recorded continuously during three-hour intervals. Speed of transitions from one state to another and degree of sleep and arousal achieved at six, seven, eight, and nine months of gestation will be focal point. Although primary study is of spontaneous sleep and arousal, changes in state induced by sound stimulation using Wedenberg modification of audiometer will also be recorded.
Investigator(s): Arthur H. Parmelee, Jr., M.D., Associate Professor of Pediatrics, Medical Center, University of California, Los Angeles 24, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-B-4 THE MODAL ADOLESCENT

Purpose: To determine what exactly is normal, healthy, or adaptive during the adolescent period and what is not.
Subjects: 114 modal adolescents selected in fall 1962, from total freshman male population in two local high schools.
Methods: Individual depth interviews for every subject every three to four months for three years; genetic background data; teacher rating and school performance; psychological testing (projectives); and parent interviews and ratings.
Findings: Modal adolescents exhibit: (1) almost complete absence of gross psychopathology, physical defects, and physical illness; (2) ability to experience effects flexibly and to actively bring their conflicts to successful resolutions; (3) evidence of specific struggles with aggression and sexual impulses; and (4) relatively good object relationships with adults.
Duration: Fall 1962-1965.
Investigator(s): Daniel Offer, M.D., Assistant Director and Career Investigator, Institute for Psychosomatic and Psychiatric Research and Training, Michael Reese Hospital, Chicago 16, Ill.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Archives of General Psychiatry, Vol. 9, November 1963; another article in press.

Physical

18-C-1 GROWTH OF THE BUCCO-FACIAL MUSCULATURE

Purpose: To investigate the change with age of the bucco-facial musculature in children; to investigate the difference in extensibility of the bucco-facial musculature in monozygotic and dizygotic twins.
Subjects: Monozygotic and dizygotic twins, 5 to 15 years of age.
Methods: Standard anthropometric measurements of the body and limbs and cranio-facial complex; full-face and profile color photographs; antero-poste-

rior and lateral cephalometric X-rays; X-rays of hand and wrist; dental impressions of upper and lower jaws; extensibility of buccal musculature; and serological studies.
Duration: January 1963-December 1965.
Investigator(s): Edward I. Fry, Ph.D., Associate Professor of Anthropology, University of Nebraska, Lincoln, Nebr. (Reported by Louise M. Robbins, Instructor in Anthropology, University of Nebraska.)
Cooperating group(s): College of Dentistry, University of Nebraska.
Publication: To be published upon completion of study.

18-C-2 HEAD GROWTH IN PREMATURE INFANTS

Subjects: Premature infants.
Methods: Infants are fed as much formula as they desire; findings for infants fed regular and infants fed concentrated formulas are contrasted.
Findings: Head growth may be more normal when concentrated formulas are used.
Duration: 1957-1965.
Investigator(s): Hans G. Keitel, M.D., Head, Department of Pediatrics, Jefferson Medical College of Philadelphia, Philadelphia 7, Pa.

18-C-3 INFANT NUTRITION

Purpose: To determine changes in the immune response of infants by alterations in nutrition.
Subjects: 300 experimental and 300 control infants taken from Infant Welfare Stations, Chicago Board of Health.
Methods: Growth and development studied; nutritional status determined by blood chemical analysis; antibody response to immunization and morbidity.
Duration: January 1964-January 1965.
Investigator(s): Morten B. Andelman, M.D., Consultant to Chicago Commissioner of Health, 4751 W. Touhy Ave., Lincolnwood 46, Ill.
Publication: To be published upon completion.

18-C-4 SOYBEAN ALLERGY IN CHILDREN

Purpose: To observe the frequency and mode of sensitization to this allergenic food.
Methods: Clinical studies; immunologic techniques.
Findings: It seems that by purposeful feeding of soy milks, as well as by adulteration of many ordinary foods with soy flours and flavorings, and by the inadvertent contamination of the atmosphere in the manufacture of many plastics and other products, a vast number of the allergic population is being sensitized to a large botanical group of foods.
Investigator(s): Joseph H. Fries, M.D., Director of Allergy, Methodist Hospital, Brooklyn, N. Y.
Cooperating group(s): Martin Foundation.
Publication: Papers have been presented to the American Academy of Allergy and the Academy of Pediatrics.

18-C-5 NUTRITIVE VALUE OF VEGETABLE PROTEINS IN INFANTS

Purpose: To conduct a follow-up of short-term nitrogen balance studies (rice, wheat, soya, cottonseed, peanut meal, combinations, and supplements) by long-term administration of some of more promising vegetable proteins and evaluation

of their effect on growth and development; to look for possible subtle deficiencies or defects which may arise.
Methods: Vegetable products will be given as sole source of protein for three months and results will be compared with those obtained during a similar period on milk. Various physical parameters such as weight, length, head circumference, liver size, skinfold thickness, and upper arm circumference will be measured at intervals as well as a number of biochemical determinations. Every six weeks nitrogen and electrolyte balances will be carried out in order to relate growth to these balances.
Duration: Not reported-1967.
Investigator(s): Russell J. Blattner, M.D., Professor, and L. Leighton Hill, M.D., Assistant Professor, Department of Pediatrics, College of Medicine, Baylor University, Houston, Tex. 77025.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-C-6 NUTRITIONAL STATUS SURVEY (BIOCHEMICAL FINDINGS) ON ADOLESCENT MALES AND FEMALES

Purpose: To determine the average blood levels in healthy adolescents for certain nutrients such as ascorbic acid, carotene, and vitamin A. In addition, hematocrit values and urinary excretion levels for thiamine and riboflavin are also being done. Transketolase determinations on red cell hemolysates are included.
Subjects: Junior high school students in city of Syracuse and Onondaga County.
Methods: ICNND methods for biochemical determinations are used except for transketolase. (Journal of Nutrition, 71:273-282, 1960.)
Duration: July 1962-1967.
Investigator(s): Myron Brin, Ph.D., Associate Professor of Biochemistry and Medicine, Upstate Medical Center, State University of New York, Syracuse, and Marjorie Dibble, M.S., Assistant Professor of Foods and Nutrition, Syracuse University, Syracuse, N. Y.
Cooperating group(s): National Vitamin Foundation.

18-C-7 OBESITY IN ADOLESCENCE

Purpose: To study characteristics of malnutrition in adolescents with particular reference to obesity: typing of obesity, etiological factors in development of obesity, and psychological effects of obesity.
Subjects: Adolescent girls.
Investigator(s): Jean Mayer, Ph.D., D.Sc., Associate Professor of Nutrition, Harvard School of Public Health, Boston, Mass.
Publication: Representative publications of work already done may be found in the following: American Journal of Clinical Nutrition, 12:1 and 13:35, 1963; 14:211, 1964; Journal of the American Medical Association, in press.

18-C-8 LEFT-RIGHT DISCRIMINATION IN NORMAL AND RETARDED CHILDREN

Purpose: To develop a left-right discrimination test and relate performance on this test to handedness, laterality-directionality, reading ability, intelligence, and performance on academic achievement tests.
Subjects: Average public school children and selected retarded children.
Duration: March 1964-June 1966.
Investigator(s): Daniel R. Boone, Ph.D., Associate Professor of Hearing and Speech, Medical Center, University of Kansas, Kansas City, Kans. (Reported by June Miller, Ed.D., Associate Professor and Educational Director, Hearing and

Speech Department, Medical Center, University of Kansas.)
Publication: Journal publications as indicated.

18-C-9 DEVELOPMENT OF MOTOR PERFORMANCE OF CHILDREN

Purpose: To examine individual patterns of motor performance and development in a longitudinal analysis. The two basic concerns will be consistency of performance, as measured by relative performance on different tests, and stability of performance, as measured by relative achievement on the same test in year to year comparisons.
Subjects: Approximately 50 boys and 50 girls, age 6 at time of initial testing; approximately 50 boys and 50 girls, age 8.
Methods: Eight motor performance tests (30 yard dash, 50 foot hop, standing broad jump, beam balance, beam walk, throw for distance, side step, and accuracy throw) will be administered to children at six-month intervals for a period of three years. The six-year old children will be tested when six, seven and eight years; eight-year olds will be tested when eight, nine and ten years. Analyses will be based upon individual patterns of performance and development.
Duration: October 1963-May 1966.
Investigator(s): Jack F. Keogh, Ed.D., Assistant Professor of Physical Education, University of California, Los Angeles, Calif. 90024.
Cooperating group(s): National Institute of Mental Health, and National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Monograph summary at end of study; first phase of the study was normative in nature, including 436 children ages 6 through 9, and a monograph is in process to summarize this information.

18-C-10 PHYSICAL WORKING CAPACITY OF ADOLESCENTS

Purpose: To investigate maximum working capacities of adolescents (oxygen uptake per minute per kilogram body weight); to construct a nomogram for prediction of these maximal values from pulse reactions to submaximal steady-state work.
Subjects: 200 males and 200 females from local high schools.
Methods: Bicycle ergometer will be employed. Exercise EKG's and physiologic age of subjects, determined by means of hand-wrist X-rays, will be recorded.
Duration: July 1963-June 1966.
Investigator(s): Howard G. Knuttgen, Ph.D., Assistant Professor, School of Education, Boston University, Boston 15, Mass.
Cooperating group(s): Army Medical Research and Development Command, U. S. Department of Defense.

18-C-11 RELATIONSHIP BETWEEN GROWTH AND SELECTED PHYSICAL PERFORMANCES

Purpose: To determine over a three-year period: (1) changes in performances of subjects on AAHPER physical fitness tests; (2) changes in selected anthropometric measurements; (3) relationship between changes in anthropometric measures and changes in performance on fitness tests.
Subjects: Male students in grades 5 through 9.
Methods: Subjects will be tested and measured twice each year, the measures including weight, stature, stem length, limb length, soft tissue girths, and thickness of subcutaneous tissue.
Duration: Spring 1964-spring 1967.
Investigator(s): Conrad Eckstrom, Ph.D. Candidate, and Louis E. Alley, Ph.D.,

Professor and Head, Department of Physical Education, State University of Iowa, Iowa City, Iowa.
Publication: To be published in Research Quarterly (American Association for Health, Physical Education, and Recreation).

18-C-12 RELATIONSHIP BETWEEN SPECIFIC ASPECTS OF PHYSICAL DEVELOPMENT AND INTELLIGENCE OF CHILDREN

Purpose: To investigate the relationship between specific aspects of physical development and intelligence in children at the first grade level.
Subjects: All first grade students of Thomas Metcalf Laboratory School, Illinois State University. Two classes are matched groups of gifted children; the third class is a group of normal children selected by the criteria established by the admissions committee of the school.
Methods: Interrelationships will be drawn between measures of: (1) age to nearest month, height to nearest inch, weight to nearest half pound; (2) gross motor skills of running, throwing, and jumping as measured by a four-second run, overhand throw for distance, and a standing broad jump; (3) fine motor coordination as measured by a modification of the "Placing" and "Turning" tests of Minnesota Rate of Manipulation Test; (4) intelligence as measured by Stanford-Binet L-M.
Duration: March 1964-October 1970.
Investigator(s): Betty J. Keough, Ph.D., Associate Professor, and Evelyn L. Schurr, Ph.D., Assistant Professor, Department of Health and Physical Education, Illinois State University, Normal, Ill. (Reported by Paul Dohrmann, Ph.D., Assistant Professor of Health and Physical Education, Illinois State University.)
Publication: To be submitted to Research Quarterly; Illinois State University, Teacher Education.

18-C-13 DENTAL MORPHOLOGICAL VARIATION IN POPULATIONS

Purpose: Dentition studies.
Subjects: Amerinds.
Methods: Field studies of genetic parameters including teeth and blood; casts, photos, etc.
Findings: Inheritance patterns of tooth forms.
Duration: April 1963-March 1967.
Investigator(s): Albert A. Dahlberg, D.D.S., Associate Professor, Department of Anthropology, University of Chicago, Chicago 37, Ill.
Publication: To be submitted for journal publication.

18-C-14 A COMPARATIVE ANALYSIS OF TOOTH AND ARCH SIZES

Purpose: To test the theory that there are ethnic differences in tooth and arch sizes in children.
Subjects: Models of arches and deciduous teeth; all records of 100 North American Negro boys and same records of 100 North American Caucasian boys.
Methods: Measurement of deciduous teeth and arches on models, permanent teeth of some subjects on periapical X-rays, and erupted permanent teeth of same subjects on models.
Duration: March-December 1964.
Investigator(s): Matthew Mitchell, D.D.S., Assistant Professor of Orthodontics, College of Dentistry, Howard University, Washington, D. C.
Cooperating group(s): Institute for Child Growth, Philadelphia.
Publication: To be submitted to an orthodontic journal.

18-C-15 LONGITUDINAL STUDY OF GROWTH AND DEVELOPMENT OF THE DENTITION

Purpose: To help determine the etiology of malocclusion.
Subjects: Children followed from deciduous dentition to permanent.
Methods: Diagnostic records taken annually; full series - periapical films, cephalogram, lateral plate, portrait, intra-oral Kodachrome, carpal index, and models.
Duration: 1960-1970.
Investigator(s): I. Steur, D.D.S., N. A. Di Salvo, D.D.S., Ph.D., and Henry I. Nahoum, D.D.S., Division of Orthodontics, Columbia-Presbyterian Medical Center, New York, N. Y.

18-C-16 A COMPARATIVE STUDY OF SELECTED TRAITS OF MALOCCLUSION

Purpose: To collect records suitable for evaluation of certain principles or concepts which have been hypothesized and tentatively accepted as bases for teaching orthodontic and pedodontic principles to students; to test certain concepts for which adequate clinical evidence is lacking.
Subjects: Selected group of patients in pedodontic clinic.
Methods: Obtain and analyze serial set of records for each subject, including dental casts, facial and oral photographic records, cephalometric and intraoral radiographic records, and past and current oral and general health records.
Duration: November 1962-indefinite.
Investigator(s): William Foster O'Meara, D.M.D., Associate Professor, William G. Goodale, D.D.S., Professor, and George F. Andreasen, D.D.S., Assistant Professor, College of Dentistry, State University of Iowa, Iowa City, Iowa.

18-C-17 "NURSING BOTTLE DENTITION"

Purpose: To determine: (1) frequency of occurrence; (2) relationship of amount of decay to length of time child spends nursing from bottle; and (3) relation of infection to upper respiratory infections.
Subjects: Children in pedodontic clinic at New York University Hospital and at Beth Israel Hospital Dental Clinic.
Methods: Interviews; examination of hospital records and pediatric consultations; histologic examination of affected teeth.
Findings: Preliminary investigations indicate children going to sleep with nipple of nursing bottle in mouth show a marked tendency toward a characteristic pattern of decay and erosion, characterized by large carious lesions on all teeth in the mouth except lower anteriors.
Duration: September 1963-not reported.
Investigator(s): Stephen J. Moss, D.D.S., M.S., Instructor in Pedodontics, College of Dentistry, New York University, New York, N. Y.

Perceptual, cognitive, and motor

18-D-1 CORRELATION BETWEEN COGNITIVE-MOTOR DEFICITS IN CHILDREN AND LEARNING DISABILITIES

Purpose: To test hypothesis that deficits in major perceptual-cognitive-motor functions have a relationship to learning difficulties and behavior problems in school.
Subjects: Children in grades 1, 3, and 5 of a public school system; 40 at each grade level; 40 in special classes for mentally retarded.

Methods: Subjects are given complete perceptual-cognitive-motor battery developed at Lafayette Clinic, with measures of visual, auditory and tactile perception, fine motor control, gross motor development, etc., as well as achievement testing and teachers' behavior rating.
Duration: June 1962-indefinite.
Investigator(s): Jean S. Braun, Ph.D., Chief Psychologist, Children's Service; Eli Z. Rubin, Ph.D., Director of Rehabilitation; Lela Llorens, M.A., O.T.R., Head of Occupational Therapy; and Gayle Beck, M.Spec. Ed., Supervisor, School Department, Lafayette Clinic, 951 E. Lafayette St., Detroit, Mich.
Publication: Papers in preparation.

18-D-2 SPEECH, LANGUAGE, AND HEARING OF CHILDREN

Purpose: To develop a battery of speech, language, and hearing tests for three-year old children; to enable investigations correlating deficiencies in speech, language, and hearing with obstetric, pediatric, neurological, and psychological examinations and history; to study relationships between speech, language, and hearing measures at three years with failures in selected abilities such as reading and vocabulary at seven years.
Subjects: 510 children followed thus far from birth to age 3.
Methods: 12 collaborating institutions, coordinated through Perinatal Research Branch, are collecting data. Subjects identified prenatally with recording of events during pregnancy and delivery by the obstetrician; examinations accomplished at four months by a pediatrician, at eight months by a psychologist, at 12 months by a neurologist. In the present phase, a test battery administered to three-year old children, has screened for speech, language, and hearing defects and is now being analyzed. Psychological testing will be accomplished at four years. Abilities such as reading, language usage, etc. will be explored at approximately seven years.
Duration: 1964-1965.
Investigator(s): Frank Lassman, Ph.D., and Elaine Engelbart, M.A., Department of Physical Medicine and Rehabilitation, Medical Center, University of Minnesota, Minneapolis, Minn. (Reported by Frederic J. Kottke, M.D., Ph.D., Professor and Head, Department of Physical Medicine and Rehabilitation, Medical Center, University of Minnesota.)
Cooperating group(s): Perinatal Research Branch, National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-D-3 BEKESY AUDIOMETRY WITH CHILDREN

Purpose: To evaluate effects age and intelligence have upon Bekesy audiometry--thresholds, tracing patterns, and reaction to interrupted and continuous presentation of stimulus.
Subjects: 15 children for each of three age groups: 4 to 6 years; 6 to 8 years; and 8 to 10 years. There will be three such groups with normal hearing and three with hearing loss, all matched in terms of age, sex, and I.Q.
Methods: Each child will be tested with continuous and interrupted stimulus, as well as with discrete and continuous frequencies.
Duration: September 1964-August 1966.
Investigator(s): John J. O'Neill, Ph.D., Director, Speech and Hearing Clinic, and Earl Stark, Ph.D., Assistant Professor, University of Illinois, Champaign, Ill.
Publication: To be submitted to Journal of Speech and Hearing Research.

18-D-4 RESPONSES OF THE HUMAN NEONATE TO REPEATED SENSORY STIMULATION

Purpose: To measure response in newborns to repeated sound stimulation varying in duration, intensity, and intervals between stimulus presentations.
Subjects: Normal, full-term newborns ranging from 1 to 5 days in age, divided into 2 groups of 10 each, and tested for 2 days; 2 control groups.
Methods: Infants are tested in a temperature controlled, sound attenuated laboratory. Stimulus presentations, durations, and intervals are programmed and automatically recorded on an ink-writing oscillograph; heart rate is picked up from precordial leads by suction electrodes and is recorded both through a cardiotachometer and the electrocardiogram; respiration is detected by a mercury strain gauge taped at the costal margin. One group received a 10-second tone for 15 trials on day one, with a 90-second interstimulation interval and a 2-second stimulus for 15 trials on day two. Procedure was reversed for second group. Control groups, matched for second-session age of subjects in first experiment, were presented with same stimuli.
Findings: With a stimulus lasting 10 seconds, the heart rate response habituated in three trials from an acceleration maximal at 16.5 beats to one maximal at 8.4 beats. There was no spontaneous recovery after 24 hours. With a stimulus lasting 2 seconds, acceleration was briefer and there was no significant habituation of response. Older infants of control experiment showed a similar difference between the 2- and 10-second stimuli, indicating that diminished response to 10-second stimulus on second day was not a function of age.
Duration: July 1963-September 1966.
Investigator(s): Frances Graham, Ph.D., Associate Professor, and Rachel Keen, Ph.D., Postdoctoral Fellow, Medical School, University of Wisconsin, Madison, Wis.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: *American Psychologist* (in press).

18-D-5 THE DEVELOPMENT, IN INFANTS, OF THE ABILITY TO DISCRIMINATE PATTERN GRADIENTS AS A CUE TO DEPTH

Purpose: To test the hypothesis that children will avoid a variegated pattern as if avoiding actual depth.
Subjects: Infants, able to crawl.
Methods: Walk and Gibson's visual cliff--varying pattern under "deep side" rather than actually varying depth of surface.
Duration: June 1964-June 1965.
Investigator(s): James C. Mancuso, Ph.D., and Morris E. Eson, Ph.D., Chairman, Department of Psychology, State University of New York, Albany, N. Y.
Cooperating group(s): Research Foundation, State University of New York.
Publication: To be submitted to a developmental journal.

18-D-6 PRELIMINARY INVESTIGATION OF RELATIONSHIP OF INDIVIDUAL'S VISUAL SPACE PERCEPTION AND KINESTHETIC SPACE

Purpose: To investigate pattern of changes of visual space and kinesthetic space.
Subjects: 28 fourth grade pupils in a local public school.
Methods: Using a mirror arrangement, localizing a virtual image without visual feedback of hand localization.
Findings: Experiment shows that there are definitely individual patterns of visual-kinesthetic matching. Attempt now is to try to evaluate the difference in patterns.
Duration: January 1964-June 1965.

Investigator(s): John W. Streff, O.D., Director of Visual Research, Gesell Institute of Child Development, New Haven 11, Conn.
Cooperating group(s): Gesell Institute of Child Development Visual Research Fund.

18-D-7 STUDIES OF PERCEPTUAL DEVELOPMENT

Purpose: To measure age changes in susceptibility to well known visual-geometric illusions in nursery school children.
Subjects: Nursery school children in Ingham County.
Methods: PSE's on five optical-geometric illusions measured by the Up-and-Down Method.
Duration: September 1964-June 1965.
Investigator(s): Charles Hanley, Ph.D., Professor of Psychology, Michigan State University, East Lansing, Mich.
Publication: To be published upon completion of study.

18-D-8 AUDITORY BEHAVIOR IN HUMAN NEONATES

Purpose: (1) To determine, under well controlled conditions, the effects of signal complexity, duration, and frequency upon incidence of response, and distribution of four kinds of reflex behavior during response; (2) to determine whether any systematic changes in behavior are found during first four days of life; and (3) to establish criteria for observer judgments of response by comparing objective ECG findings with observer judgments based upon motion picture data.
Subjects: 30 human neonates, each seen daily (same time of day) during first four days of life.
Methods: A 30-signal battery consisting of: (1) a 500 cps pure tone; (2) a 500-1000 cps band-pass; (3) 4000 cps pure tone; (4) 4000-4500 cps band-pass; and (5) white noise will be programmed on tape and presented for 300 msec. and (white noise only) one minute. Intervals during which motion picture data will be obtained will be controlled by programmer, and response to auditory stimulation will be classified on basis of motor, eye, arousal, and orienting reflexes. Differential effects associated with age will be analyzed in reference to these factors and also two quantitative measures of temporal relations will be derived: (1) response-latency, i.e., the time lapse between presentation of a stimulus and onset of a response pattern; and (2) response-time, i.e., the time consumed by given response patterns. Behavioral data will be compared with ECG findings derived from associated measures.
Duration: June 1964-May 1967.
Investigator(s): Rita B. Eisenberg, Sc.D., Director, Bioacoustic Laboratory, and David Baird Coursin, M.D., Director, Research Institute, St. Joseph Hospital, Lancaster, Pa.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Initial report on pilot findings will appear in Journal of Speech and Hearing Research, September 1964. Other reports on early research are in preparation.

18-D-9 AUDITORY PERCEPTION OF MUSICAL SOUNDS BY CHILDREN IN THE FIRST SIX GRADES

Purpose: To study, by means of a series of closely related projects, the auditory perception of musical sounds. These would each deal with the perception of musical elements treated individually or in combinations and would involve perception of rhythm, melody, timbre, and harmony. Such investigations

would provide much needed information regarding possible growth stages in auditory perception, as well as information concerned with general musical development of children.
Subjects: Students randomly selected from grades 1 through 6, with approximately equal numbers for each grade level.
Methods: Specially designed tests are administered to each subject; tests are tape recorded, as are pupil responses. Data are then subjected to intensive analysis.
Duration: August 1960-July 1965.
Investigator(s): Robert G. Petzold, Ph.D., Professor of Music and Education, University of Wisconsin, Madison, Wis.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: To be issued as a monograph; a series of articles are planned for publication in appropriate professional journals.

18-D-10 PERCEPTUAL REWARDS IN NORMAL AND DEVIANT DEVELOPMENT

Purpose: To study the role of perceptual experience generated by behavior in the cognitive development of normal, retarded, and disturbed infants and young children.
Methods: Methods of operant behavior analysis are adapted to record responses that bring about controlled visual and auditory events in child's normal environment. In studies with infants, perceptual feedback is controlled with a view toward identifying acquisition of reality concepts according to scheme proposed by Piaget. Studies with normal and retarded children at preschool and older age levels measure behavior sustained by perceptual feedback at different levels of variability, complexity, and predictability. Means are sought to apply experimental findings to development of automated diagnostic, therapeutic, and training procedures with handicapped children.
Duration: 1963-1966.
Investigator(s): Jane W. Kessler, Ph.D., Director, and Bernard Z. Friedlander, Ph.D., Research Associate, Mental Health Development Center, Western Reserve University, Cleveland 6, Ohio.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-D-11 STUDIES OF SELECTIVE ATTENTION

Purpose: To trace developmental trends in the ability to select from among competing stimuli; to note age changes in effects of distraction on performance of a variety of cognitive tasks; and to contrast several classes of distractors.
Subjects: Children ranging in age from 5 to 14.
Methods: Presentation of taped distractors via headphones while subject performs such tasks as short-term memory, incidental learning, word associations, and repeating of auditory message.
Findings: Selective listening for one of two incompatible messages improves with age. Redundancy in message improves selective listening; this is truer for older than younger children. Distraction has a significant effect on memory for task-relevant material, but not for incidental material, although there is also a tendency for distraction to reduce incidental learning at higher age levels. Amount of incidental learning declines with age on a task where incidental material has high salience.
Duration: January 1964-September 1967.
Investigator(s): Eleanor E. Maccoby, Ph.D., Associate Professor of Psychology, Stanford University, Stanford, Calif.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: To be published in Journal of Experimental Psychology and/or Child Development.

18-D-12 DEVELOPMENTAL CHANGES IN PREFERRED "READING" ORDERS

Purpose: To describe the preferred orders in which preschool children "read" sequences of pictures arranged in different spatial configurations.
Subjects: Middle-class children, 3 to 5 years of age, from local nursery schools.
Methods: Sequences of pictures arranged vertically, horizontally, in the form of a cross, and in other spatial configurations are presented to the child, and he is asked to name all the things he sees. Data will be scored in terms of starting position, degree and kind of systematization used. In addition, estimates of handedness are obtained.
Findings: A completed pilot study has demonstrated feasibility of methods, and has indicated that even very young children show some systematic organization of simple spatial arrays. Collection of data using final set of arrays is just beginning.
Duration: January 1964-March 1965.
Investigator(s): Lila Ghent, Ph.D., Research Scientist, Department of Psychology, George Washington University, Washington, D. C. 20006.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be published in a psychological journal.

18-D-13 PERCEPTION OF CHARACTER, THEME, AND SETTING IN CHILDHOOD

Purpose: To determine developmental trends in children's perceptions of character, theme, and setting in pictorial materials.
Subjects: Elementary school children.
Methods: A set of 27 drawings representing all possible combinations of three themes, three settings, and three characters is used. Subjects are shown cards representing all possible combinations and asked to sort cards into three piles.
Findings: Preliminary results suggest that theme, or action, is first feature to stand out developmentally and that this is followed by character with setting perceived last with respect to age. Individual differences with respect to ability to shift bases of categorization were also observed as well as age differences in ability to maintain sorting set throughout examination.
Duration: June 1964-January 1965.
Investigator(s): David Elkind, Ph.D., Associate Professor of Psychology, University of Denver, Denver 10, Colo.
Publication: Child Development.

18-D-14 RELATIONSHIP BETWEEN PERCEPTUAL AND COGNITIVE DEVELOPMENT

Purpose: A pilot study to develop instruments to study perceptual and cognitive development longitudinally in young children.
Subjects: Nursery school children, 3 to 5 years of age.
Duration: June 1964-May 1965.
Investigator(s): Freda Gould Rebelsky, Ph.D., Assistant Professor of Psychology, and Philip Kubransky, Ph.D., Associate Professor, Boston University, Boston, Mass.
Cooperating group(s): Office of Education, U. S. Department of Health, Education,, and Welfare.
Publication: Planned in Child Development.

18-D-15 COGNITIVE DEVELOPMENT

Subjects: Children, 3 to 11 years.
Methods: Individual testing for perception and learning: (1) object discrimination; (2) left-right discrimination; and (3) perception of the vertical.
Findings: Postural and space orienting cues facilitate object discrimination. Children show same adaptation to body tilt as do college women but not as do college and adult men; no clear sex difference shown in children.
Duration: 1963-1964.
Investigator(s): Jerome E. Podell, Ph.D., Associate Professor of Psychology, San Francisco State College, San Francisco 27, Calif.
Cooperating group(s): San Francisco State College.

18-D-16 A GROUP OF STUDIES ON COGNITIVE DEVELOPMENT

Purpose: To study information processing and mechanism of concept attainment in children.
Subjects: Children, 2 to 16 years.
Methods: Experiments in absolute judgment, inductive concept attainment, etc.
Duration: Continuing.
Investigator(s): Sonia F. Osler, Ph.D., Associate Professor of Medical Psychology and Pediatrics, School of Medicine, Johns Hopkins University, Baltimore, Md. 21205.
Cooperating group(s): National Science Foundation; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-D-17 MEDIATED STIMULUS GENERALIZATION IN CHILDREN

Purpose: To study effects of such variables as habit strength, drive level, parental attitudes, sex differences, and training intensities upon mediated stimulus generalization in children; also, to study effects of MSG on transfer of training to a motor task.
Subjects: 96 children in grade 4; 115 children in grade 6.
Methods: Mediated stimuli to be employed are verbs of varying degrees of hostile connotation, scaled by subjects; mediated stimuli will be used in relation to a handle-pulling response whose amplitude, frequency, and perhaps latency will constitute dependent variables.
Duration: April 1963-April 1965.
Investigator(s): William J. Meyer, Ph.D., Associate Professor, and Arthur Orgel, Ph.D., Assistant Professor, Department of Psychology, University of Pittsburgh, Pittsburgh 13, Pa.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-D-18 A DEVELOPMENTAL AND NORMATIVE STUDY OF WORD ASSOCIATIONS IN CHILDREN

Purpose: To investigate developmental variations in oral word associations.
Subjects: 1056 children, grades 1 through 6.
Methods: Besides investigation of developmental variations in oral word associations, comparison between oral and written methods of administration was provided by gathering an additional sample of 526 written word association protocols from children in grades four through six. Further comparisons were made between present data and existing adult and child norms. Stimulus list was original Kent-Rosanoff word association list.

Findings: There was increased popular responding with age (i.e., more children at higher ages gave same associations to stimulus words than at lower). There was increased commonality of response with age and increased proportions of responses categorized as logical and mature. Ages and sex differences on parameters of mature responding were found favoring brighter children and girls. Oral and written methods yielded adequate agreement.
Investigator(s): Sister Serena Sheehy (Ph.D. Candidate, Catholic University of America), Director, Kennedy Child Study Center, St. Joseph's Hospital, Santa Monica, Calif. (Reported by Norman A. Milgram, Ph.D., Associate Professor of Psychology, Catholic University of America, Washington 17, D. C.)
Publication: Dissertation submitted to Catholic University, 1964.

18-D-19 LONGITUDINAL STUDIES OF HUMAN DEVELOPMENT

Purpose: To study significance and antecedents of conceptual strategies in young children, especially the tendency to display fast or slow decision times; to study consequents of individual differences in infant behavior patterns.
Subjects: Infants, preschool, and school age children.
Methods: Observations; autonomic reactions; test scores.
Findings: Children show dramatic intertask stability and long-term continuity on decision times in problems with high response uncertainty. Infants, 6 to 13 months, display clear preferences for humanoid visual patterns; there are stable, individual differences in distribution of attention.
Duration: September 1960-indefinite.
Investigator(s): Jerome Kagan, Ph.D., Chairman, Department of Psychology, Fels Research Institute, Antioch College, Yellow Springs, Ohio.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: *Psychological Monographs*, 1964.

18-D-20 THE GROWTH OF COGNITIVE ABILITIES IN YOUNG CHILDREN

Purpose: To study the influence of language on development of problem-solving and conceptual ability in young hearing and deaf children.
Subjects: Deaf and hearing nursery school children, 3 to 6 years of age.
Methods: Children are presented a series of discrimination tasks employing a unifying concept (e.g., 1 versus 2 lights; 1 versus 2 sounds); tasks are generally presented in differing sensory modalities to prevent transfer on basis of physical generalization. A concept of number was required for transfer of a solution across different sensory modalities.
Findings: Deaf children were not inferior to hearing children on type of simple concepts employed at this age.
Duration: January 1963-December 1966.
Investigator(s): Marion Blank, Ph.D., Instructor, and Wagner H. Bridger, M.D., Assistant Professor, Department of Psychiatry, Albert Einstein College of Medicine, Yeshiva University, New York 61, N. Y.

18-D-21 THE RELATION OF EYE-HAND COORDINATION AND COLOR-MATCHING TO HANDWRITING AND SMALL MUSCLE MOVEMENTS IN FIRST GRADE CHILDREN

Purpose: To investigate coordination and small muscle movements.
Subjects: 149 preschool children later accepted in a private school.
Methods: Mental ability was measured by the WISC and reading readiness by the Metropolitan Reading Readiness Test. Teacher ratings of children's handwriting and small muscle performance in drawing, cutting, etc. were correlated with scores on Moore Eye-Hand Coordination and Color Matching Test for preschool

children, I.Q. and reading readiness tests, and Goddard Seguine Form Board Scores.
Findings: The following correlation coefficients were noted: Moore Speed with Goddard Seguine, .46; Moore Color Matching with Reading Readiness, .23; with Number Readiness, .22; with Total Readiness, .30; with Wechsler Verbal I.Q., .16; with Wechsler Performance I.Q., .31; with Wechsler Total I.Q., .32. Teacher ratings of poorest and best coordinated differentiated the groups significantly.
Duration: 1962-1966.
Investigator(s): Joseph E. Moore, Ph.D., Regents Professor of Psychology, Georgia Institute of Technology, Atlanta, Ga.
Cooperating group(s): Lovett Episcopal Day School.

18-D-22 MOVEMENT PATTERN CHECKLISTS: LONG FORM AND SHORT FORM, WITH PROFILE

Purpose: To provide a measuring device for objectified subjective judgment of movement pattern elements and characteristics of children, with special reference to the mentally retarded and other exceptional children; to provide an evaluative instrument for measuring progress of special education children in gross motor therapy; to provide an instrument to objectify evaluation of exceptional children's motor behavior in order to facilitate a comparative basis both in investigations relative to exceptional children and in work with individual children and groups; and possibly to assist in quantifying and qualifying certain measures of motor behavior of children distinct from those elements commonly called motor ability (movement patterns).
Subjects: Children in a special motor therapy program for underachieving public school children; pupils in local schools and in several special schools and programs for exceptional children.
Methods: Literature review for relevant information; observation and identification of patterns; preparation of preliminary checklists; pilot study with children and suggestions from judges; analysis of cinemagraphic records of movement patterns; revisions.
Findings: Preliminary instruments appear to be feasible and probably valid.
Duration: September 1962-June 1965.
Investigator(s): Barbara B. Godfrey, Ph.D., Professor of Physical Education, University of Missouri, Columbia, Mo.
Cooperating group(s): Indiana State Board of Health; Achievement Center for Children, Purdue University; Lafayette School System; Wabash School for Exceptional Children, Lafayette, Ind.; Woodhaven School for Exceptional Children, Columbia, Mo.
Publication: To be published for use locally by Achievement Center, Purdue University; to be submitted to Research Quarterly (American Association for Health, Physical Education, and Recreation) or Journal of Exceptional Children.

18-D-23 ACTIVITY LEVEL AND BEHAVIOR PATHOLOGY IN CHILDREN

Purpose: To measure objectively the general activity level of children.
Methods: A room will be used containing a standardized set of playthings designed in a manner which will allow automatic electrical recording of child's manipulation of them. Reliability and validity of technique will be evaluated; following this, it will be used to measure effects of drugs, environmental stimuli, and need states.
Investigator(s): Morton Rieber, Ph.D., Assistant Professor, Departments of Pediatrics and Psychiatry, and Homer F. Weir, M.D., Assistant Professor, Department of Pediatrics, College of Medicine, Baylor University, Houston 25, Tex.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Communication

18-E-1 THE RELATIONSHIP OF LANGUAGE DEVELOPMENT TO SOCIAL CLASS AND INTELLIGENCE

Purpose: To survey the cognitive and linguistic abilities of lower and middle class children; to identify and measure degree to which salient aspects of physical, social, and cultural environment foster or inhibit the development of specific cognitive skills and language abilities.
Subjects: A sample of 292 children, grades 1 and 5, from 12 New York City public schools, stratified by social class, race characteristics, and sex within the two grade levels.
Methods: (1) An extensive battery of 24 tests designed to measure specific cognitive and language abilities and consisting of standardized tests of reading and intellectual abilities was administered. In addition, a number of tests were constructed at the Institute to measure such component aspects of language ability as labeling, classifying, and relation; tests of concept formation and sensory discrimination were also included. (2) Information for each subject on approximately 50 family and social-environmental variables was obtained from interviews conducted with parents or guardians and from questionnaires mailed to parents. (3) Scores on the cognitive and language measures were analyzed by correlation techniques; they were done separately for each grade level in order to permit developmental comparisons within the sample. Correlation matrices for each grade level were subjected to factor analysis. (4) Analyses of variance were then done using major demographic and specific social background variables as independent variables. Dependent variables were the "factor marker" variables in addition to other selected performance measures.
Findings: A number of specific family and social background variables were found to interact significantly with social class and race in affecting level of performance on the cognitive and language measures.
Duration: October 1959-November 1965.
Investigator(s): Martin Deutsch, Ph.D., Director, Institute for Developmental Studies, Department of Psychiatry, New York Medical College, New York 29, N. Y. (Reported by Fay Boulware, Administrative Coordinator, Institute for Developmental Studies.)
Cooperating group(s): Taconic Foundation.
Publication: Paper read at American Psychological Association, Philadelphia, September 1963; submitted to Journal of Social Psychology. Teachers Journal, in press, Spring 1964. Monograph No. 2, Ithaca, N. Y.: The Society for Applied Anthropology, 1960. Papers read at American Orthopsychiatric Association, Chicago, March 1964. American Journal of Orthopsychiatry, 33:5:813-822, 823-831, 1963; another article in press. Journal of Social Issues, 20:24-35, 1964. Paper read at Arden-House Conference on Preschool Enrichment of Socially Disadvantaged Children, Harriman, N. Y., December 1962; Merrill-Palmer Quarterly, in press, Spring 1964. A comprehensive report of the study is being prepared in paperback form and will be available in 1965.

18-E-2 DELAYED LANGUAGE DEVELOPMENT: AUDITORY INPUT FACTORS

Purpose: To study auditory input receptor, effector, and control factors.
Subjects: Preschool-age children with delayed language and speech, excluding those who are primarily motor-affected, deaf in a classical sense, grossly intellectually deficient, schizophrenic, or epileptic; a control group.
Methods: A profile of auditory input for each subject will be constructed in terms of a six-point scale of factors reflecting receptor-effector-control aspects; profiles will be evaluated in terms of similar analyses of control

group. In most regards, each child in study group will be his own control. Series of structured problem-solving experiences are given, beginning with each child at first level of failure relative to developmental scale, the level of failure having been determined by diagnostic appraisal. Each child will be followed for three years, through preschool development period, in order to measure his achievement in each hierarchy of six-point scale relative to relations between auditory input and language development.
Duration: Not reported-August 1965.
Investigator(s): William G. Hardy, Ph.D., Associate Professor of Environmental Medicine, and staff, School of Hygiene and Public Health, Johns Hopkins University, Baltimore 5, Md.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-E-3 THE ACQUISITION OF SYNTAX

Purpose: To study the acquisition of syntax.
Subjects: 5 children between ages of 1.5 and 4 years are involved in long-term study; larger numbers are involved in short-term experiments.
Methods: Samples of child's speech are collected over a long period of time. Radio transmission and a concealed tape recorder are used. Parents are not aware of time of recording. Experiments with young children are performed by manipulating syntactic structure of utterances and analysis of the relationship of various syntactic formats to such responses as imitation, etc.
Duration: September 1963-September 1966.
Investigator(s): Harold A. Rashkis, M.D., Ph.D., Director, Clinical Research, and Lila R. Gleitman, M.A., Eastern Pennsylvania Psychiatric Institute, Henry Ave. and Abbottsford Rd., Philadelphia, Pa.
Cooperating group(s): Pennsylvania State Department of Public Welfare; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To appear in linguistic and psychological literature.

18-E-4 BEHAVIORAL CORRELATES OF INFANT VOCALIZATIONS

Purpose: To utilize recent methods of linguistic analysis in a longitudinal study of development of vocal characteristics in infants; to investigate later behavioral correlates (speech and intellectual performance) of these vocalizations. Specifically: to adapt methods of linguistic analysis to study of infant vocal development; to measure relationship between pre-linguistic vocalizations and later speech; and to determine feasibility of using infant vocalizations as a predictor of later intellectual level.
Subjects: 50 infants, followed from 1 to 36 months of age.
Methods: Spontaneous vocalizations of subjects will be tape recorded in half hour sessions at monthly intervals (at biweekly intervals during "babbling" stage), beginning with infants at age of 1 month and continuing to 18 months. Changes with age of various linguistic and vocal measures will be assessed; infant vocal characteristics will be correlated with vocabulary measures at ages 18 and 36 months, with results of a speech evaluation obtained at 36 months. Vocal characteristics will be correlated with Stanford-Binet I.Q. obtained at 36 months.
Duration: January 1964-December 1967.
Investigator(s): Egan A. Ringwall, Ph.D., Associate Professor, Hayne W. Reese, Ph.D., Associate Professor, and Norman N. Markel, Ph.D., Assistant Professor, Department of Psychology, State University of New York at Buffalo, Buffalo, N. Y.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-E-5 PHYSIOLOGICAL STUDIES, INCLUDING SOUND SPECTROGRAPHY, OF INFANT VOCALIZATION

Duration: 1961-indefinite.
Investigator(s): James F. Bosma, M.D., Chief, Oral and Pharyngeal Development Section, National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.

Learning

18-F-1 LABORATORY INVESTIGATIONS OF DISCRIMINATION SKILLS UNDERLYING ASPECTS OF HUMAN LEARNING

Purpose: To develop methods of measuring various aspects of visual and auditory perceptual processes; to measure functions which underly all perceptual discrimination (e.g., activation and attentional processes); to experiment with and develop specific alphabet pre-reading techniques.
Subjects: Children, 4 and 5 years old, from socially disadvantaged backgrounds enrolled in Harlem public schools.
Methods: A battery of auditory and visual tests will be developed and administered to a sample of lower class children. A variety of separate studies will be carried out using alphabet boards and the Edison Responsive Environments Typewriter to develop and contrast training using their different types of equipment.
Duration: July 1964-June 1967.
Investigator(s): Cynthia P. Deutsch, Ph.D., Associate Professor, and Larry Gotkin, Ed.D., Senior Research Associate, Institute for Developmental Studies, Department of Psychiatry, New York Medical College, New York 29, N. Y. (Reported by Fay Boulware, Administrative Coordinator, Institute for Developmental Studies.)

18-F-2 DEVELOPMENTAL STUDIES OF DISCRIMINATION LEARNING

Purpose: To investigate level of performance on simultaneous and successive discrimination learning problems of elementary school children; to investigate effect of type of reinforcement on performance; and to investigate role of distance between stimulus and response loci on learning.
Subjects: Elementary school children, kindergarten through grade six.
Methods: Factorial design, involving three stimulus simultaneous and successive discrimination learning problems under one of four reinforcement conditions, and under one of three distance relationships. Reinforcement conditions are "right", "wrong", "right" and "wrong" and buzzer indicating right response. Distances between stimuli and response loci are 6", 3", and 0".
Duration: October 1963-August 1964.
Investigator(s): Frances Degen Horowitz, Ph.D., Associate Professor and Research Associate, Bureau of Child Research, University of Kansas, Lawrence, Kans.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication is planned.

18-F-3 INFANT LEARNING AND PATTERNS OF FAMILY CARE

Purpose: To study longitudinally 100 children from birth to three years of

age, using laboratory learning procedures as major dependent variables and various types of physical and interpersonal family attributes as major independent variables. In addition, the effects of a carefully programmed group care environment will be observed. Major concern is with maximization of intellectual potential and with determination of the most effective time for offering environmental enrichment programs.
Subjects: 100 children, approximately half of whom will be from lower socioeconomic status families and half of whom will be from "potential" middle class families currently living under conditions of economic privation.
Methods: (1) Measurement of learning patterns of the children by means of traditional laboratory learning techniques; (2) measurement of developmental level by published tests and experimental procedures; (3) assessment of stimulation potential of the home via repeated home visits; (4) assessment of parental attitudes toward learning and parental ideas of how children learn and how they can be taught; (5) assessment of nature of emotional relationship that develops between mother and infant; and (6) design of a program of day care for children in the study whose mothers will go to work and seek substitute care for their children.
Duration: April 1963-1969.
Investigator(s): Bettye M. Caldwell, Ph.D., Research Associate, and Julius B. Richmond, M.D., Chairman, Department of Pediatrics, Upstate Medical Center, State University of New York, Syracuse, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: To be published in regular scientific and professional journals.

18-F-4 THE RELATION OF CHARACTER TO LEARNING IN THE FIRST SIX SCHOOL YEARS

Purpose: To study the effect of character development on learning.
Subjects: 12 children at the Frankford Friends School.
Methods: Subjects studied serially for six years by a psychologist, a psychiatrist, and teachers. Standard tests were compared over six years to evaluate factors affecting learning (i.e., teacher attitudes and family trauma). Behavioral observations of character were made.
Findings: I.Q. was found to be significantly variable and to show a marked increase from the first to the sixth grades. Compulsive defenses often aided learning in children who had previously been unable to cope with their anxiety. Character tends to remain stable and is not affected by different teachers; learning patterns in boys and in girls differ.
Duration: 1957-1965.
Investigator(s): Theodore B. Cohen, M.D., Consulting School Psychiatrist, Margaret P. Morgan, School Psychologist, and Reba S. Lammey, B.S., Principal, Frankford Friends School, Penn and Orthodox Sts., Philadelphia, Pa.
Publication: Probably publication in Archives of Psychiatry, 1965.

18-F-5 LEARNING STRUCTURES AND PUPIL CHARACTERISTICS

Purpose: To determine various pupil characteristics as they relate to learning structures.
Subjects: Students in grades 7, 8, and 9.
Duration: July 1964-June 1967.
Investigator(s): Marvin D. Glock, Ph.D., Professor of Educational Psychology, School of Education, Cornell University, Ithaca, N. Y.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

18-F-6 VALIDATION OF DATA ON COGNITIVE VISUAL FEEDBACK

Purpose: To re-analyze data on teacher perception of cognitive visual feedback from students.
Methods: Content analysis of visual records (films) of high school student learning; comparison with previously secured ratings by teachers; multiple regression analyses of teacher coding previously secured.
Duration: June-October 1964.
Investigator(s): Nathan Maccoby, Ph.D., Professor of Mass Communication, and Henry Breitrose, M.A., Instructor in Communication and Research Associate, Institute for Communication Research, Stanford University, Stanford, Calif.; J. Jecker, Ph.D., Assistant Professor of Psychology, University of Texas, Austin, Tex.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: "Sound Film Recordings in Improving Classroom Communication - Experiments in Non-Verbal Communication," Institute for Communication Research, Stanford University.

Intelligence, thought, and problem solving

18-G-1 LONGITUDINAL CHANGES IN I.Q. AS MEASURED BY THE CALIFORNIA SHORT-FORM TEST OF MENTAL MATURITY

Purpose: To investigate deviations in I.Q. scores which occur in the elementary school.
Subjects: 156 boys and 158 girls in public elementary school.
Methods: Subjects were initially tested in the third grade using the California Short-Form Test of Mental Maturity '50 S Form. They were subsequently tested at two-year intervals as fifth and seventh grade pupils. Difference scores, both group and individual, are being investigated.
Findings: Preliminary findings indicate wide fluctuations in individual I.Q. scores beyond that explanable by measurement error.
Duration: September 1963-spring 1965.
Investigator(s): Carmen J. Finley, Ph.D., Director of Research, and Jack M. Thompson, M.A., Director of Guidance, Sonoma County Schools, 2555 Mendocino Ave., Santa Rosa, Calif.
Publication: To be submitted for publication when completed.

18-G-2 FACTORS RELATED TO CHANGE IN MENTAL TEST PERFORMANCE

Purpose: To identify demographic and familial factors related to increase or decrease in I.Q. from 6 to 12 and from 12 to 17 years of age.
Subjects: 500 subjects from 5 longitudinal studies (Berkeley Growth, Berkeley Guidance, Oakland Growth, Child Research Council-Denver, and Fels Research Institute), the data for whom are combinable for variables studied.
Methods: Basically correlational, using analysis of variance and Chi-square to determine relationships between I.Q. change and background characteristics.
Duration: October 1962-October 1965.
Investigator(s): Ann Haeberle, Ph.D., Assistant Professor, Brooklyn College, Francis H. Palmer, Ph.D., Professor, Graduate School, City University of New York, New York, N. Y., and Jerome Kagan, Ph.D., Chairman, Department of Psychology, Fels Research Institute, Antioch College, Yellow Springs, Ohio.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Probably a monograph, possible a book, and articles in professional journals.

18-G-3 A FACTOR ANALYTIC COMPARISON OF THE PERFORMANCE OF NORMALS AND RETARDATES ON THE WECHSLER INTELLIGENCE SCALE FOR CHILDREN

Purpose: To add further confirmatory evidence to the theory that there are qualitative differences in the structure of abilities between normals and retardates and to identify, compare, and contrast these abilities by means of factor analysis.
Subjects: Data from approximately 150 subjects on 11 subtests in the WISC (Wechsler, 1949) will be selected from the Human Genetics Longitudinal Study of Intelligence (Osborne, 1963) to comprise a normal group. Similar data for a retarded group will be selected from Ainsworth's study (1960). Both groups will be matched for sex and Wechsler Test Age.
Methods: In order to yield more variables and therefore larger correlation matrices, the 11 subtests will be split according to a method proposed by Saunders (1959), thus providing a method capable of yielding as many dimensions as there are subtests, but that does not force this result. Matrices will be factor analyzed by a method proposed by Kaiser (1959), which permits two important criteria, i.e., simple structure and factorial invariance. Factor structure of the two groups will be analyzed to further identify and describe intellectual factors of normals and retardates.
Investigator(s): R. Travis Osborne, Ph.D., Professor of Psychology, and Lance Hemberger, University of Georgia, Athens, Ga.

18-G-4 A FACTORIAL STUDY OF THE DIMENSIONALITY OF INTELLIGENCE TEST PERFORMANCE OF CHILDREN AS A FUNCTION OF SUBCULTURE AND SEX: A LONGITUDINAL STUDY

Purpose: To determine stability of intellectual factors in same group of subjects as a function of maturation from preschool age through third grade; to relate the Development Hypothesis of Intelligence as proposed by Garret (1946), to intelligence test performance of subgroups classified by sex and subculture.
Subjects: Subjects represent all available members of a stratified random group who were originally tested at preschool level in 1961 and who were retested in spring of 1962. Group available for retesting in spring of 1964 has an approximately equal distribution of white and Negro subjects; representation by sex is approximately equal.
Methods: Wechsler Intelligence Scale for Children was primary instrument. Data factor analyzed using varimax criterion for rotation developed by Kaiser. In addition to analysis performed on total group, separate analyses are performed on subgroups classified by sex and then by subculture. Congruence correlations are computed between separate matrices and also between 1964 analyses and those made on data from previous testings.
Duration: 1961-1965.
Investigator(s): R. Travis Osborne, Ph.D., Professor of Psychology, and Jim Lindsey, University of Georgia, Athens, Ga.

18-G-5 INTELLIGENCE AND PERSONALITY OF INDIAN CHILDREN

Purpose: To obtain data useful in guidance of Indian children.
Methods: Psychological testing; adapted WISC.
Findings: Verbal intelligence superior by about 10 percent over U.S. children and performance about 6 percent below U.S. children.
Duration: June 1961-January 1965.
Investigator(s): Rev. Arthur J. Malin (Ph.D. Candidate), Director of Guidance, St. Francis de Sales College, Kamptee Rd., Nagpur, India.

18-G-6 DEFINITION OF CURIOSITY

Purpose: Exploratory study designed to seek a better definition of curiosity of elementary school children than the one currently used.
Subjects: Children in grade 5 attending public schools in New Castle County; and divided into groups of high and low curiosity.
Methods: Factor analysis using Eysenck approach.
Duration: June 1964-May 1965.
Investigator(s): Wallace H. Maw, Ed.D., Associate Professor of Education, University of Delaware, Newark, Del.
Cooperating group(s): U. S. Department of Health, Education, and Welfare.
Publication: Final results to be published in educational and psychological journals.

18-G-7 AN EXPERIMENTAL STUDY OF A METHOD FOR DEVELOPING CREATIVE THINKING ABILITY IN FIFTH GRADE CHILDREN

Purpose: To determine if teachers can foster creativity in their pupils when given training in applying certain principles; to determine the feasibility of using mobile television equipment and audio-video tapes in larger studies similar to present one.
Subjects: 102 fifth grade students from four schools and their teachers. Two teachers and their students served as experimental group; two teachers and their pupils served as controls.
Methods: Two television cameras and microphones were placed in experimental classrooms and tapes were made of classes during day. These were later observed by teacher and investigator to note instances in which principles thought to foster creativity were used. Teacher training conferences were held, based on content of tapes. Pre- and post-tests were administered to pupils and teachers.
Duration: February-August 1964.
Investigator(s): Paul D. Enochs, Ph.D. Candidate, Department of Educational Psychology, University of Missouri, Columbia, Mo.
Publication: Doctoral dissertation, University of Missouri.

18-G-8 TEACHING STRATEGIES AND COGNITIVE FUNCTIONING IN ELEMENTARY SCHOOL CHILDREN

Purpose: To test the hypothesis that if curriculum and teaching strategies emphasize the development of cognitive skills, sophistication in thinking will be produced earlier and for more types of students than is indicated by studies of development of thinking. Specifically, to examine systematically the development of thinking under differing lengths of exposure to the cognition-oriented curriculum especially designed for teaching strategies. To redevelop and refine the three criterion measures: two tests on thinking (inference and application of principles) and a method of classifying classroom transactions on three cognitive tasks (grouping and classifying, drawing inferences from interpreting data, and applying principles in explaining new phenomena or predicting consequences from described conditions).
Methods: Independent analyses of effects of exposure to curriculum, to teaching strategies, and of teacher training. Attempt will be made to adapt for testing purposes a teaching machine with facilities for audiovisual presentation of situations and for recording the steps used in reaching answers. An effort will also be made to develop a system of classifying classroom transactions.
Duration: February 1964-January 1966.
Investigator(s): Hilda Taba, Ph.D., Professor of Education, and Samuel Levine, Ph.D., Associate Professor of Education, San Francisco State College, San Francisco, Calif.

Cooperating group(s): Cooperative Research Branch, Office of Education, U. S. Department of Health, Education, and Welfare.

18-G-9 YOUNG CHILDREN'S THINKING: UNDERSTANDING OF THE PRINCIPLE OF "CONSERVATION"

Purpose: To explore the educational significance of the principle of "conservation," using methods derived from the work of Piaget.
Subjects: 335 children, 5, 6, and 7 years old, drawn from kindergarten and grades 1 and 2 in New York City schools located in differing socio-economic neighborhoods.
Methods: Interviews with individual children; kindergarten children re-interviewed at six-month intervals over a three-year period.
Duration: September 1961-January 1965.
Investigator(s): Millie Almy, Ph.D., Research Associate, Horace Mann-Lincoln Institute of School Experimentation, Teachers College, Columbia University, New York, N. Y., and Edward Chittenden, Ph.D., Mount Holyoke College, South Hadley, Mass.
Publication: Monograph, Teachers College Bureau of Publications.

18-G-10 THE ACCURACY OF CHILDREN'S JUDGMENTS OF THE PLAYING ABILITIES OF THEIR PEERS IN GRADES ONE THROUGH SIX

Subjects: 289 children enrolled in grades 1 through 6 in the Thomas Metcalf Laboratory School of Illinois State University, the first semester of the school year 1962-63.
Methods: Relationships of objective scores on tests of three basic skills (running, throwing, and jumping) with children's judgments of the same skills, and with choices of teammates based on skill, were measured. An extension of this involved measuring the relationships of choices of friends based on a class, social, or work situation with the choices of teammates based on skill, in order to discover the influences of friendship choices on teammate choices. Moreno-type functional choice sociometric questionnaires were employed to obtain the above information.
Findings: Judgments of children regarding the qualities of playing ability of their peers were found to be reliable at all grade levels. Judgments of the throw and jump were significantly accurate as early as second grade, of the run at third grade. There was no one grade level where the judgment of playing skill became accurate, as there was variability in the grade level at which judgments were statistically significant for each skill measured. There was evidence that in choosing teammates based on skills, the children at all grade levels made significantly accurate judgments in relation to the objective skill measures. There was no statistically significant relationship between choices of friends and choice of teammates.
Duration: November 1962-June 1963.
Investigator(s): Evelyn L. Schurr, Ph.D., Assistant Professor of Health and Physical Education, Illinois State University, Normal, Ill. (Reported by Paul Dohrmann, Ph.D., Assistant Professor of Health and Physical Education, Illinois State University.)
Publication: University Microfilms.

18-G-11 VARIABLES AFFECTING GUESSING BEHAVIOR IN CHILDREN

Purpose: To study the effect of redundant information upon hypothesis formation in normal and retarded children.
Subjects: Normals, retarded noninstitutionalized, and retarded institutionalized children.

Methods: Manipulation of amount of information available to assess child's degree in guessing behavior (hypothesis formation).
Duration: October 1963-September 1964.
Investigator(s): Allan G. Barclay, Ph.D., Chief Psychologist, Department of Pediatrics, Cardinal Glennon Memorial Hospital for Children, St. Louis University, St. Louis, Mo.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted to Child Development and Journal of Experimental Psychology.

18-G-12 FACTORS AFFECTING INDUCTIVE REASONING

Purpose: (1) To investigate the ability of children of various ages to form concepts on the basis of different types of sequences of instances; and (2) to investigate the effects of problem complexity on strategies used in solving inductive reasoning problems.
Methods: An attempt will be made to establish whether dependence on type of sequence presented is more marked with younger than with older children, and then, to determine extent to which training could overcome such difficulties in concept formation. An initial attempt will be made to locate aspects of problem complexity having important effects on strategies, and then, to explore these in some detail.
Duration: 1962-1965.
Investigator(s): Janellen Huttenlocher, Ph.D., Center for Cognitive Studies, Harvard University, Cambridge 38, Mass.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-G-13 CHOICE OF GOAL-OBJECT IN RELATION TO CHILD'S ABILITY TO SOLVE PROBLEMS REQUIRING USE OF THE PRINCIPLE OF TRANSITIVE INFERENCE

Purpose: To test the hypothesis that a child's ability to make transitive inferences generalizes over problems in which the goal-object and/or the perceptual elements of the problem vary.
Subjects: 24 boys and 24 girls of modal intelligence, grades 2, 3, and 4 of the P. K. Yonge Laboratory School, University of Florida.
Methods: Each subject was presented with problems in ordinal ranking and deductive reasoning. Solution of all problems required use of transitive relationships. Intra-individual differences in pattern of correct and incorrect solutions were analyzed to see if some goal objects and perceptual elements were significantly and consistently more difficult than others. Both parametric and nonparametric tests of significance were used.
Findings: (1) Problems of both a ranking and reasoning nature were significantly more difficult when goal-object concerned psychological rather than physical relationships; (2) reasoning problems were significantly more difficult than ranking problems, no matter what the goal-object; and (3) perceptual variation in the elements of a problem do not significantly affect the difficulty of the problem.
Duration: April-August 1964.
Investigator(s): James F. Doyle, M.A., and Ira J. Gordon, Ed.D., Professor of Education, University of Florida, Gainesville, Fla.
Publication: To be submitted to Child Development.

18-G-14 PROBLEM-SOLVING BEHAVIOR IN CHILDREN

Purpose: (1) To develop methods that are coordinated with a S-R pretheoretical model which extends learning principles to encompass problem solving; (2) to apply those methods to children of different ages and to different species in order to observe changes that occur with ontogenetic and phylogenetic development; and (3) to determine by experimental manipulation the variables that influence this development.
Subjects: Children, 4 to 10 years of age.
Methods: Simple concept utilization task and inferential reasoning problems.
Findings: A mediational mechanism develops with increasing mental age that reverses the tendency, apparent in animals and children below 6, to execute a nonreversal shift more rapidly than a reversal shift. This development seems to be related to the use of language, as indicated by both developmental and experimental data.
Duration: August 1963-August 1966.
Investigator(s): Howard H. Kendler, Ph.D., Professor of Psychology, and Tracy S. Kendler, Ph.D., Research Psychologist, University of California, Santa Barbara, Calif.
Publication: Psychological Review, 69:1-16, 1962; American Journal of Psychology, 75:571-586, 1962; and others.

18-G-15 PROBLEM-SOLVING CAPABILITIES AND TENDENCIES OF SECOND GRADE CHILDREN

Purpose: To ascertain the diversity of thinking and methods of attack used by second grade children in solving selected word problems.
Subjects: 20 second grade children--10 boys and 10 girls, median age 93 months, mean I.Q. 112, and of predominantly low socio-economic status.
Methods: 10 verbal problems, involving both new and familiar concepts were individually administered to each child in random order in an interview situation. Materials available for use by pupils included single counters, counters in groups of 10, pencils, and paper. Problems were read aloud by interviewer, and child was asked to solve problem in any way he could, using aids if necessary. Child was encouraged to think aloud; notes were kept on visible methods of attack, and if answer was given orally, child was asked to explain method of solution. Information was kept on an open checklist and later analyzed for similar and diversified methods.
Findings: There were no generally consistent methods nor application of facts.
Duration: Spring 1963-spring 1964.
Investigator(s): Elisabeth Armstrong, M.S., Elementary School Teacher, and Harold H. Lerch, Ed.D., Assistant Professor of Education and Mathematics, Southern Illinois University, Carbondale, Ill. (Reported by Robert Karlin, Professor of Education and Director, Reading Center, Southern Illinois University.)
Publication: To be submitted to a professional education journal.

18-G-16 PROBLEM-SOLVING TECHNIQUES OF CHILDREN IN GRADES FOUR THROUGH NINE

Purpose: Cognitive process study to determine amenability of children's skills to change through teaching techniques, transfer of problem-solving skills to academic area, and differences between good and poor problem solvers.
Subjects: 480 students; of the 80 in each grade, 40 are able problem solvers, 40 are poor.
Duration: June 1964-August 1965.
Investigator(s): M. Ray Loree, Ph.D., Professor of Educational Psychology, and Kenneth M. Parsley, Jr., Ph.D., Associate Professor of Educational Psychology, University of Alabama, University, Ala.
Cooperating group(s): Tuscaloosa City and County Schools; Cooperative Research

Branch, Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: To be published in professional journals.

18-G-17 RIGIDITY IN CHILDREN'S PROBLEM SOLVING WITH ESPECIAL ATTENTION TO THE EINSTELLUNG PHENOMENON

Purpose: To identify some correlates of Einstellung Rigidity in children.
Subjects: Approximately 500 children, 5 through 12 years old.
Methods: A water jar test, alphabet maze, and perceptual test were administered under standard, speed, and stress conditions to both experimental and control subjects. In addition, water jar test was given to a small group with actual water and water containers. Results were analyzed in terms of age, sex, and I.Q.
Findings: There were nonsignificant trends for males, older, and brighter children to be less susceptible to set than females, younger children, and those of low intelligence. Although in most cases trend was in predicted direction, there was no significant difference between males and females in ability to overcome set. Hypothesis of a direct relationship between intelligence and ability to overcome set was cautiously accepted. Ambiguous results were obtained for age relationships in ability to overcome set, although most distributions were in predicted direction. A significant direct relationship was found between number of critical problems solved by direct method and ability to overcome set. Stress, as induced by the nine-dot problem, generally led to significantly more rigid behavior than did standard test administration. Speed scores were not significantly different from standard scores. Use of actual water containers did not lead to significantly less rigid behavior than did paper-and-pencil water jar test, although scores were in that direction.
Duration: June 1963-September 1964.
Investigator(s): John D. Cunningham, Ed.D., Science Curriculum Improvement Study, University of California, Berkeley 4, Calif.
Publication: To be published in journals.

Social behavior

18-H-1 THE EFFECTIVE COMMUNITY OF THE ADOLESCENT

Purpose: To map and describe in detail the effective community for all male adolescents in a single geographic area, "effective community" referring to that complex of persons and settings with which a given individual is in effective contact. To analyze associational networks with attention to implications for socialization and adult role development. To develop a methodology for studying community associational patterns in any population so that a body of comparable data on differing communities can be built up. General hypothesis is that range of settings and persons making up community of first-hand experience differs significantly for adolescents differing in important social characteristics such as age, social status, school standing, and relation to legal norms.
Subjects: All male adolescents, 14 to 19 years old, living in an all Negro, largely lower-class area near Washington, D. C.
Methods: Individuals' community networks are identified through collection of "itineraries" from all subjects for a seven-day time sample. Common patterns of association are identified by factor analysis of itinerary data. Data on inhabitants, characteristic behavior patterns, roles, and role incumbents in behavior settings composing community networks or "ego-communities" are collected through observation and interview. Most data collection is carried out by staff of indigenous adolescents serving as research assistants, in whom

"team spirit" and interest are built and nurtured through "detached work" techniques and by fostering a sense of group identity and prestige.
Duration: 1963-not reported.
Investigator(s): Derek V. Roemer (Ph.D. Candidate), Adolescent Process Section, Mental Health Study Center, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, 2340 University Blvd., East, Adelphi, Md.

18-H-2 EAU CLAIRE COUNTY YOUTH STUDY - PHASE II

Purpose: To carry out further analyses of home background, family interaction, and psychological assessments for children who were nominated by their teachers as consistently displaying socially approved or disapproved behavior, and who were studied previously in a project completed in May 1964 (Bulletin 14, Research Relating to Children).
Subjects: A total of 384 children divided equally by sex, behavior according to teacher nominations, grade level (3, 6, or 9), and home location (urban or rural).
Methods: Subjects and their parents were studied intensively by trained interviewers who administered psychological tests, conducted family interviews, and rated family members on Glueck and other scales.
Findings: Significant differentiations on home and family variables, I.Q., school achievement, health, police records, and on some psychological tests have been found.
Duration: May 1964-April 1965.
Investigator(s): John R. Thurston, Ph.D., Associate Professor of Psychology, Wisconsin State College, Eau Claire, Wis., and John F. Feldhusen, Ph.D., Associate Professor of Psychology, Purdue University, Lafayette, Ind.
Cooperating group(s): Division for Children and Youth, Wisconsin State Department of Public Welfare; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Papers presented at American Psychological Association, American Educational Research Association and other meetings; several publications are planned during 1964.

18-H-3 PSYCHOSOCIAL STUDY OF RURAL ADOLESCENTS

Purpose: To carry out second phase of a broad psychosocial study of adolescent behavior problems in rural and small urban communities, exploiting presently available data gathered concurrently with data necessary for a more limited sociological study of rural delinquency; to further develop a new group Rorschach technique administered to 1,050 rural and small city high school students.
Methods: Analysis of psychological test scores, school grades, I.Q.'s, and information concerning adolescent goals, norms, gratifications, frustrations, and overt behavior patterns in school, family, peer, and courtship roles, gathered in interviews, questionnaires, and field observation reports.
Duration: February 1963-August 1964.
Investigator(s): Jerome Himelhoch, Ph.D., Professor of Sociology, Goddard College, Plainfield, Vt.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-H-4 ADOLESCENT BEHAVIOR AND INTERESTS

Purpose: To measure orientations of adolescents toward either the adolescent or adult cultures.

Subjects: 268 boys and 210 girls from 26 public high schools throughout the country.
Methods: Questionnaire administered to subjects.
Findings: Most adolescents had consistent value orientations; the two orientations were uncorrelated rather than inversely related.
Duration: January 1963-September 1964.
Investigator(s): Milton H. Maier, Ph.D., Research Psychologist, and Scarvia B. Anderson, Ph.D., Assistant Director, Cooperative Test Division, Educational Testing Service, Princeton, N. J.
Cooperating group(s): College Entrance Examination Board; Office of Naval Research, Department of the Navy, U. S. Department of Defense.
Publication: A report will be issued as an Educational Testing Service Research Bulletin and will also appear in the professional literature.

18-H-5 THE SOCIAL SYSTEMS OF NEGRO AND WHITE ADOLESCENTS IN SEGREGATED AND INTERRACIAL HIGH SCHOOLS

Purpose: To study racial composition as a variable in the emergence of youth social systems.
Subjects: National sample of 30,000 high school seniors.
Methods: Paper and pencil survey questionnaire.
Duration: May 1964-September 1968.
Investigator(s): David Gottlieb, Ph.D., Associate Professor of Sociology, Michigan State University, East Lansing, Mich.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

18-H-6 DETERMINANTS OF RESPONSIVENESS TO SOCIAL STIMULI

Purpose: To relate parent child-rearing practices and teachers' ratings of social behaviors to laboratory measures of a child's responsiveness to social stimuli; also, to relate a child's autonomic arousal to his responsiveness to social stimuli and to his gross rate of motor output.
Subjects: Children, 4 to 10 years of age; social agents range from parents, peers, teachers, to neutral adults.
Methods: Social reinforcers are used in an operant conditioning situation to shape preference behaviors in a simple motor task. Laboratory tasks have also been constructed providing three situations in which child can imitate behavior of a model. Behaviors being manipulated in imitation tasks range from problem solving abilities (Porteus mazes), to rate of motor behaviors and preference for objects.
Findings: A child's responsiveness to social reinforcers is related to his responses in an imitation situation; the child's responsiveness to social reinforcers is related to the kind of child-rearing practices found in the home. The more responsive a child is to social reinforcers, the better adjusted his teacher and parents describe him. Mothers tend to be more "imitated" than do fathers for young boys.
Duration: 1963-1965.
Investigator(s): Gerald R. Patterson, Ph.D., Associate Professor of Psychology, and Richard Littman, Ph.D., Chairman, Department of Psychology, University of Oregon, Eugene, Oreg.
Publication: To be submitted for publication, December 1964.

18-H-7 AN EXPERIMENTAL ANALYSIS OF SOCIAL MOTIVATION

Purpose: To analyze and demonstrate effects of social reinforcement contin-

gencies involving teachers' attention on behavior of nursery school children; to effect permanent improvement in the children's behavior.
Subjects: Normal nursery school children, approximately 3 to 5 years of age, enrolled in University of Washington Laboratory Preschool.
Methods: Observational techniques; experimental manipulation of teachers' behavior in attending to or ignoring selected aspects of the child's behavior; objective scoring of behavior of teacher and child and of behavior change over period of time.
Findings: Teacher's attention frequently functions as a positive reinforcer, strengthening behaviors. Many undesirable kinds of behavior in preschool children can be extinguished by consistent nondelivery of attention when they occur.
Duration: September 1962-June 1968.
Investigator(s): Donald M. Baer, Ph.D., Associate Professor of Psychology, University of Washington, Seattle 5, Wash.

18-H-8 THE EFFECTIVENESS OF PEERS AS AGENTS OF SOCIAL REINFORCEMENT

Purpose: To isolate factors enhancing a child's effectiveness as a dispenser of social reinforcement for other children.
Subjects: Preschool and elementary school children.
Methods: Assessment of sociometric status of subjects and reinforcing agents by means of standard techniques; teacher ratings of aggression anxiety; observation and recording of response rate data in a simple, socially reinforced task when approval is delivered by a peer, and observation and recording of tangential dependent and hostile behavior.
Findings: Performance is better maintained when peer reinforcing agent is a disliked or unpopular peer than when the reinforcing agent is liked or popular. Children anxious about aggressive behavior of their peers perform better than children who are nonanxious about this form of interpersonal behavior. Perception of reinforcing agent as aggressive or nonaggressive, however, does not effect changes in response rates.
Duration: September 1963-September 1964.
Investigator(s): Willard W. Hartup, Ed.D., Associate Professor, Institute of Child Development, University of Minnesota, Minneapolis 14, Minn.
Publication: To be submitted to professional journals.

18-H-9 COMPARATIVE STUDY OF SANCTIONS ON PREMARITAL SEXUAL BEHAVIOR IN ADOLESCENCE

Purpose: To determine factors which affect permissive and nonpermissive behavior in the sexual sphere.
Methods: Data were drawn on 120 cultures controlled for geographical distribution from Human Relations Area Files. Cross-cultural methodology was employed as outlined by John W. M. Whiting in *Handbook of Social Psychology*.
Findings: Tentative findings to date: (1) permissiveness is significantly related to small tribes, matrilineal descent, matrilocal residence, and segregation of adolescents by sex at puberty; and (2) nonpermissiveness is related to large groups, complex social organization, patrilineality, and achieved rather than ascribed statuses.
Duration: Summer 1962-indefinite.
Investigator(s): George W. Goethals, Ed.D., Lecturer on Social Relations, and John W. M. Whiting, Ph.D., Professor of Social Anthropology, Harvard University, Cambridge 38, Mass.
Cooperating group(s): Milton Fund, Harvard University; Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be published as a monograph or an article, probably in *Journal of Social Psychology*.

18-H-10 SURVEY OF DRINKING PRACTICES AND ATTITUDES OF TEENAGERS

Purpose: To gather data on teenagers' drinking practices and attitudes toward drinking.
Subjects: 9000 students, grades 7 through 12.
Methods: Questionnaire.
Duration: January 1964-January 1966.
Investigator(s): Edward Blacker, Ph.D., Director, Division of Alcoholism, Massachusetts Department of Public Health; Harold Demone, Jr. (Ph.D. Candidate), Director, Medical Foundation, Boston, Mass., and Howard Freeman, Ph.D., Associate Professor, Florence Heller Graduate School for Advanced Studies in Social Welfare, Brandeis University, Waltham, Mass.
Cooperating group(s): Boston University Law Medicine Institute; Division of Alcoholism, Massachusetts Department of Public Health; national medical foundations.
Publication: To be published as a book and/or articles.

18-H-11 EXTINCTION OF THE CIGARETTE SMOKING HABIT IN ADOLESCENTS

Purpose: To evaluate the efficacy of a lecture series to aid in breaking smoking habit.
Subjects: Approximately 140 subjects and controls from 3 public and 1 parochial high schools.
Methods: Five weekly lectures and group discussions in each school, with follow-up planned for three months, six months, and one year.
Duration: March 1964-June 1965.
Investigator(s): Dan C. Overlade, Ph.D., Director, Escambia County Guidance Clinic, Inc., P.O. Box 1869, Pensacola, Fla.
Publication: To be submitted for journal publication.

18-H-12 GROUP ADVISOR BEHAVIOR, GROUP LEADERSHIP STYLE, AND RATING OF LEAST PREFERRED CO-WORKER

Purpose: To determine effectiveness of group process in relation to type of group leadership assigned in achievement of agency and group goals.
Subjects: 10 clubs made up of junior high school boys and girls, ages 12 to 14 years.
Methods: Use of observers, LPC tests, and Bales Interaction Process Analysis Scores.
Duration: September 1963-July 1964.
Investigator(s): Thurlow R. Wilson, Ph.D., Department of Psychology, and Jack Rubenstein, M.S.W., School of Social Work, University of Pittsburgh, Pittsburgh, Pa. (Reported by Dr. Arnold J. Auerbach, Executive Director, YM and WHA-IKC, 315 S. Bellefield Ave., Pittsburgh 13, Pa.)
Cooperating group(s): Pittsburgh Foundation.

PERSONALITY AND ADJUSTMENT

Assessment of personality

18-J-1 DEVELOPMENT OF PICTORIAL SEMANTIC SCALES

Purpose: To determine whether pictorial versions of semantic scales can be used reliably by children; to determine whether ratings by children on these scales relate consistently to other indices of meaning; specifically, whether pictorial ratings of concepts referring to behavioral acts bear any relationship to performance of acts referred to.
Subjects: 60 third grade children, and 55 first grade children. It is proposed scales be tried with mentally retarded and emotionally disturbed subjects.
Methods: Thus far, subjects have been administered 10 pictorial scales, each consisting of a series of five cartoon-like drawings varying sequentially in some attribute (e.g., one scale consists of boy's face which ranges in expression from forlorn frown through neutral point to a broad grin). Subject is asked which panel on scale fits best with concept in question. Concepts tried thus far include two sex-typed activities, two sex role labels, and one classroom behavior ("ask the teacher for help").
Findings: Third grade subjects made significantly different associations to male and female activities and to sex role labels on majority of scales. Four scales, when used to rate "asking the teacher for help," differentiated those children rated by teacher as actually high and low on help-seeking. First graders were less reliable on test-retest but showed same pattern of results.
Duration: Spring 1961-indefinite.
Investigator(s): Malcolm M. Helper, Ph.D., Associate Professor of Medical Psychology, College of Medicine, University of Nebraska, Omaha, Nebr.
Cooperating group(s): Foundations Fund for Research in Psychiatry.
Publication: To be submitted to Child Development.

18-J-2 INKBLOT PERCEPTION AND PERSONALITY

Purpose: Major emphasis will be given to second year of a six-year longitudinal study of developmental aspects of perception, personality, and related cognitive functioning in children. An overlapping design has been employed to study a twelve-year developmental span in only six calendar years. In addition, research will continue on validation and refinement of Holtzman Inkblot Technique.
Subjects: 420 children from 3 different grade levels, 3 years apart.
Methods: Data on HIT, as well as a number of cognitive, perceptual, and personality tests, have been obtained during first year on groups of first, fourth, and seventh grade children. Repeated measurements will be made each year, with specific content of test batteries varying from year to year except for a small continuing core.
Duration: Not reported-1969.
Investigator(s): Wayne H. Holtzman, Ph.D., Professor of Psychology, and Joseph S. Thorpe, Ph.D., Assistant Professor of Psychology, University of Texas, Austin 12, Tex.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-J-3 COMPARISON OF RORSCHACH RESPONSES OF SEVERAL GROUPS OF FIVE TO TEN YEAR OLDS

Subjects: Three groups of white, 5 to 10 year old children from different socio-economic and intellectual levels: (1) New Haven group - 50 boys and 50 girls at each age level of 5 through 10 years, mean I.Q. 118, parents in groups I and II on Minnesota Scale; (2) Weston group - approximately 25 subjects at ages 5, 5 1/2, 6, 7, 8, 9, and 10, mean I.Q. 111, mostly from professional and semiprofessional families; and (3) North Haven group - 50 boys and 50 girls at each age level 5, 5 1/2, 6, 7, 8, 9, and 10, mean I.Q. 107, most parents from levels II and III on Minnesota Scale.
Methods: Rorschachs given, scored, norms determined for all scoring variables.
Findings: For the most part, subjects with higher I.Q's and of higher SES gave "better" Rorschach responses, i.e., higher R, lower W and F percent, higher F+ percent, etc.
Investigator(s): Louise Bates Ames, Ph.D., Director of Research, Gesell Institute of Child Development, New Haven, Conn.
Cooperating group(s): Fund for the Advancement of Education, Ford Foundation.
Publication: Publication as a Genetic Psychology monograph is anticipated.

18-J-4 CHILDREN'S DRAWINGS AS INDICATORS OF SEXUAL DISCRIMINATION

Purpose: Poor performance on children's drawing tests may be to a great extent a function of the broader problem of an inability or severe limitation in depicting a well developed human figure. This study will: (1) test the assumption that drawings can give accurate assessments of a child's sexual identification; (2) determine whether sexual discrimination in drawings is a function of chronological age and maturational level; and (3) examine drawings as a response measure.
Subjects: 70 boys, aged 5.5 to 7.5 years, of average or superior intelligence. Subjects attend the Ethical Culture Schools, and come from middle and upper middle class backgrounds with high cultural standards.
Methods: Two initial measures of visual-motor skill and ability to do representational drawings are used. One task involves drawings of two transportation objects; the other involves standard "draw-a-person" and "person of opposite sex". DAP pair will indicate general ability to draw human figure and also will serve as an initial measure of sexual discrimination in drawings. Stories in which masculinity will either be reinforced or attacked will then be read to subjects, who will be asked to draw principal male and female characters in each story and to verbally express their awareness of story's point. Experienced judges will be employed to rate all of the drawings and verbal material obtained.
Duration: 1958-1964.
Investigator(s): Leah Levinger (Ph.D. Candidate, New York University), Guidance Coordinator and Chief Psychologist, Ethical Culture Schools, 33 Central Park West, New York, N. Y.
Publication: Will probably be submitted for journal publication.

18-J-5 COMPARISON OF BEHAVIOR JOURNALS AND GRAPHOANALYSIS

Purpose: To compare the characteristics of behavior found in child study records and analysis of children's handwriting.
Methods: 200 child study records are compiled by various teachers over a period of four and one half months. Three samples of each child's handwriting are analyzed by a certified graphoanalyst. The summary of the child study record, including patterns and classification of incidents is compared by researcher to the handwriting analysis.
Findings: There is an amazing consistency between an analysis of handwriting and child study summary statements. Since handwriting analysis can be a more

rapid process than child study, and yet produce at least some of the same results and conclusions, it is reasonable that there is the possibility of the techniques being used either together or independently to assist teachers.
Duration: February 1964-January 1966.
Investigator(s): Lewis R. Fisher, D.Ed., Professor of Education, Texas College of Arts and Industries, Kingsville, and Ruth E. Fisher, M.S., Teacher, Bishop Public Schools, Bishop, Tex.
Cooperating group(s): State of Texas.
Publication: Articles to be submitted to periodicals.

Processes and factors in personality

18-K-1 A STUDY OF EGO DEVELOPMENT FROM BIRTH

Purpose: To investigate the mechanisms of ego formation which arise from inherent apparatuses of primary autonomy spoken of by Hartmann and Rapaport and those ego structures which emerge out of psychic conflict.
Subjects: Follow-up of infants already studied intensively in infancy plus new subjects to be studied more intensively with regard to variables suggested.
Methods: Direct observation of ongoing development, mother-infant interaction, response to standard stimulation, changes in state, capacity to maintain state of alert inactivity, and constitutional differences in reflex behavior. Mother-infant interaction will be analyzed in terms of average expectable caring practices, and spontaneous stimulation. Comparison will be made with respect to specific responses in controlled interaction situations.
Duration: May 1963-indefinite.
Investigator(s): Justin D. Call, M.D., Associate Professor of Psychiatry, Alfred Goldberg, M.D., Assistant Research Psychiatrist, and Marianne Marshack, Ph.D., Research Psychologist, School of Medicine, University of California, Los Angeles 24, Calif.
Cooperating group(s): Los Angeles Institute for Psychoanalysis.
Publication: Material to be published as available and appropriate at various stages during study.

18-K-2 STUDIES OF EGO DEVELOPMENT

Purpose: To study systematically the rate and pattern of specific components of ego development; to relate individual differences to interaction effects among specified intrinsic and extrinsic variables.
Subjects: Cross-sectional sample consists of approximately 400 infants up to 24 months of age, used for validation of scales and assessment procedures; longitudinal sample includes 16 infants from birth to 2 years of age.
Methods: Periodic measurements and assessment of infant development scales (Guttman type) dealing with precursors of cognition, communication, imitation and similar dimensions; periodic assessment of patterns, mother-child interaction, and infant behavior in life situations, supplemented by clinical descriptive study using interviews, observations, and photography of children and families.
Duration: September 1964-August 1971.
Investigator(s): Sibylle K. Escalona, Ph.D., Professor of Psychology, and Harvey H. Corman, M.D., Associate Clinical Professor of Psychiatry, Department of Psychiatry, Albert Einstein College of Medicine, Yeshiva University, New York 61, N. Y.

18-K-3 STUDIES IN EGO DEVELOPMENT: THOUGHT AND MOTILITY

Purpose: To study early stages in development of interests, defenses, and adaptive failures, particularly in relationship to general cognitive and motor behavior patterns of the child.
Subjects: 15 4-year old boys and 15 8-year old boys and their mothers; additional groups to be seen.
Methods: Variety of specially designed assessment techniques including ability tests, problem solving tasks, playroom observations, stress situations, and interviews.
Duration: September 1962-indefinite.
Investigator(s): Fred Pine, Ph.D., Associate Professor, Psychology Laboratory, Department of Psychiatry, Downstate Medical Center, State University of New York, 450 Clarkson Ave., Brooklyn 3, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-K-4 ROLE OF NEONATAL CHARACTERISTICS IN LATER DEVELOPMENT

Purpose: To study antecedents of a variety of ego functions and defenses. (See also pilot project reported in Bulletin 16, Research Relating to Children.)
Subjects: 40 normal neonates, full-term, normally delivered.
Methods: Observations and sensory stimulation experiments designed to yield information on nine neonatal variables, all of which involve response to internal and external stimuli.
Duration: May 1964-May 1967.
Investigator(s): Anneliese F. Korner, Ph.D., Research Associate, Department of Psychiatry, Stanford University School of Medicine, Palo Alto, Calif.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Paper on preliminary work leading to this study now in press as part of Psychoanalytic Study of the Child.

18-K-5 INDICATORS OF DEVELOPMENTAL CHANGE IN LOWER CLASS CHILDREN

Purpose: To develop theory-relevant personality measures appropriate for lower class children of junior high school age in order to investigate personality development with special reference to the school.
Subjects: Total enrollment (N=360) in a junior high school in a culturally deprived area.
Methods: Personality measures (sentence completion, objective questionnaires, etc.) used to classify students, 180 of whom were placed into classroom groups homogeneous in personality stage.
Findings: Thus far, stage-similar classroom grouping appears to have educational relevance.
Duration: July 1962-June 1965.
Investigator(s): David E. Hunt, Ph.D., Associate Professor of Psychology, Syracuse University, Syracuse, N. Y.
Cooperating group(s): Ford Foundation; Office of Education, U. S. Department of Health, Education, and Welfare.

18-K-6 PERSONALITY DEVELOPMENT OF ADOPTED CHILDREN DURING MIDDLE CHILDHOOD AND EARLY ADOLESCENCE

Purpose: To identify factors in the life history of adopted children which differentiate between healthy personality development and personality disturb-

ance. Major questions center around development of identity and the self-concept, the role of identification in development of impulse control, and long-term implications for personality development of maternal separation during infancy.
Subjects: 75 children studied at 8 and 10 years of age.
Duration: January 1964-indefinite.
Investigator(s): Leon J. Yarrow, Ph.D., Director, and Marion S. Goodwin, M.A., Assistant Director, Adoption Research Project, Family and Child Services, 929 L St., N. W., Washington 1, D. C.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-K-7 THE DEVELOPMENT OF ANXIETY IN BABIES AND YOUNG CHILDREN

Purpose: To study, by investigational and behavioral methods, those factors which appear to be responsible for the development of anxiety.
Subjects: Babies and young children.
Methods: Correlation of basic physiological data with reactions to normal situations and stimuli.
Duration: April 1964-1969.
Investigator(s): Dugal Campbell, Ph.D., Associate Professor of Psychology, and Michael Partington, Ph.D., Associate Professor of Pediatrics, Queen's University, Kingston, Ont.
Cooperating group(s): Provincial mental health grant.
Publication: To be submitted to pediatric and psychological journals.

18-K-8 SELF-PERCEPTION, STUDENT ROLE PERCEPTION, AND ANXIETY

Purpose: To determine the relationship between measures of self-concept and congruence of student role perception with institution, teacher and peers, and measures of anxiety.
Subjects: 225 school children randomly selected from grades four, five, and six.
Methods: A correlational study utilizing the following instruments: (1) Self-Social Symbols tasks; (2) Student-Role Q-Sort; and (3) General Anxiety Scale for Children.
Duration: September 1963-September 1964.
Investigator(s): Howard E. Lamb, Ed.D., Assistant Professor of Education, University of Delaware, Newark, Del.

18-K-9 PHYSIOLOGIC, I.Q. AND ANXIETY MEASURES OF CHILD DENTAL PATIENTS

Purpose: To determine, by means of objective data, reactions of children of various age groups to the dental situation and to modifications of the situation by a simulated dental procedure, an induced pain, and by exposure to audio analgesia.
Methods: (1) Physiologic responses of children four through six years of age will be measured by means of galvanic skin response (GSR), blood flow (BF), and cardiac rate recorder before coming to, and within, the dental treatment situation. How these physiological effects are varied by introduction of additional stimuli such as simulated dental cavity excavation using a finishing bur, and use by the child of an earphone type stereophonic music producing device (Audiac) will be evaluated. These two stimuli will be evaluated individually and together for any interactions. (2) The same physiologic reactions will be measured in children eight through fourteen years of age. Also measured will be physiological reactions caused by application of a reproduci-

ble dental procedure (i.e., electric stimulation to tooth pulp, carried to pain reaction threshold). The effect of introducing four components of audioanalgesia into this painful situation will be observed to see how they influence the physiologic responses. (3) Any relationship will be determined between anxiety levels as determined by Children's Manifest Anxiety Scale, I.Q. as determined by Columbia Mental Maturity Test, and the physiological data obtained above.
Duration: 1962-October 1964.
Investigator(s): Jack W. Howitt, D.D.S., Clinic Supervisor, Eastman Dental Dispensary, 800 East Main St., Rochester, N. Y.
Cooperating group(s): National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Pilot study submitted to Journal of Dentistry for Children.

18-K-10 THE DEVELOPMENT OF SELF AND SOCIAL CONSTRUCTS

Purpose: To investigate the development of the self and social constructs of children, especially the definition of the self in relation to others.
Subjects: 312 elementary school children in grades 1 through 6.
Methods: Children's Self and Social Constructs Test, an Individualism Scale, Power and Evaluative Scales from the Semantic Differential, and a Sociometric Scale were administered in classrooms to 26 boys and 26 girls in each grade from 1 to 6. Effects of grade level and sex on each measure were analyzed and all measures intercorrelated with each other.
Findings: To date, significant effects for sex, grade, and sex by grade have been found in relation to 21 personality measures; further analyses are in process.
Duration: January 1963-January 1964.
Investigator(s): Barbara H. Long, Ph.D., Research Fellow, Robert C. Ziller, Ph.D., Associate Research Professor, Center for Research on Social Behavior, and Edmund H. Henderson, Ph.D., Assistant Professor of Education, University of Delaware, Newark, Del. (Reported by Gorham Lane, Ph.D., Professor of Psychology, University of Delaware.)
Cooperating group(s): Department of the Air Force, U. S. Department of Defense; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Plan to submit to Child Development.

18-K-11 SELF AND SOCIAL CONSTRUCTS AND GEOGRAPHIC MOBILITY

Purpose: To test hypotheses derived from a consideration of the impact of mobility on a self-social constructs theory of personality.
Subjects: 219 eighth grade students of both sexes, 83 of whom have lived all their lives in a single community, while others have moved three or more times.
Methods: Self-Social Symbols Tasks (Ziller, Alexander, and Long, 1964) and a measure of self-other orientation were administered to subjects.
Findings: Children who have moved frequently: (1) perceive the self as more central and as more different; (2) are more other-, rather than self-oriented; (3) are more dependent; and (4) have less interest in self-analysis.
Duration: January-September 1964.
Investigator(s): Robert C. Ziller, Ph.D., Associate Research Professor and Barbara H. Long, Ph.D., Research Fellow, Center for Research on Social Behavior, University of Delaware, Newark, Del. (Reported by G. Gorham Lane, Ph.D., Professor of Psychology, University of Delaware.)
Cooperating group(s): Department of the Air Force, U. S. Department of Defense; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted to Journal of Social Psychology.

18-K-12 SELF AND SOCIAL CONSTRUCTS AND SOCIAL DESIRABILITY

Purpose: To test hypotheses derived from theories of self and social constructs in a field study of popular and nonpopular children.
Subjects: 25 popular and 25 nonpopular children, selected from extremes of a sociometric test given to 6th grade classes.
Methods: The Self-Social Symbols Tasks, largely nonverbal measures of self in relation to others, were illustrated to subjects.
Findings: Significant differences between groups were found in relation to parental identification, complexity of self, centrality of self, power in relation to teacher, self-esteem, and independence.
Duration: September 1963-October 1964.
Investigator(s): Robert C. Ziller, Ph.D., Associate Research Professor, Center for Research on Social Behavior; Barbara H. Long, Ph.D., Research Fellow, University of Delaware, Newark, Del.; and Morea Alexander, M.A., Elementary School Teacher. (Reported by G. Gorham Lane, Ph.D., Professor of Psychology, University of Delaware.)
Cooperating group(s): Department of the Air Force, U. S. Department of Defense; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-K-13 FACTORS AFFECTING THE YOUNG CHILD'S SELF-CONTROL AND CONFORMITY TO ADULT-IMPOSED RESTRICTIONS

Purpose: To investigate antecedents and correlates of self-control and conformity.
Subjects: Preschool children.
Methods: In experimental situation, child (or 2 or 3 children) will be left alone in a room with instructions to play with or use a small supply of toys and materials. Children will have been given instructions that restrict their use of materials, and their adherence to restrictions will be observed through a one-way vision mirror and recorded. Specific variables to be studied are: (1) effects of giving a child reasons and explanations for restrictions imposed on him versus making arbitrary demands; (2) effects of making consequences of misbehavior explicit versus ambiguous; and (3) differential effects of disciplining agents who are supportive and nurturant versus ones who are threatening and punitive. Self-control in the experimental situation will also be related to certain personality characteristics (frustration tolerance and delay of gratification), sociometric status with peers, and parental discipline practices.
Duration: June 1964-March 1965.
Investigator(s): Shirley G. Moore, Ph.D., Associate Professor of Child Psychology, Institute of Child Development, University of Minnesota, Minneapolis, Minn.
Publication: Probably to appear in Child Development.

18-K-14 SIBLING ASSOCIATIONS AND INTERACTIVE RESPONSE SETS

Purpose: The present study is concerned with the operational measurement of interactive response sets originating in subject's association with other persons, in particular, those with his siblings. Stimulus conditions relevant to this inquiry are those resulting from subject's ordinal position and from sex status of subject's siblings. Because of their enduring influence, it is assumed they lead to development of characteristic interactive response sets, which in turn manifest themselves in personality characteristics and a variety of performances (cognitive, vocational, sex role preferences). It is hypothesized that specific classes of social interaction here defined lead to sets which differentiate members of varying ordinal positions and sibling sex status on variables of congruence of self and role perceptions, role taking ability,

BEST COPY AVAILABLE

role clarity and conformance, empathy, and response stereotypy.
Subjects: 120 children in the 8, 2-child family combinations and their parents; 400 adults, 17 to 23 years old.
Methods: Measures involve the Adjective Check List, As-If Test, Stick-Figure Test, and an interview schedule to evaluate presence and effects of hypothesized sets, flexible-diffuse, and stability-stereotypy.
Duration: 1963-1965.
Investigator(s): Benjamin G. Rosenberg, Ph.D., and Brian Sutton-Smith, Ph.D., Associate Professors of Psychology, Bowling Green State University, Bowling Green, Ohio.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-K-15 SEX ROLE IDENTIFICATION IN MALE ADOLESCENTS

Purpose: To assess role identification in father-absent Negro and white adolescents with regard to field dependence as defined by Witkin.
Subjects: Negro and white, male and female adolescents.
Methods: Use of Witkin's Rod and Frame Test, Osgood's Semantic Differential, and Gough's Masculinity Scale to assess masculine role and degree of field dependence.
Findings: Negro father-absent children are more field dependent.
Duration: October 1963-September 1964.
Investigator(s): Allan G. Barclay, Ph.D., Chief Psychologist, Department of Pediatrics, Cardinal Glennon Memorial Hospital for Children, St. Louis University, St. Louis, Mo.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted to *Journal of Social Psychology* and *Journal of Personality*.

18-K-16 IDENTITY IN ADOLESCENTS AND ITS RELATION TO DEVIANCY

Purpose: To study adolescent boys' perceptions of themselves, their views of the perceptions others have of them, and the demands these important others make of them; to relate these perceptions to mental disturbance and delinquent behavior.
Subjects: 60 normal adolescent boys matched by age, socio-economic status, and I.Q. with 30 delinquent and 30 psychotic boys.
Methods: Each subject describes on semantic differential actual self, ideal self, self as perceived by parents, teachers, and friends, and self as parents, teachers, and friends would like subject to be. D^2 relations between these semantic differential profiles will be computed.
Duration: December 1963-December 1964.
Investigator(s): John B. Marks, Ph.D., Director, Mental Health Research Institute, State Department of Institutions, Ft. Steilacoom, Wash., and Irwin G. Sarason, Ph.D., Department of Psychology, University of Wisconsin, Madison 6, Wis.

18-K-17 SOCIALIZATION OF AGGRESSION

Purpose: To test the hypotheses that: (1) positive frustration (i.e., demands) in child-rearing practices leads to negative aggression; and (2) that negative frustration (i.e., inhibitions) leads to positive aggression.
Subjects: Preschool and nursery school children.
Methods: Questionnaire to determine mothers' and fathers' emphases on

encouraging versus discouraging as control techniques, related to children's responses to frustrations in doll play.
Findings: Preliminary analyses indicate some support for hypotheses.
Duration: 1963-1965.
Investigator(s): Jesse E. Gordon, Ph.D., Associate Professor of Psychology, University of Michigan, Ann Arbor, Mich.
Publication: Publication planned for 1965.

18-K-18 HYPNOTIC SUSCEPTIBILITY IN MIDDLE CHILDHOOD: FURTHER STUDIES

Purpose: To describe the relationship of hypnotic susceptibility to age groups, age changes (longitudinally), parent identification patterns of children, and interests/activities of children.
Subjects: 25 to 30 children, 8 to 16 years of age, most of whom participated in an original study two years ago (Bulletin 16, Research Relating to Children).
Methods: Children's Hypnotic Susceptibility Scale; Stanford Hypnotic Susceptibility Scale, Form B; semi-structured child interview on play, interests, fantasy; questionnaire on daydreaming for children; structured interview with mother to ascertain child and parent characteristics and family interaction patterns.
Duration: October 1963-January 1965.
Investigator(s): Rosemarie K. Moore, Ph.D., Research Associate, Laboratory of Human Development, Stanford University, Stanford, Calif.
Publication: To be submitted to professional journals.

18-K-19 SENSE OF HUMOR AS A DIMENSION OF CREATIVITY

Purpose: To determine if there is any correlation between creativity and sense of humor.
Subjects: 127 public elementary school pupils, grades 5 and 6.
Methods: A correlational study between children's scores on the Minnesota Tests of Creative Thinking (Abbreviated Form VII) and scores on an instrument developed by the researcher, involving children's responses to uncaptioned original cartoons, judged for their humor by independent judges.
Duration: September 1963-September 1964.
Investigator(s): Donald R. Ferris, Ed.D., Associate Professor of Elementary Education, Purdue University, Lafayette, Ind.
Cooperating group(s): San Jose State College Foundation.
Publication: To be published in appropriate journals when completed.

18-K-20 PRESCHOOL CHILDREN'S WILLINGNESS TO TRY DIFFICULT TASKS

Purpose: (1) To develop three research instruments for the measurement of preschool children's willingness to try the difficult; (2) to determine whether willingness to try the difficult is a function of ability; and (3) to determine whether willingness to try the difficult is a relatively constant personality characteristic.
Subjects: Children, 3 to 5 years of age.
Methods: Three instruments for measurement of willingness to try the difficult, including: (1) a buttoning task based on fine motor coordination; (2) a puzzles task based on ability to see visual relationships; and (3) a target task based on gross motor coordination. Independent study of each instrument will focus on control of ability, as adequate control of this variable is essential if each child is to be offered choices between the easy and the difficult relative to his own ability. Planned adjustment for ability will be tested for each task by analyzing responses of children representing

three different ability groups. Responses of children to all three tasks will then be compared, and sex and age differences will be studied.
Duration: February 1964-February 1966.
Investigator(s): Elizabeth K. Starkweather, Ph.D., Associate Professor, Department of Family Relations and Child Development, Oklahoma State University of Agriculture and Applied Science, Stillwater, Okla. 74075.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Emotional and personality disturbances

18-L-1 DETECTION OF PATHOLOGY IN PREKINDERGARTEN CHILDREN

Purpose: To determine characteristics and behavior in the four and one-half year old child predictive of emotional disturbance in the school setting.
Subjects: 110 preschool children.
Methods: Behavior and personality characteristic rating scales filled out by mothers at time of children's kindergarten registration.
Duration: 1961-1964.
Investigator(s): Emory L. Cowen, Ph.D., Professor of Psychology, University of Rochester, Rochester 20, N. Y.

18-L-2 EARLY IDENTIFICATION OF THE SOCIALLY AND EMOTIONALLY MALADJUSTED

Purpose: To identify potentially maladjusted children; to set up a preventative program in public schools.
Subjects: Children in grades 1, 2, and 3.
Methods: Teacher observations and completion of a questionnaire.
Duration: October 1962-June 1964.
Investigator(s): Harry B. Fieldston, M.S.W., School Social Worker, Morris County Department of Education, Court House, Morristown, N. J.
Cooperating group(s): New Jersey State Department of Education.
Publication: Information may be obtained through investigator.

18-L-3 FOLLOW-UP STUDY OF MALADJUSTED CHILDREN IDENTIFIED AS NEEDING RESIDENTIAL TREATMENT IN HAWAII

Purpose: To obtain some indication of the degree of personal and social maladjustment of cases identified in a 1955 study (Bulletin 15, Research Relating to Children) as being in need of residential treatment; to determine extent of subject contact with critical psychiatric, correctional, and judicial agents subsequent to time of original study.
Subjects: 84 persons, ages 15 to 27, originally identified in 1955.
Methods: Files of various governmental agencies were checked for record of frequency, duration, and nature of contact. For example, type and number of offenses were obtained from criminal and correctional facilities. Diagnosis and type of services were obtained from psychiatric facilities. Private clinics and psychiatric units attached to general hospitals were also checked for contact.
Findings: Almost half of sample had been nominated for original study by correctional and judicial facilities; the other half were nominated by psychiatric and social facilities. In subsequent contact, more individuals were known to correctional facilities (72 percent) than those who received some kind of psychiatric care. Involvement with the "law" (acting-out behavior)

seems to be a common symptom of seriously disturbed children. While 46 percent of the sample had some psychiatric contact, another 46 percent received no psychiatric services after 1955. For those who received psychiatric care, services were primarily rendered on an outpatient basis of very short duration (63 percent seen seven times or less), and for evaluation in only 58 percent of the cases.
Duration: November 1963-May 1964.
Investigator(s): H. Kelly Naylor, Ph.D., Chief Clinical Psychologist, and Vera Young, M.A., Research Analyst, Mental Health Division, Hawaii State Department of Health, Honolulu, Hawaii.
Publication: Information may be obtained from investigator.

18-L-4 ESSEX CHILD DEVELOPMENT CENTER-GARDEN SCHOOL

Purpose: To study longitudinally the emotionally disturbed child; to evaluate family adequacy in relation to child; and to develop and describe experimental teaching program for emotionally disturbed child with neurological impairment and to describe the new program for preschool child.
Subjects: 20 school age and 4 preschool age day-patients in school setting.
Methods: Multidisciplined evaluation to include sociological, psychological, psychiatric, neurological, and educational appraisals.
Duration: 1960-continuing.
Investigator(s): Gloria Steiner, M.S., Psychologist, Robert Stepney, A.A.P.S.W., Clinical Administrator, and Alvin Friedland, M.D., Medical Director, Essex Child Development Center-Garden School, Franklin Ave., Belleville, N. J. 07109.
Cooperating group(s): Essex County Mental Health Association; Belleville Board of Education; New Jersey Department of Institutions and Agencies.
Publication: Annual special project report to New Jersey Department of Institutions and Agencies.

18-L-5 A FOLLOW-UP STUDY OF PRESCHOOL CHILDREN FROM A THERAPEUTIC NURSERY

Purpose: To study the natural history of early disturbances of psychological functioning.
Subjects: Children who have attended the Child Development Center nursery or Outpatient Therapy department.
Methods: Age-specific scales; symptom checklists; Q-sort.
Duration: 1964-1966.
Investigator(s): Peter B. Neubauer, M.D., Director, Child Development Center, 120 W. 57th St., New York 19, N. Y.

18-L-6 ETIOLOGICAL FACTORS IN CHILD PSYCHOSIS: THE ROLE OF DEVIANT SENSORY EXPERIENCE

Purpose: To explore hypotheses regarding the etiologic role of deviant sensory capacities or functioning in the development of childhood psychosis.
Subjects: All children diagnosed as "childhood psychotic" over a period of three years at Children's Psychiatric Hospital.
Methods: Initially, review is made of selected facets of the reported early developmental history of childhood psychotics, as available in case records. Later, direct interviews with parents of childhood psychotics will be conducted with more specific focus upon child's early sensory development.
Findings: Initial findings suggest relatively small incidence of sensory deviations in these children; but study of a much larger group, with specifically focused parent interviews, and analysis of data in terms of different sub-types of childhood psychoses will provide more conclusive data.
Duration: January 1964-September 1965.

Investigator(s): Albert C. Cain, Ph.D., Children's Psychiatric Hospital, University of Michigan Medical Center, Ann Arbor, Mich.

18-L-7 THE SECOND PHASE OF THE BEHAVIORAL CLASSIFICATION PROJECT

Purpose: To validate the dimensions of children's emotional disorders discovered in the first phase of Behavioral Classification Project (Bulletin 14, Research Relating to Children).
Subjects: First admissions to child guidance clinics in Florida and Louisiana, specified institutional children, and normal controls.
Methods: Administration of Behavioral Classification Project items on punch cards to respondents, primarily mothers of subjects; determination of demographic and personal history variables; factor analysis of correlation matrix of intercorrelations of Behavioral Classification Project and social case items; comparison of resulting factors with those derived from two major trial projects in first phase; setting up hypothesis and procedures for third phase.
Duration: June 1964-August 1965.
Investigator(s): Ralph Mason Dreger, Ph.D., Professor of Psychology, Louisiana State University, Baton Rouge, La.
Cooperating group(s): Florida Council of Mental Health Clinic Directors.
Publication: Journal of Consulting Psychology, 28:1-13, 1964.

18-L-8 VIDEO-TAPE OBSERVATIONS OF DISTURBED YOUNG CHILDREN

Purpose: To devise a play situation for use with disturbed young children which will have the potential of discriminating between diagnostic groupings and which can be recorded on video-tape for future viewing and analysis.
Subjects: 30 children, 3 to 8 years, from following categories: psychotic reactions (schizophrenic and/or autistic); brain-damaged, with or without associated mental retardation; mixed clinical pictures of the above entities; severe speech problems; and mental retardation. Normal subjects, ages 2 to 4 comprise a control group.
Methods: Standardized play interview situation used, designed to elicit specific behavioral reactions such as constructive play, persistence at a task, interaction with adult examiner, reactions to frustration and gratification. Data will be analyzed by means of ratings of specific behavior and by use of a multi-pen event recorder, while viewing tapes, to record duration and frequency of various modes of reaction.
Duration: December 1963-March 1965.
Investigator(s): Mary R. Haworth, Ph.D., Associate Professor of Medical Psychology, and Frank J. Menolascino, M.D., Instructor in Neurology and Psychiatry, College of Medicine, University of Nebraska, Omaha 5, Nebr.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be published.

18-L-9 BEHAVIOR CLASSIFICATION, EARLY LEARNING EXPERIENCE, AND PSYCHO-EDUCATIONAL MANAGEMENT OF EMOTIONALLY DISTURBED CHILDREN

Purpose: To develop a system of behavior classification constructs for emotionally disturbed children having relevance to etiology, treatment, and prognosis.
Subjects: Groups of emotionally disturbed children in schools and hospitals. Children from Project Re-ed (George Peabody College) constitute central group on which project is based.
Methods: Collection of four classes of data: (1) child-rearing practices and

role values of parents; (2) behavior of subjects; (3) treatment approaches used; and (4) child's future level of functioning. Correlation, factor analysis, and discriminant functions will be used in analysis.
Findings: Rating/ranking instrument for child behavior is being developed. Mean test-retest reliability coefficients range from .72 to .97.
Duration: September 1963-1967.
Investigator(s): Rue L. Cromwell, Ph.D., Associate Professor of Psychiatry, Vanderbilt Medical Center, Nashville, Tenn.
Cooperating group(s): Project Re-ed, George Peabody College for Teachers.

18-L-10 DIFFERENTIAL CRITERIA FOR ASSESSMENT OF SERIOUSLY DISTURBED CHILDREN

Purpose: To develop and refine evaluative criteria for use in establishing training goals for seriously disturbed children.
Subjects: Children enrolled during last 8 years in League School For Seriously Disturbed Children.
Methods: Nursery population periodically evaluated; subjects assigned to training groups as part of training program set up by educational therapist. Children evaluated and re-evaluated by psychologist, educational therapist, and language therapist.
Duration: June 1963-August 1964.
Investigator(s): Zelda S. Klapper, Ph.D., Assistant Research Professor of Pediatrics, Albert Einstein College of Medicine, Yeshiva University, New York 61, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-L-11 ENDOGENOUS BIOLOGICAL RHYTHMS IN CHILDREN

Purpose: To distinguish factors of organicity in different types of behavior disorders through frequency analysis of a variety of spontaneous endogenous oscillations.
Subjects: Children with mental retardation, spastic and athetoid types of cerebral palsy, schizophrenia, and normals. Thus far, 100 retardates have been studied.
Methods: A battery of autonomic, metabolic, and perceptual psychologic measures.
Duration: April 1963-March 1965.
Investigator(s): John W. Lovett Doust, M.D., Professor of Psychiatry, University of Toronto, Toronto, Ont.
Cooperating group(s): Ontario Mental Health Foundation; Metro Toronto Association for Retarded Children.

18-L-12 BEHAVIORAL CHARACTERISTICS OF HOSPITALIZED DISTURBED CHILDREN

Purpose: To study the children in five New Jersey Hospitals using the Children's Behavior Inventory developed by Burdock and Hardesty.
Subjects: All disturbed children through age 16, hospitalized in New Jersey's State Mental Hospitals (approximately 500 children).
Methods: The Burdock Children's Behavior Inventory, consisting of 146 behavioral items, age-graded, was filled in by suitable nursing personnel for all children. Children were re-rated by same persons at 3- and 12-month intervals. Reliability studies were made. Background information was obtained for each child from case records.
Duration: January 1963-January 1965.
Investigator(s): Frances E. Cheek, Ph.D., Chief, Experimental Sociology,

Bureau of Research in Neurology and Psychiatry, Box 1000, Princeton, N. J.
Publication: To be published as journal article or articles.

18-L-13 INVESTIGATION OF RELATIONSHIP BETWEEN MATERNAL NEEDS AND ATTITUDES AND PSYCHOPATHOLOGY IN BOYS

Purpose: To determine whether certain types of needs and attitudes in mothers are related to types of symptomatology in their sons.
Subjects: 70 boys, aged 6 to 12, seen as outpatients at Lafayette Clinic, and their mothers.
Methods: PARI, WAIS, MMPI, Edwards Personality Preference Schedule, and a TAT-type test developed for this study were administered to mothers. Boys were given WISC, Rorschach, other parts of a standard battery (e.g., perceptual-motor measures), and the same TAT-type test. Analysis is being done across needs, diagnostic categories of child (psychosis, neurosis, character disorder, etc.), and across cardinal figures (father, mother, peer).
Duration: June 1963-October 1964.
Investigator(s): Jean S. Braun, Ph.D., Chief Psychologist, Children's Service, and Shirley I. Dobie, Ph.D., Chief Psychologist, Outpatient Service, Lafayette Clinic, 951 E. Lafayette St., Detroit, Mich.
Publication: Papers in preparation.

18-L-14 CHILDREN'S REACTIONS TO THE DEATH OF A PARENT

Purpose: To study the impact of loss of a parent on children of different ages.
Subjects: Child and adolescent patients and surviving parents in treatment in an outpatient mental hygiene clinic; nonpatient children and parents.
Methods: Clinical case material is gathered; intensive interviews are conducted. Data are being analyzed particularly in regard to developmental variations in reactions to loss and factors making for pathological sequelae or for mastery of such trauma.
Duration: 1960-indefinite.
Investigator(s): Martha Wolfenstein, Ph.D., Clinical Associate Professor, and Gilbert Kliman, M.D., Clinical Instructor, Department of Psychiatry, Albert Einstein College of Medicine, Yeshiva University, New York 61, N. Y. (Reported by Joseph B. Cramer, M.D., Associate Professor and Director of Child Psychiatry, Albert Einstein College of Medicine.)
Publication: To be published in professional journals and eventually in book form.

18-L-15 FOLLOW-UP STUDY OF MENTALLY ILL AND MENTALLY RETARDED CHILDREN

Purpose: To determine nature of children's social adjustment after being released from a mental hospital, with particular emphasis on family and school adjustment problems.
Subjects: Consecutive cases of 35 mentally ill and 21 mentally retarded children released from two State mental hospitals in California on leave of absence to the Northern Region Bureau of Social Work during April-June 1962.
Methods: Social and psychiatric data collected on child's background, treatment, and outcome after 12 months of leave. After 24 months of leave, an attempt is made to locate all children, interview their significant others, and trace the course of the posthospital adjustment period. A structured interview schedule will be administered by psychiatric social workers and data analyzed on basis of children's major social characteristics. Findings will be analyzed in relation to sociological theory of socialization processes, and attempts will be

made to trace social effects of residual deviancy labeling.
Investigator(s): Dorothy H. Miller, M.A., Psychiatric Social Worker, Social Research Laboratory, California State Department of Mental Hygiene, 3330 Geary Blvd., San Francisco, Calif. 94118.

18-L-16 ACHIEVERS AND NONACHIEVERS AMONG DISTURBED CHILDREN

Purpose: To investigate symptom patterns among achievers and nonachievers.
Subjects: 110 inpatients, 4 to 6 years of age, at Children's Psychiatric Hospital.
Methods: IPL-V, an information processing language handling symbolic data.
Duration: Not reported-August 1964.
Investigator(s): Franz Huber (Ph.D. Candidate), Assistant Director, University Hospital School, Medical Center, University of Michigan, Ann Arbor, Mich.

18-L-17 IDENTICAL TWINS WITH SCHOOL PHOBIA

Purpose: To gain insight into mechanisms of school phobias.
Subjects: Two sets of identical twins who manifested alternating or single twin school phobias.
Methods: Complete physical, psychological, and psychiatric examinations.
Duration: 1963-1964.
Investigator(s): William P. Moore, M.D., and Irvin A. Kraft, M.D., Chief, Division of Child Psychiatry, Houston State Psychiatric Institute, Houston, Tex.

18-L-18 CLINICAL STUDY OF ENURESIS IN CHILDREN

Purpose: To study the value of placebo, Elavil, and Tofranil in childhood enuresis.
Subjects: Children, ages 6 to 15, with evident bedwetting (two or more times a week).
Methods: Placebo used for one to two weeks; then Elavil is given in standardized dosage schedules. If child still wets after one to two months, drug is changed to Tofranil for comparison purposes.
Duration: 1963-1964.
Investigator(s): Irvin A. Kraft, M.D., Chief, Division of Child Psychiatry, and staff, Houston State Psychiatric Institute, Houston, Tex.

18-L-19 PSYCHOPHYSIOLOGY OF SLEEP AND DREAMING IN DEPRESSED PATIENTS AND CHILDREN

Purpose: To study sleep and dreaming patterns of depressed patients and children. Of particular interest will be the amount and patterning of sleep and dreaming during part of the night depressed patient is able to sleep and studies of relationship of time of early morning awakening to dream periods. Depressed patients are to be studied because sleep disturbance is a major portion of the illness and because usual pattern of awakening coincides with period of maximal dreaming in normal subjects. An attempt will be made to clarify developmental pattern of sleep and dreaming in children and to secure dreams of children from different developmental periods so that a collection of children's dreams will be available for analysis.
Methods: EEG will be used to measure levels of sleep and detect periods of REM (rapid eye movements) as outlined by Dement and Kleitman; basal skin resistance and GSR activity of subjects will also be studied during sleep.

On occasion other parameters such as heart rate, skin and body temperature will be measured. Studies of depressed patients will include two nights of sleep studies at beginning of hospitalization and another night following improvement. When feasible, extra nights of study will be utilized to awaken these patients during dreaming phase to collect dreams of depressed patients.
Investigator(s): David R. Hawkins, M.D., Professor of Psychiatry, and George C. Thrasher, M.D., Instructor in Psychiatry, University of North Carolina, Chapel Hill, N. C.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-L-20 DREAMING SLEEP IN AUTISTIC CHILDREN

Purpose: To look for variations in patterning and amount of dreaming in autistic children.
Subjects: Autistic children, aged 4 to 7 years.
Methods: Continuous EEG and polygraphic analysis during normal sleep.
Findings: Thus far, frequency and amount of dream time equal to that reported for normal children.
Duration: January 1964-not reported.
Investigator(s): Edward M. Ornitz, M.D., Staff Psychiatrist, Reiss-Davis Clinic; and Edward Ritvo, M.D., School of Medicine, University of California, Los Angeles, Calif.
Publication: Science.

18-L-21 EXPERIMENTAL STUDIES IN AUTISM: ESTABLISHMENT OF SOCIAL REINFORCERS

Purpose: Autism is a disturbance where there is no hierarchy of social reinforcers. Social reinforcers are established when coupled with both positive and negative primary reinforcers. This study proposes a classical operant conditioning technique in which autistic children would be able to establish a whole host of secondary social reinforcers.
Subjects: 3 boys and 1 girl, ages 5 to 9. Diagnosed as having schizophrenic disturbances of autistic type.
Methods: Use of food as positive reinforcer; minimal but bothersome electrical stimulus as negative reinforcer.
Findings: Behaviors have been established including social nonverbal (games, imitation, etc.) and verbal (speech and meaning). Learned behavior can be extinguished in many instances by noncontingent reinforcement.
Duration: June 1963-indefinite.
Investigator(s): O. Ivar Lovaas, Ph.D., Assistant Professor of Psychology, and James Q. Simmons III, M.D., Senior Psychiatrist and Chief, Child Psychiatry (Inpatient Service), Neuropsychiatric Institute, University of California, Los Angeles 24, Calif.

18-L-22 APPLICATION OF REINFORCEMENT PRINCIPLES IN THE TREATMENT OF AUTISTIC CHILDREN

Purpose: To develop techniques of behavioral modification applicable to autistic and schizophrenic children.
Subjects: At present, one 8-year old schizophrenic boy.
Methods: Use of food and other reinforcers are being systematically applied to problems of visual and auditory learning, both abstract and of normal social responses.
Findings: Extreme difficulty being found in trying to develop verbal behavior and differences between visual and auditory learning, the visual stimuli being more easily and accurately responded to.

Duration: April 1963-continuing.
Investigator(s): Montrose Wolf, Ph.D., Psychologist, Institute of Child Development, and Todd Risley, M.S., Graduate Student, University of Washington, Seattle; Hayden L. Mees, Ph.D., Clinical-Research Psychologist, Western State Hospital, Ft. Steilacoom, Wash. 98332.
Publication: Probably will not be published. Information will be available from investigators.

18-L-23 SCHIZOPHRENIA IN CHILDREN OF MENTAL PATIENTS

Purpose: To gain information about relative importance of hereditary factors as compared with early environmental factors in the etiology of schizophrenia.
Subjects: A group of children born to mentally ill women in Massachusetts mental hospitals; a group of children born in a Massachusetts institution serving obstetrical needs of illegitimately pregnant, underprivileged mothers.
Methods: Long term follow-up, by retrospective cohort study approach, to determine frequency of admission to mental hospitals as adults of members of the two study groups; comparison of these frequencies with expected frequencies based on general population experience.
Duration: April 1964-April 1966.
Investigator(s): Thomas F. Pugh, M.D., M.P.H., Associate Clinical Professor of Epidemiology, and Samuel G. McClellan, M.D., M.P.H., Research Associate, Department of Epidemiology, Harvard School of Public Health, Boston 15, Mass.
Cooperating group(s): Massachusetts Department of Mental Health; Massachusetts State Department of Public Welfare.

18-L-24 EXPERIMENTAL STUDIES OF CHILDHOOD SCHIZOPHRENIA

Purpose: To establish social and intellectual behaviors in schizophrenic children; to analyze current behavior repertoires.
Subjects: Schizophrenic children with autistic features, 4 to 11 years of age.
Methods: Conceptually, a reinforcement theory paradigm is followed; methodologically, a single subject replication design is followed.
Findings: Techniques produced acquisition of speech in mute children and acquisition of reading and writing in echolalic children. Social determinants of self-destructive behavior follow reinforcement theory paradigm.
Duration: Not reported-June 1965.
Investigator(s): Ivar Lovaas, Ph.D., Assistant Professor of Psychology, University of California, Los Angeles 24, Calif.
Publication: Papers in press.

18-L-25 CHILDHOOD EXPERIENCES LEADING TO OR CORRELATED WITH TRANSVESTISM OR TRANSSEXUALISM

Purpose: The prevention and/or therapeutic interference with the established compulsion.
Subjects: Children, all ages, evidencing transvestism or transsexualism.
Methods: Interview, hypnoanalysis.
Duration: March 1963-1965.
Investigator(s): Hugo G. Beigel, Ph.D., Sexologist (private practice), 138 E. 94th St., New York, N. Y. 10028.
Publication: To be published.

18-L-26 FACTORS IN ADOLESCENT SUICIDE ATTEMPTS

Purpose: To develop hypotheses concerning the etiology of attempted suicide in adolescence.
Subjects: 50 adolescents, aged 14 to 18, hospitalized in Los Angeles County General Hospital for an actual suicidal attempt.
Methods: Intensive psychiatric, psychological, and sociological study by means of interviews and specially designed questionnaires and treatment.
Duration: September 1963-August 1966.
Investigator(s): Joseph D. Teicher, M.D., Professor of Psychiatry, University of Southern California School of Medicine, and Director, Children's and Adolescent Psychiatric Services, Los Angeles County General Hospital, Los Angeles, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Papers and a monograph.

18-L-27 ASTHMA FOLLOW-UP STUDY

Purpose: To investigate variables that influence whether and when children "outgrow" asthma.
Subjects: Sample drawn from approximately 100 children treated in unit for asthma, on the average eight years ago.
Methods: Prediction of outcome of asthma based on psychotherapeutic material; follow-up interviews with patient and mother to assess asthma and general psychological status.
Investigator(s): John Lamont, M.D., Director, and Jack O. Rice, M.D., Child Psychiatry Unit, Massachusetts General Hospital, Boston, Mass.
Publication: Chapter in book: Schneer, H. I. ed., *The Asthmatic Child*, New York: Paul B. Hoeber, 1963.

18-L-28 FOLLOW-UP STUDY OF ASTHMATIC CHILDREN

Purpose: To study children now in adolescence who were seen in therapy during latency; to try to determine whether they still have asthma; if not, to ascertain time of and factors pertinent to its disappearance.
Subjects: A clinic population of mothers and children previously seen in casework and psychotherapy.
Methods: Psychiatric interviews with former patients and casework interviews with their parents. Prior to follow-up interviews, predictions are made based on knowledge of case and hypotheses concerning emotional components of the illness.
Duration: September 1963-summer 1965.
Investigator(s): John Lamont, M.D., Jack Rice, M.D., and C. Katz, M.S.S., Child Psychiatry Unit, Massachusetts General Hospital, Boston, Mass. (Reported by Grace Nicholls, M.S.S., Supervisor of Social Service, Child Psychiatry Unit, Massachusetts General Hospital.)

18-L-29 PSYCHIATRIC STUDY OF A FAMILY WITH VON GIERKE'S DISEASE

Subjects: Two parents and three male siblings; two siblings have Von Gierke's disease; mother and other sibling have positive blood factors for the disease.
Methods: Complete medical and psychiatric evaluations in a family cross-sectional study. Follow-up after one year of psychotherapy for parents only, to see effects on children, especially middle sibling who does not have clinical evidences of the disease but is most disturbed child.

Duration: 1964-1967.
Investigator(s): Mae McMillan, M.D., and Irvin Kraft, M.D., Chief, Division of Child Psychiatry, Houston State Psychiatric Institute, Houston, Tex.

18-L-30 PSYCHIATRIC STUDY OF CHILDREN WITH DYSTONIA MUSCULORUM DEFORMANS

Subjects: Two children with dystonia musculorum deformans. Both have had neurosurgical ablation procedures; one developed a severe psychosis nine years postoperatively and has been under psychotherapy.
Methods: Complete neurological and psychiatric histories were taken. Data from postoperative course are available. Novel treatment techniques evolved to work with neurological sequelae and their psychological components.
Duration: 1960-1965.
Investigator(s): Paul V. Ledbetter, Jr., M.S.W., and Irvin A. Kraft, M.D., Chief, Division of Child Psychiatry, Houston State Psychiatric Institute, Houston, Tex.

18-L-31 ARE THERAPY AND TRANQUILIZERS A CURE FOR ACTING OUT BRAIN-DAMAGED MENTALLY RETARDED CHILDREN?

Purpose: To determine the effect of therapy and tranquilizers on behavior of brain-damaged mental defectives who have been classified as having behavior problems.
Subjects: 16 children, ages 7 to 15.5 years, I.Q. range 40 to 70, who are residents of the Dixon State School.
Methods: Children are matched pair-wise on basis of whether brain damage was caused by infection or trauma and, secondly, by sex. Within each of the four categories subjects were matched according to age and I.Q. One member of each pair will be selected at random for experimental group; other member to control group. Four subjects in each group will receive tranquilizers while others will receive placebos. Testing will be done before and after to determine any change.
Duration: February 1964-January 1965.
Investigator(s): Paul Tillman, M.D., Assistant Superintendent, Barbara Mason, M.A., and Elizabeth Davis, M.A., Psychology Staff Members, Dixon State School, Dixon, Ill. (Reported by Anna P. Johnson, M.A., Psychologist III, Dixon State School.)
Publication: To be published.

18-L-32 AVOIDING INSTITUTIONALIZATION OF PSYCHOTIC CHILDREN

Purpose: To see if children who would ordinarily be referred to an institution can continue functioning in their own homes through the use of a tranquilizing agent, Stelazine; to examine the changes which take place to allow him to remain in the community.
Subjects: A sample of 50 psychotic children who would ordinarily be referred for institutionalization, divided into 2 groups matched for age and sex.
Methods: Experimental group will receive Stelazine; control group will receive placebo in a double-blind manner. Treatment will last 26 weeks. Evaluations made when child begins study, after one week, after 13 weeks, and at the end of 26 weeks. Dependent variables will be: (1) ability to function effectively within the community; and (2) measurement of child's intellectual functioning, personality traits, mood, social adjustment, and symptomatology. To obtain these measures, mother's reports to a psychiatric social worker, teacher's reports, psychiatric evaluation, and psychological testing will be employed.
Duration: 1963-August 1965.

BEST COPY AVAILABLE

Investigator(s): Richard M. Silberstein, M.D., Director, and Wallace Mandell, Ph.D., Director of Research, Staten Island Mental Health Society, Inc., 657 Castleton Ave., Staten Island 1, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-L-33 EFFECTS OF DRUGS ON INFORMATION PROCESSING IN EMOTIONALLY DISTURBED AND HYPERKINETIC CHILDREN

Purpose: (1) To determine effects of information on continuous performance tasks; (2) to study interaction of diagnostic category with drug response on attention and continuous performance tasks; (3) to study individual difference factors which determine attention and response to drugs.
Subjects: Inpatients at several institutions for emotionally disturbed and delinquent children; outpatient children referred for emotional problems and problems of learning in school.
Methods: A five-choice continuous performance apparatus presents colors and patterns in various combinations at fixed time intervals and rates (e.g. 1/sec.). Different amounts of uncertainty are used for different conditions, varying from one to four bits of information per stimulus. A stimulus-response matrix and reaction times give information regarding subject's errors, omissions and latencies of response. A five-tone auditory stimulus may be used as an additional distractor. A factored battery of objective personality tests is used to measure individual differences.
Duration: June 1964-June 1968.
Investigator(s): Leon Eisenberg, M.D., Professor of Child Psychiatry, and C. Keith Conners, Ph.D., Assistant Professor of Child Psychiatry, Johns Hopkins Hospital, Baltimore 5, Md.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Findings will be published in appropriate APA journals.

18-L-34 MODIFICATION OF BEHAVIORAL CHARACTERISTICS IN AUTISTIC CHILDREN USING LSD AND UML 491

Purpose: To determine, if possible, any usable modification of behavior in autistic children.
Subjects: Pair of homozygous autistic twins, 5 years of age.
Methods: In double blind fashion, subjects were administered 50 mg. of LSD 25 (lysergic acid diethylamide) in acute experiments and then studied in standard situations involving being alone or with investigator; clearly defined dependent variables were measured.
Findings: There was an increase in laughing and smiling behavior, decrease in self-stimulatory behavior, and increase in physical contact with investigator.
Duration: June 1963-September 1964.
Investigator(s): James Q. Simmons III, M.D., Senior Psychiatrist and Chief, Child Psychiatry (Inpatient Service); Stanley J. Leiken, M.D., Neuropsychiatric Institute; and O. Ivar Lovaas, Ph.D., Assistant Professor of Psychology, University of California, Los Angeles 24, Calif.
Publication: To be submitted to Archives of General Psychiatry in January 1965.

18-L-35 EFFECT ON CHILDREN OF SHORT-TERM INTENSIVE TREATMENT

Purpose: To determine the effect of short-term, intensive treatment on patients in a children's psychiatric hospital.
Subjects: Approximately 100 preadolescent and adolescent youngsters, 5 to 16

years of age.
Methods: Patient's progress for five years after discharge from hospital will be followed by all members of the clinical team. The psychiatrist will annually interview the patient, and the psychologist will retest him at the same time. Additionally, the social worker will assess any changes in the environmental situation that occurs.
Duration: January 1964-January 1970.
Investigator(s): Douglas Powers, M.D., Director, Virginia Treatment Center for Children and Associate Professor, Medical College of Virginia, Richmond, Va.
Cooperating group(s): Virginia State Department of Mental Hygiene and Hospitals.
Publication: Publication planned in psychiatric, psychological, and social work journals.

18-L-36 ON CHILDHOOD PSYCHOSIS

Purpose: To obtain further information about the treatment of psychotic children, with special emphasis on ego functioning.
Subjects: Psychotic children.
Methods: Electrical recordings, therapists' summaries, and repeated psychological testing are basic techniques for gathering information. Thus far, research has been essentially clinical in nature, although it is planned to develop a formal research investigation; proposed area of investigation is use of "distance" as a psychological mechanism.
Findings: Findings have been clinical in nature and are in part already reported in the literature with additional reports to appear in the near future (e.g., an article by Dr. Rudolf Ekstein deals with theoretical explanation of echolalia on basis of clinical investigation; indices for evaluation of ego process on the Rorschach; and the emergence of parallel process in child and parent).
Duration: July 1962-indefinite.
Investigator(s): Rudolf Ekstein, Ph.D., Director, Elaine Caruth, Ph.D., Research Clinical Psychologist, and Mortimer M. Meyer, Ph.D., Director of Psychological Services, and staff, Reiss-Davis Clinic for Child Guidance, 9760 W. Pico Blvd., Los Angeles 35, Calif.

18-L-37 CLINICAL STUDY OF USE OF DREAMS IN THE PSYCHOTHERAPY OF ADOLESCENTS

Subjects: Adolescent boys and girls seen for treatment.
Methods: Dreams are collected at diagnostic meeting and during treatment; various techniques for using manifest and latent content are tried and evaluated.
Duration: 1958-1965.
Investigator(s): Irvin A. Kraft, M.D., Chief, Division of Child Psychiatry, Houston State Psychiatric Institute, Houston, Tex.
Publication: Preliminary report delivered before meeting of American Academy of Child Psychiatry, 1963.

18-L-38 GROUP PSYCHOTHERAPY OF PRESCHOOL PSYCHOTIC CHILDREN AND COLLATERAL GROUP THERAPY OF THEIR PARENTS

Purpose: An initial study (Bulletin 15, Research Relating to Children) revealed group therapy was feasible in children 33 to 48 months of age. A second study is now underway to determine feasibility of treating psychotic children aged 19 to 33 months.
Subjects: Eight children, 19 to 33 months old, diagnosed as childhood psychotics.

Methods: Group therapy with parents and children.

Findings: Group therapy with preschool psychotic child and collateral group therapy with parents is a feasible technique of treatment.

Duration: 1963-indefinite.

Investigator(s): Rex W. Speers, M.D., Assistant Professor and Director of Child Psychiatry, Cornelius Lansing, M.D., Assistant Professor of Psychiatry, and Robert Hughes, Ph.D., Assistant Professor of Psychology, School of Medicine, University of North Carolina, Chapel Hill, N. C.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: Preliminary report of first two years published in *American Journal of Orthopsychiatry*, 34:4:659-666, July 1964. Book to be published by University of North Carolina Press.

18-L-39 STUDENT VOLUNTEERS WITH TROUBLED CHILDREN

Purpose: Demonstration project to assess weaknesses and strengths of having students from four different kinds of colleges work weekly in friendship roles with troubled children in a rural area.

Investigator(s): William E. Mitchell, M.A., Project Director, Hope Foundation, Montpelier, Vt.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: Yearly reports and professional papers.

18-L-40 CLINICAL STUDY OF ADOPTED CHILDREN SEEN IN PSYCHIATRIC CONSULTATION

Purpose: To study statistically the adopted children seen for psychiatric consultation at the Houston State Psychiatric Institute.

Subjects: 40 or more adopted children and 400 natural children seen for psychiatric consultation.

Methods: Each subject is coded for approximately 80 behavioral variables. Computer analysis is made to determine what significant correlations emerge in each group and among subgroups.

Duration: 1962-1964.

Investigator(s): Irvin A. Kraft, M.D., Chief, Division of Child Psychiatry, Houston State Psychiatric Institute, Houston, Tex.

18-L-41 FOLLOW-UP STUDY AT CHILD PSYCHIATRY CLINIC

Purpose: A follow-up of all children seen in the University of Florida Child Psychiatry Clinic since its inception in 1959.

Methods: (1) Mechanical collations of data from charts in a uniform way involving diagnostic categories and types of treatment used; (2) definite follow-up visits by staff child psychiatrists of selected groups of patients, either by diagnostic category or by date of discharge from clinic. Material will be available for a variety of follow-up projects.

Duration: March 1964-March 1966.

Investigator(s): R. Dean Coddington, M.D., Assistant Professor of Pediatrics and Psychiatry, Child Psychiatry Clinic, College of Medicine, University of Florida, Gainesville, Fla.

Cooperating group(s): Council for Research and Training in Mental Health, Florida State Board of Health.

Publication: To be published.

18-L-42 SUCCESS AND FAILURE IN EDUCATIONAL THERAPY--A FOLLOW-UP STUDY OF DISTURBED CHILDREN TREATED IN DAY CARE

Purpose: To describe the psychiatric and social-psychiatric dynamism in the success or failure of 426 former patients of the Educational Therapy Center following their release from treatment.
Methods: A detailed analysis will be made of the complex factors which contributed to the subject's emotional state at time of intake, to the complex and interwoven factors which had an impact on them while under treatment, as well as those that contributed: (1) to the maintenance or undoing of success after dismissal from treatment; or (2) to a belated recovery independent of therapeutic impact, or as an aftermath of it.
Duration: September 1963-continuing.
Investigator(s): Hertha Riese, M.D., Psychiatric Director, Educational Therapy Center, 201 North 19th St., Richmond, Va. (Reported by NCCD.)
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-L-43 REHABILITATION OUTCOMES OF FORMER STATE MENTAL HOSPITAL PATIENTS

Purpose: To develop a set of strategies to induce highest likelihood of successful community placements for former state mental patients.
Subjects: Teenagers and adults in three different community locations.
Methods: College undergraduates serve as research assistants over a three-month follow-up check of recently discharged patients.
Findings: Tentatively it has been found that male teenagers fare more successfully on the average in semi-industrialized, nontransient hotel locations than adults (25 to 40 years) in boarding home situations.
Duration: June 1963-June 1965.
Investigator(s): Donald L. Cohen, M.S.W., Instructor in Sociology and Anthropology, Pennsylvania State University, University Park, Pa.

Delinquency

Note: Some studies appearing in this section were selected from Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency published by the National Council on Crime and Delinquency in New York. Studies thus obtained are noted: (Reported by NCCD.)

18-M-1 A STUDY OF UNDETECTED DELINQUENCY

Purpose: To discover the frequency of delinquent behavior and its distribution by certain demographic characteristics; to describe the causative factors of such acts.
Subjects: Random sample of boys and girls, 13 to 16 years old, residing in the school district of a Michigan city of 200,000 population.
Methods: Interviews.
Findings: Thus far, about 70 percent of subjects reported their delinquent behavior honestly and completely when interview instrument was validated.
Duration: Not reported-June 1965.
Investigator(s): Martin Gold, Ph.D., Assistant Program Director, Donald Halsted, [illegible]Ph.D. Candidate), Instructor in Education, and Safia Kassim Mohsen, LL.D., Research Assistant, Institute for Social Research, University of

Michigan, Ann Arbor, Mich.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Paper to be read at American Psychological Association convention, 1964; monograph to be printed.

18-M-2 DELINQUENCY SURVEY IN EAST ST. LOUIS, ILLINOIS

Purpose: To determine the incidence, extent, and location of juvenile delinquency in East St. Louis. Information will be used for planning delinquency prevention programs in East St. Louis.
Subjects: All youths between the ages of 8 and 19 who have committed acts which violated state, federal, or community statutes between June 1, 1962 and May 31, 1963.
Methods: Records in enforcement agencies were consulted for compilation of data.
Duration: July 1963-September 1964.
Investigator(s): Albert H. Baugher III, B.S., Research Assistant, Delinquency Study Project, Southern Illinois University, Edwardsville, Ill. (Reported by Charles V. Matthews, Associate Professor and Director, Delinquency Study Project, Southern Illinois University.)
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Mimeographed copies will be available in the fall of 1964.

18-M-3 AN ECOLOGICAL STUDY OF DELINQUENCY IN HAMILTON

Purpose: An analysis of the ecological distribution of all Juvenile Court cases for each of the years from 1956 to 1962, and of all Juvenile Bureau apprehensions for the years 1961 and 1962.
Methods: Demographic factors, such as age, religion, sex, school attended, offense, and disposition are recorded and analyzed. A variety of comparisons are being made between the high and low delinquency rate areas in Hamilton, and factors related to rate changes in these areas are explored.
Findings: Indicate more change in high delinquency rate areas from year to year than is assumed by current delinquency studies and theory in other cities.
Duration: August 1962-August 1964.
Investigator(s): Sid Blum, M.A., Research Associate, Social Planning Council of Hamilton and District, 220 Main St. West, Hamilton, Ont. (Reported by NCCD.)
Cooperating group(s): Juvenile Bureau, Hamilton Police Department; Juvenile Court, City of Hamilton.
Publication: Juvenile Delinquency in Hamilton (mimeographed), available from the Social Planning Council.

18-M-4 DETERMINATION OF ETIOLOGIC TYPES AMONG "TRUE" DELINQUENTS

Purpose: To determine the major trait-factor patterns that distinguish 500 "true" delinquents from a matched sample of 500 nondelinquents, with a view to determining etiologic gradations from the most powerful to the least powerful patterns. Once the general etiologic types are arrived at, these types will be related to body build and to certain behavioral factors already found in Unraveling Juvenile Delinquency (Cambridge: Harvard University Press, 1950), to differentiate delinquents from nondelinquents. Subsequently, the etiologic types will be keyed into findings of follow-up study to age 32 of boys originally described in Unraveling Juvenile Delinquency at 11 to 17.
Methods: Statistical intercorrelational technique.

Duration: February 1962-indefinite.
Investigator(s): Sheldon Glueck, Ph.D., Roscoe Pound Professor of Law, Eleanor T. Glueck, Ph.D., Research Associate in Criminology, and staff, Law School, Harvard University, Cambridge 38, Mass. (Reported by NCCD.)
Cooperating group(s): American Child Guidance Foundation.
Publication: Family Environment and Delinquency, Boston: Houghton Mifflin Co., 1962.

18-M-5 A PSYCHOMETRIC STUDY OF THE YOUNG OFFENDER

Purpose: To determine the incidence of mental illness and mental deficiency among young offenders appearing in the Toronto Magistrates Court; to identify personality differences, if any, between classes of offenders; and to determine how the youthful offender differs from offenders of similar socio-economic status in terms of intelligence, personality, parent-child relations, and physical illness.
Subjects: A representative sample of youthful offenders (ages 16 to 21) stratified by broad type of offense. A control group of nonoffenders.
Methods: Administration of the Raven Matrices; Cornell Medical Index; MMPI; Parent-Child Relationship Questionnaire; WAIS administration for those falling below 25th percentile on Raven norms.
Duration: March 1963-December 1964.
Investigator(s): Dr. H. C. Hutchison, 7 Queens Park Crescent, Toronto, Ont. (Reported by NCCD.)
Cooperating group(s): Probationers' Aid Committee; Rotary Club of Toronto; Ontario Department of Health; Toronto Magistrates Courts.

18-M-6 A STUDY OF JUVENILE DELINQUENTS 16 TO 18 YEARS OLD

Purpose: To determine the degrees of maturity of subjects on somatic, psychological, and social levels; to attempt to establish criteria that will permit a more rational decision on: (1) legal disposition and institutional commitment for this particular age group; and (2) choice among the different legal solutions which are provided in the draft codes at present under study in Belgium.
Subjects: 200 boys, aged 16 to 18 years, who have committed an offense and have been brought before the juvenile court or have been transferred to ordinary courts.
Duration: October 1963-not reported.
Investigator(s): A. Racine, C. Somerhausen, G. Lejour, G. Renard, Chr. Debuyst, and R. Volcher, Centre d'Etude de la Delinquance Juvenile, 49 rue de Chatelain, Brussels 5, Belgium. (Reported by NCCD.)

18-M-7 ADOLESCENT GIRLS IN APPROVED SCHOOLS

Purpose: To study a large sample of girls admitted to the former Shaw Classifying School between 1950 and 1957; studies include overt problems, intelligence, educational functioning, and personality.
Methods: Individual and group intelligence tests; sentence completion and other tests of educational functioning. Training needs of girls and their subsequent success or failure in the training schools and during aftercare will be carefully studied.
Duration: December 1962-1964.
Investigator(s): Helen J. Richardson and Dr. Gordon Rose, Department of Social Administration, University of Manchester, Manchester, England. (Reported by NCCD.)
Cooperating group(s): Calouste Gulbenkian Foundation.

18-M-8 JUVENILE NONDELINQUENTS WHO BECAME DELINQUENTS

Purpose: After completion of Unraveling Juvenile Delinquency in which 500 serious delinquents were compared with 500 nonoffenders, a follow-up of both groups was undertaken (Bulletin 7, Research Relating to Children). Among many items, the follow-up encompasses the criminal histories of the boys from the time they were included in the Unraveling study until age 32. In the course of this inquiry it was discovered that some of the nondelinquents have become serious offenders. An analysis is being made of these findings and will eventually be presented as part of the follow-up inquiry.
Duration: July 1963-June 1965.
Investigator(s): Sheldon Glueck, Ph.D., Roscoe Pound Professor of Law, and Eleanor T. Glueck, Ph.D., Research Criminologist, Law School, Harvard University, Cambridge 38, Mass.
Cooperating group(s): Ford Foundation; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Unraveling Juvenile Delinquency, Cambridge: Harvard University Press, 1950.

18-M-9 A STUDY OF FACTORS INFLUENCING CHILD AND ADOLESCENT DELINQUENCY

Purpose: To discover the factors which influence child and adolescent delinquency in Medellin and in the Department of Antioquia.
Methods: Data collected include biographical information, medical history, home and other environmental circumstances, delinquency history, psychological data on intelligence, personality, character deficits, etc. Statistical analyses are made on basis of these data. Complete files exist for 8,000 boys committed since 1956; some data are available on an additional 16,000.
Duration: February 1956-continuing.
Investigator(s): Dr. Miguel Brinon Mercant, Certified Psychologist, Institute NTRA SRA de Luch, Calle 10, Numero 28-22, El Poblado, Medellin, Colombia. (Reported by NCCD.)
Cooperating group(s): City of Medellin, Colombia; Municipal Social Service.

18-M-10 SURVEYS OF PROBLEMS OF ADOLESCENTS IN NAIROBI, KENYA

Purpose: Apart from the report already published concerning juvenile prostitutes in Nairobi, four other surveys are underway: (1) an intensive study into the histories of 400 semidelinquent adolescent boys who have failed to remain in school; (2) an investigation of the causes of vagrancy as described by some 250 African juveniles; (3) an analysis of social life and problems of 400 Asian boys and 200 Asian girls; and (4) an attempt to apply the Beve Anthony Family Relationships Test to the extended family concepts of African children, with special regard to indications of emotional disturbances. Very little work of this type has been done in Kenya and problems of standardization are considerable.
Duration: February 1961-continuing.
Investigator(s): Rev. Julius I. Carlebach, c/o Barclays Bank, 543 Norwood Rd., London S.E. 27, England. (Reported by NCCD.)
Cooperating group(s): Child Welfare Society of Kenya; Associations of Youth Centres, Kenya; Kenya-Israel Rural Social Workers Training School.
Publication: Juvenile Prostitutes in Nairobi (East African Studies Number 16): Kampala, 1962.

18-M-11 MENTAL ABILITY AS A FACTOR IN JUVENILE TRAFFIC LAW VIOLATIONS

Subjects: 375 male and 7 female juvenile traffic law violators apprehended during the period February-October 1962 at the Otsu District Prosecutor's Office.
Methods: Administration of Tanaka's I.Q. test B-1 and Kraeplin-Uchida Achievement Test.
Findings: 63 percent of violators had I.Q.'s of 90 and above; 20 percent had I.Q.'s in 80-89 range; 14 percent had I.Q.'s below 79. 30 percent tested normal on the Kraeplin-Uchida test; 61 percent intermediate; and 8 percent abnormal.
Duration: February 1962-April 1963.
Investigator(s): Takashi Kasamatsu, 458 Tsubaki-Machi, Otsu-Shi, Shiga Prefecture, Japan. (Reported by NCCD.)
Cooperating group(s): Otsu Juvenile Detention and Classification Home; Otsu District Public Prosecutor's Office.

18-M-12 ITEM ANALYSIS OF THE HSPQ AND THE DEVELOPMENT OF A DELINQUENCY SCALE FOR THAT INSTRUMENT

Purpose: To discover whether there exists a pool of empirically derived items of the High School Personality Questionnaire (HSPQ) that differs significantly from the population at large.
Methods: A relatively small, but randomly selected sample of HSPQ profiles drawn from a delinquent population will be used. Item by item, the number of true and false responses will be counted to determine significant items in the delinquent population. From this, a scoring key will be developed with items weighted on the basis of magnitude of significance of difference from the population at large.
Findings: From examining profiles individually, it is clear that certain items very clearly deviate from a 50/50 hypothesis of chance alone.
Duration: November 1961-indefinite.
Investigator(s): George R. Pierson, Ed.D., Chief, Psychological Services, Green Hill School, Washington State Department of Institutions, Chehalis, Wash.
Publication: To be published.

18-M-13 APPLICATION OF COLORS TO TECHNIQUES OF CLASSIFICATION

Purpose: To study the possibility of discerning individual personality characteristics through freely drawn pictures and reactions to the Color Gestalt Test.
Subjects: 225 juvenile delinquents, ages 14 to 20. Nondelinquent controls.
Methods: Subjects were instructed to draw anything they wanted except the objects they could see or imitate in the test situation. A sheet of paper containing a 25 x 20 centimeter square equally sectioned into 32 small triangles, was colored by subjects into any design they wanted to make. They could color more than one triangle in one color, and could ignore straight lines if they wished to make circular or elliptical designs.
Findings: Freely drawn pictures did not reflect objects in subjects immediate surroundings or local environments, and subjects were unable to explain why they had wanted to draw such pictures. Noticeable personality differences were found when subjects were grouped according to color schemes they used frequently on the Color Gestalt Test. Differences related to attitudes, intelligence, and delinquency were found in designs colored.
Duration: May 1959-May 1964.
Investigator(s): Kozo Ono, Akita Juvenile Detention and Classification Home, 1-4 Shimo Yatsuhashi, Yatsuhashi, Akita-shi, Japan. (Reported by NCCD.)

18-M-14 THE JUVENILE GANG LEADER: A SELF-PORTRAIT

Purpose: To clarify present-day conceptions of the juvenile gang leader by accumulating and analyzing a number of "autobiographies" of such leaders.
Subjects: 14 male members of juvenile gangs in Los Angeles: 9 Negroes, 4 Mexican-Americans, and 1 white, ranging in age from 14 to 21 years.
Methods: Data were obtained in tape-recorded interviews with gang leaders. Candidates for interviews were named by street-worker staff, police, parole officers, and by gang-study staff in another agency; participants in the interviews were volunteers from among the nominees. Interviews were semistructured. After transcription, the interview materials were reorganized in chronological sequence to secure autobiographical statements of the gang leaders' careers, viewpoints, and so on.
Findings: Selected materials from the project are being incorporated in the study, *The Juvenile Gang: Structure and Function as Perceived by Gang Leaders*.
Duration: December 1963-June 1965.
Investigator(s): Roger E. Rice, M.A., Research Analyst, and Stuart Adams, Ph.D., Research Director, Los Angeles County Probation Department, Los Angeles, Calif.
Publication: Report to be released by the Research Office, Los Angeles County Probation Department.

18-M-15 THE SELF-CONCEPTION AND SIGNIFICANT OTHERS OF YOUTHFUL FELONS

Purpose: It is hypothesized that the self-conception of youthful felons is a function of significant others in and out of prison.
Subjects: 55 percent of all youthful felons committed under the Federal Youth Corrections Act to the Youth Corrections Center, Lorton, Virginia.
Methods: Panel study method used in interviewing groups of prisoners at different stages in their correctional experience.
Duration: May-December 1963.
Investigator(s): William Nardini, Ph.D., Chief of Research, and Donald Clemmer, Department of Research Corrections, Institute for Criminological Research, Lorton, Va. (Reported by NCCD.)
Cooperating group(s): District of Columbia Youth Corrections Center, Lorton, Va.

18-M-16 A COMPARATIVE STUDY OF DELINQUENTS AND NONDELINQUENTS IN SPRINGFIELD, MISSOURI

Purpose: To test for significant differences between delinquents and nondelinquents with regard to their perception of persons who represent legitimate and illegitimate value systems and with regard to any difference in their self-concept in relation to the legitimate value system.
Subjects: Matched pairs of male delinquents and nondelinquents, ages 14 to 16, drawn from the public high schools in Springfield, Mo.
Methods: A modified version of the Kelly Role Construct Repertory Test and the Kuhn Twenty-Statements Test were administered individually to each person in the sample. Findings were statistically analyzed.
Findings: Research hypotheses were confirmed in each case. A significant difference was found between the delinquent and nondelinquent perception of persons who represent legitimate and illegitimate value systems. A significant difference was found in the delinquent and nondelinquent self-concept in relation to the legitimate value system.
Duration: August 1962-June 1963.
Investigator(s): Ivan Chapman (Ph.D. Candidate, University of Missouri), 2207 Virginia Ave., Springfield, Mo.

18-M-17 PLANNING AND RISK-TAKING AS VARIABLES IN JUVENILE DELINQUENCY

Purpose: To investigate whether risk-taking tendencies and degree to which future plans have been formulated are related to recidivism.
Subjects: Adolescent delinquent boys committed by a juvenile court and placed in a residential group care setting by a local public child welfare agency.
Methods: Appropriate measures of the concepts will be developed and correlated with criteria of recidivism.
Duration: February 1964-1965.
Investigator(s): Samuel C. Fulkerson, Ph.D., Associate Professor, University of Louisville, Louisville, Ky. (Reported by L. C. Carpenter, Superintendent, Louisville and Jefferson County Children's Home, Anchorage, Ky. 40001.)
Cooperating group(s): Louisville and Jefferson County Children's Home.

18-M-18 COMPARISON OF DELINQUENTS WITH THEIR SIBLINGS

Purpose: To test the following hypotheses: (1) delinquents will be more maladjusted than their nondelinquent siblings; (2) siblings of social delinquents will be less maladjusted than siblings of solitary delinquents, with siblings of mixed delinquents falling in an intermediate position; (3) social delinquents will be less maladjusted than solitary delinquents, with mixed delinquents in an intermediate position; and (4) solitary, social, and mixed delinquents will differ as to type and nature of offense committed as demonstrated in their patterns of delinquency.
Subjects: A sample of delinquent adolescent males, aged 13 to 18 years, drawn from juvenile hall of a large metropolitan county.
Methods: Minnesota Multiphasic Personality Inventory and California Psychological Inventory will be administered to each subject to measure adjustment. Various samples will then be compared on mean MMPI and CPI scores for various scales.
Duration: September 1963-September 1964.
Investigator(s): Harold Richardson, Ph.D., Associate Professor of Psychology, Julian B. Roebuck, Ph.D., Associate Professor of Sociology, San Jose State College, San Jose; and Thomas Eblen, Juvenile Hall Case Worker and Assistant Probation Officer, San Mateo County Probation Department, San Mateo, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-M-19 FAMILY AND PEER RELATIONS OF GANG DELINQUENTS

Subjects: Negro and white gang members; lower class nongang members; middle class nongang members.
Methods: Interviews; psychological tests.
Duration: May 1964-1966.
Investigator(s): Robert A. Gordon, Ph.D., Assistant Professor of Social Relations, Johns Hopkins University, Baltimore 18, Md.
Cooperating group(s): Social Science Research Council.
Publication: To be submitted to professional journals.

18-M-20 CHILDHOOD PREDICTORS OF NEGRO MOBILITY AND CRIMINALITY

Purpose: To investigate nature of interaction of class position and deviant behavior. Two hypotheses will be tested: (1) high rate of Negro crime and family disruption can largely be accounted for by low socio-economic status of Negroes; (2) obverse hypothesis, that the heavy concentration of Negroes in the lower class in metropolitan centers is a consequence of high rate of

juvenile crime and antisocial behavior of Negro boys and of Negro boys' experience with fathers who themselves have high rates of antisocial behavior expressed by desertion and nonsupport of their families.
Subjects: A sample of a total urban population of Negro boys of normal I.Q., still living in the city of their birth.
Methods: A longitudinal study evaluating the relative importance of childhood socio-economic status, childhood behavior problems, lack of a father in the childhood home in determining adult socio-economic status, and their adult arrest records. A number of social and psychiatric variables, which appear related to ability to overcome handicaps existing in childhood, will also be evaluated.
Duration: 1963-1968.
Investigator(s): Lee N. Robins, Ph.D., Research Associate Professor of Sociology, and George E. Murphy, M.D., Assistant Professor of Psychiatry, Department of Psychiatry and Neurology, Medical School, Washington University, St. Louis 10, Mo.
Cooperating group(s): National Institute of Mental Health, Public Health Sefvice, U. S. Department of Health, Education, and Welfare.

18-M-21 ADOLESCENTS LOST IN THE CITY: THE INFLUENCE ON JUVENILE DELINQUENCY OF HOUSING AND THE URBAN ENVIRONMENT

Purpose: To investigate the influence of housing, building structure, and community environment on juvenile delinquency; to conduct a statistical and typological study leading to recommendations for urban planning.
Subjects: Eight sample districts of 16 hectares each (39.5 acres) in delinquent and nondelinquent areas of the city of Lyons.
Methods: Study is based on data furnished for the Juvenile Court for Greater Lyons for the years 1956 through 1959, and data from the National Institute of Statistics and Economic Studies.
Duration: 1958-1963.
Investigator(s): M. Paul Froidevaux and staff, Centre d'Informations Urbaines et Sociales, 107 Rue Boileau, Lyons 6, France. (Reported by NCCD.)
Cooperating group(s): Institut National d'Hygiene.

18-M-22 THE FORMATION OF CRIMINAL SUBCULTURES IN THE MILIEU OF ADOLESCENTS IN MONTREAL

Purpose: To test certain hypotheses by Sellin and Sutherland on the true socio-cultural origin of deviant behavior. With the help of psycho-sociological techniques in which psychological and biological variables will be controlled, the orientation of the value systems and outlook on the world of mentally healthy juvenile delinquents will be clarified.
Subjects: Several groups of juvenile delinquents who are engaged, in differing degrees, in stable and permanent criminal careers.
Duration: June 1963-1965.
Investigator(s): Denis Szabo, D.Sc., Assistant Professor of Sociology and Anthropology, and Henri F. Ellenberger, Faculte des Sciences Sociales, University of Montreal, Montreal 26, Que. (Reported by NCCD.)
Cooperating group(s): Foundation Richelieu de Montreal; Conseil des Arts du Canada.

18-M-23 STUDY OF THE COMMUNITY CONTEXT OF DELINQUENT BEHAVIOR

Purpose: The instrumental theory of delinquency suggests that the determinants of delinquent behavior lie primarily in the patterned world of the adolescent subculture rather than in disturbed psyches or economic conditions.

This study proposes to examine the extent of the adolescent subculture in a large city, to establish its relationship to the community of which it is a part, and to develop methods for detecting delinquent populations and for distinguishing the attitudes of the habitual delinquent from those of the nondelinquent.
Duration: 1963-1965.
Investigator(s): Joseph D. Lohman, Dean, School of Criminology, University of California, Berkeley 4, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-M-24 THE JUVENILE GANG: STRUCTURE AND FUNCTION AS PERCEIVED BY GANG LEADERS

Purpose: To describe the manner in which delinquent gangs are organized and operate by using autobiographical materials from juvenile gang leaders as basic data for the description.
Subjects: 13 gang youth from various sectors of Los Angeles, predominantly minority group members, selected on basis of their willingness to serve as subjects in recorded interviews and also because of their reputations as gang leaders.
Methods: Data for project were taken from tape recordings of interviews that were transcribed verbatim. Materials relating to structure or operation of gangs were identified and abstracted for organization into a report on leaders' perceptions of characteristics of their gangs.
Findings: Los Angeles area gangs are relatively cohesive groups. Leaders tend to emerge rather than be chosen. "Intelligence" is perceived to be the most important quality possessed by gang leaders. Membership includes an active hard core numbering 10 to 25 members, and a less active contingent sometimes numbering in the hundreds. Structure is conditioned by age and size differentiation within the gang. Most gangs have a girl gang affiliate, and girls are perceived to be sources of trouble. Gangs function primarily for defensive purposes. In this rôle, they are continually harassed by the significant power structure of the community.
Duration: December 1963-June 1965.
Investigator(s): Roger E. Rice, M.A., Research Analyst, Stuart Adams, Ph.D., Research Director, and Rex Christensen, B.A., Probation Director, Los Angeles County Probation Department, Los Angeles, Calif.
Publication: Report to be released by the Research Office, Los Angeles County Probation Department.

18-M-25 ATTRIBUTIONS OF DELINQUENCY AND THEIR IMPACT ON YOUTH

Purpose: To identify the consequences that follow the attribution of delinquent definitions to boys; to study variations in these consequences as a function of characteristics of youth and of different conditions in the definitional process. Basic hypothesis is that the process of being defined as delinquent has significant effects on the youth's self-concept, aspirations, interpersonal associations, participation in delinquent behavior, and subsequent life career.
Methods: Pre-delinquent and delinquent youth will be studied longitudinally, beginning before they are so identified, and will be studied as they move through the various community agencies involved in definition and control of delinquent behavior. In addition to longitudinal research, several experimental studies will be conducted to reveal criteria used by various persons in the community (including teachers, police officers, and social workers) to identify delinquent youth. The first two years of the project will be devoted to pilot studies designed to solve certain methodological problems involved in longitudinal research.

Duration: 1962-indefinite.
Investigator(s): Irving Piliavin, D.S.W., and Joseph S. Briar, D.S.W., Assistant Professors of Social Welfare and Assistant Research Analysts, School of Social Welfare, University of California, Berkeley 4, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-M-26 A THEORY AND COMPARISON OF FEMALE AND MALE DELINQUENCY

Purpose: Comparisons of male and female delinquency show that girls have a much lower rate of delinquency than boys and are more prone to sex offenses and family offenses. This study will attempt to relate these differences to the different sex role objectives for boys and girls.
Subjects: 224 adolescents in Flint, Michigan divided into 4 groups of male and female delinquents and male and female nondelinquents, and matched for social class, age, I.Q., and school grade.
Methods: Trained interviewers used a pretested interview schedule in spring of 1961.
Findings: Findings confirm that boys strive more for social status and girls more for relational success and personal acceptance. Delinquents suffer deprivations in both areas, but female delinquents particularly have more relational problems than the other groups. An unexpected finding suggests that girls who are blocked from their social goals are more likely to become apathetic and alienated from them, while boys who are blocked in reaching their goals are more likely to seek deviant means of reaching them.
Duration: Not reported-1963.
Investigator(s): Ruth Rittenhouse, Doctoral Candidate, University of Michigan, Ann Arbor, Mich. (Reported by NCCD.)
Publication: Dissertation, University of Michigan.

18-M-27 A STUDY OF DELINQUENT TYPOLOGY

Purpose: To isolate delinquent personality types and to study the relationship of these types to recidivism, treatability, prognosis, etc.
Methods: Several approaches may be used. A large sample of personality factor profiles has been gathered and a pattern similarity coefficient (rp) between each individual and every other individual in the sample has been computed. Factor or cluster analysis will likely be employed.
Duration: October 1962-indefinite.
Investigator(s): George R. Pierson, Ed.D., Chief, Psychological Services, Green Hill School, Washington State Department of Institutions, Chehalis, Wash.
Publication: To be submitted to an appropriate journal.

18-M-28 VIOLENCE

Purpose: To investigate the many different psychological and social characteristics, operating in differing degrees and overlapping in some cases, which characterize a subgroup of boys convicted of violence.
Subjects: 94 boys, aged 16 to 20, from London and the home counties, who have been sentenced to prison, borstal, or detention centers.
Methods: Interviews with each subject. If subject and his mother agree, home visits and interviews are held. These last four to four and one-half hours.
Investigator(s): Dr. Charlotte Banks, Chairman, Department of Child Psychology, University College, Gower St., London W.C. 1, England. (Reported by NCCD.)
Cooperating group(s): Ford Foundation; Home Office.
Publication: *Howard Journal* 11:1:1-13, 1962.

18-M-29 PROJECTIVE PREDICTION OF ASSAULTIVE BEHAVIOR

Purpose: Project entails the specification of assaultive behavior by quantifying responses to two projective instruments: Rorschach and Hand Tests. Prior research has largely ignored these variables; in fact, the paucity of experimental results precludes the formulation of specific hypotheses at this time.
Subjects: 10 assaultive and 11 nonassaultive adult inmates of Southern Michigan State Prison in Jackson; 30 assaultive and 30 nonassaultive equated juvenile delinquents, referred for psychological testing by Summit County Juvenile Court in Akron, will be used in pilot and exploratory studies. Approximately 30 assaultive and 30 nonassaultive matched current referrals to Summit County Juvenile Court will be selected for Rorschach cross validation and Hand test validation.
Methods: Rorschach protocols for all groups will be scored using the Fisher and Cleveland "Barrier" and "Penetration" content scales. Hand Test will be used in an attempt to predict assaultive behavior using just the Rorschach cross-validation sample.
Findings: Preliminary findings suggest that only the Hand Test may be able to reliably discriminate assaultiveness from nonassaultiveness.
Duration: June-September 1963.
Investigator(s): John A. Popplestone, Ph.D., Assistant Professor; Edwin E. Wagner, Ph.D., Assistant Professor; and Roger E. Hawkins, Teaching Assistant, Department of Psychology, University of Akron, Akron, Ohio. (Reported by NCCD.)
Cooperating group(s): Summit County Juvenile Center; Southern Michigan State Prison, Jackson; National Science Foundation.

18-M-30 PREDICTION AND MEASUREMENT OF PERSONALITY CHANGES IN BOYS COMMITTED AS DELINQUENTS

Purpose: To measure changes in identifications of delinquent boys as result of a stay in treatment-oriented training school.
Subjects: 49 delinquent boys.
Methods: Measures of identification on Kelly's Role Construct Repertory Test compared before and after institutionalization.
Findings: Identification with authority figures increases, as well as ability to identify with others; identification with delinquents decreases. Greatest positive changes take place in boys showing most pathology when committed.
Duration: August 1963-August 1964.
Investigator(s): Donald Lederman, Ph.D., Chief Psychologist, James Hurd, M.A., and William Naylor, M.A., Psychologists, Iowa Training School for Boys, Eldora, Iowa.
Publication: To be published in Crime and Delinquency.

18-M-31 PILOT STUDY OF PERSONALITY VARIABLES FOR USE IN PREDICTION AND FOLLOW-UP OF POST-TREATMENT LIFE ADAPTATION OF DELINQUENT BOYS

Purpose: (1) To test whether certain personality characteristics evolved through experience in past research at Wiltwyck have predictive value for future life adaptation of Wiltwyck's boys; (2) to set in motion an inquiry which may suggest additional personality variables and to evolve a set of criteria for assessing life adaptation of children after treatment; (3) to accomplish a pilot follow-up study of 25 boys leading to development of a proposal for a larger project designed to test whether predictive criteria checked out in the pilot study are valid over a greater length of time, and whether favorable changes observed in children after treatment still hold after five years; and (4) to begin development of test instruments designed to tap personality variables in question.
Subjects: Children in residential treatment and their families.

BEST COPY AVAILABLE

Methods: Current testing techniques will be adapted, and a beginning made toward development of additional techniques designed to tap the variables in question. Cross-sectional diagnosis using techniques as they are designed and clinical diagnosis will be done at beginning and end of child's stay in treatment. It is proposed that follow-up diagnosis, using a format to be developed, will be done at two and five years after termination of child's and family's treatment, depending on success of effort in pilot project to design a larger project and on the acquisition of funds for that expanded effort.
Duration: June 1964-July 1965 (pilot project).
Investigator(s): Edgar H. Auerswald, M.D., Clinical Director, Wiltwyck School for Boys, Inc., 260 Park Ave. S., New York 10, N. Y.
Cooperating group(s): James M. Wolfe Fund.
Publication: Papers to be published when appropriate.

18-M-32 VALIDATION OF ADULT PREDICTION TABLES ON THE 500 DELINQUENTS OF UNRAVELING JUVENILE DELINQUENCY DURING THE AGE SPAN 21-31

Subjects: 500 delinquents and 500 matched nondelinquents of Unraveling Juvenile Delinquency (Harvard University Press, 1950).
Methods: In follow-up study, tables dealing with prediction of behavior on probation, on suspended sentence, in reformatories, in prisons, in jails, in houses of correction, and on parole have been examined; predicted behavior has been checked with the actual behavior. The method of checking follows the same pattern as that utilized in the checking of series of tables for use by juvenile courts as originally published in volume Juvenile Delinquents Grow Up (The Commonwealth Fund, 1940).
Duration: November 1962-1964.
Investigator(s): Sheldon Glueck, Ph.D., Roscoe Pound Professor of Law, and Eleanor T. Glueck, Ph.D., Research Associate in Criminology, Law School, Harvard University, Cambridge 38, Mass.
Cooperating group(s): Harvard Law School; Ford Foundation; several private foundations.
Publication: Federal Probation, 20:4, December 1956; Essays in Jurisprudence, In Honor of Roscoe Pound, Indianapolis: The Bobbs-Merrill Co., 1962; Criminal Careers in Retrospect, New York: The Commonwealth Fund, 1943; Predicting Delinquency and Crime, Cambridge: Harvard University Press, 1959.

18-M-33 STUDY ON PREDICTION OF RECIDIVISM BY RORSCHACH TEST

Purpose: To attempt to predict, by means of the Rorschach, a second delinquent act before it is committed.
Subjects: 300 children committed to the Nagasaki Juvenile Detention and Classification Home between April 1960 and March 1962 were selected at random. Only mentally defective children were excluded.
Methods: Subjects are divided into a group for whom the prognosis is bad and a group for whom the prognosis is good as determined by Rorschach results. Subjects are followed after release to determine rates of recidivism for the groups.
Duration: April 1960-April 1964.
Investigator(s): Toshiko Tsuchiya, 2-22 Nagahama Town, Fukuoka City, Japan. (Reported by NCCD.)
Cooperating group(s): Nagasaki Juvenile Detention and Classification Home; Nagasaki Family Court.

18-M-34 YOUTH OPPORTUNITIES BOARD OF GREATER LOS ANGELES

Purpose: To demonstrate effectiveness of particular programs or combinations of programs in reducing delinquency and other expressions of youth failure; to demonstrate the operational feasibility of intervention aimed at modifying social situations and structures through which youth failure occurs.
Subjects: Disadvantaged youths to the age of 21 years, living in South Central Demonstration Area.
Methods: A demonstration project characterized by "action-research", involving a close meshing of theory, action, test and redesign. There are currently two Youth Training and Employment Programs in operation, serving 16 to 21 year age group. In addition, there are two programs in the Los Angeles City and County Schools which will be joined in the fall 1964, by several more new programs. These programs, along with those proposed in the fields of corrections, health, mental health, training, community development and recreation, will be evaluated for further planning and generalized application of prototypes of these programs to other communities with severe youth failure problems.
Duration: April 1962-indefinite.
Investigator(s): Alfred P. Parsell, Ph.D., Research Director, Youth Opportunities Board of Greater Los Angeles, 220 North Broadway, Los Angeles 12, Calif.
Cooperating group(s): Welfare Planning Council, Los Angeles Region; System Development Corporation.

18-M-35 EXAMINATION OF ACTIVITIES AND IMPACT OF THE DELINQUENCY PREVENTION BUREAU OF THE CITY OF BOSTON

Methods: Structured reporting forms are employed to obtain data on detached worker's contacts with juveniles over a one-year period. Information on size of group, duration of contact, reason for contact and location of contact has been analyzed. Estimates are made of the delinquency experience based upon police warnings and arrests of boys in contact with detached workers in comparison with a study group of similar age and neighborhood of residence.
Duration: January 1961-June 1963.
Investigator(s): Howard E. Freeman, Ph.D., Associate Professor of Social Research, and Stanton Wheeler, Ph.D., Florence Heller School for Advanced Studies in Social Welfare, Brandeis University, Waltham 54, Mass. (Reported by NCCD.)
Cooperating group(s): Youth Activities Bureau of Boston; Youth Service Board of Commonwealth of Massachusetts.

18-M-36 STAREHE BOYS' CENTRE, NAIROBI

Purpose: An attempt to find an efficient and inexpensive solution to problems of juvenile delinquency and vagrancy in the city of Nairobi. Present research attempts to measure the effects of a therapeutic program on participants' attitudes and behavior.
Subjects: 430 boys, aged 7 to 18 years, of whom 200 are in residential care and 230 attend on a daily basis.
Methods: Establishment of a "climate" conducive to reform, extensive use of peer influences, the alleviation of physical hardship and destitution which are sometimes a factor in delinquency, the provision of occupation including schooling and casework services.
Findings: Preliminary results indicate that less than 6 percent per annum are involved in any further trouble after entry into program.
Duration: June 1959-continuing.
Investigator(s): G. W. Griffin, P. O. Box 30397, Nairobi, Kenya. (Reported by NCCD.)
Cooperating group(s): Child Welfare Society of Kenya; Save the Children Fund,

Kenya Branch; Kenya Shell Oil Company; British Petroleum Company; Nairobi City Council; Government of Kenya; Ford Foundation.

18-M-37 COMMUNITY COSTS OF SERVICED AND UNSERVICED GANGS

Purpose: An attempt to ascertain whether the provision of service to delinquent juvenile gangs by a street worker program reduces total of law enforcement, court, and correctional costs incurred by the community in its interactions with gang members.
Subjects: 76 delinquent gang youth from one of the deprived sectors of central Los Angeles. These youth comprise two groups, one serviced, the other unserviced. The two groups are essentially alike on social and personality characteristics. By what appears primarily chance, one group was chosen as a subject for a delinquency prevention program.
Methods: Rosters of the two groups were obtained during an area survey by the Group Guidance Office of the Los Angeles County Probation Department. Histories of members of both groups are being documented in detail to ascertain all law enforcement contacts, court actions, and correctional services experienced. Actions and services will be translated into economic terms by use of current estimates of unit and monthly costs. Comparisons will be made of average annual expenditures on group members to ascertain the reasons for any apparent differences in correctional costs.
Findings: Prior to introduction of street worker program, the 33 boys in the unserviced gang had cost the community $121,921 in correctional expenditures. The 43 boys in the other gang had cost $166,882. The averages were $3,695 and $3,880 per boy, respectively. Average costs following the introduction of the street worker program remain to be ascertained.
Duration: May-September 1964.
Investigator(s): Roger E. Rice, M.A., Research Analyst, and Stuart Adams, Ph.D., Research Director, Los Angeles County Probation Department, Los Angeles, Calif.
Publication: To be released by the Research Office of the Los Angeles County Probation Department.

18-M-38 DELINQUENCY STUDIES PROGRAM

Purpose: To learn more about variety of official orientations and actions toward juveniles, the bases of these variations, and their consequences for juveniles and their communities. In addition to several theoretical inquiries, field studies will include: (1) an investigation of the relation between police and probation handling of juveniles in two counties; (2) police encounters with juveniles and a longitudinal study of a juvenile cohort from period before their contact with the law; (3) official contacts and careers of members of juvenile gangs; (4) a comparative analysis of decision-making in the juvenile court; (5) study of staff-girl inmate relations in a detention hall; and (6) exploration of treatment programs at a correctional facility for older youths.
Duration: September 1962-August 1965.
Investigator(s): Sheldon L. Messinger, et al., Center for the Study of Law and Society, University of California, Berkeley 4, Calif. (Reported by NCCD.)
Cooperating group(s): University of California, Davis; University of California, Riverside; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-M-39 A STUDY OF TWO POSSIBLE SOURCES OF COMMUNICATIONS BREAKDOWN IN JUVENILE DELINQUENCY WORK

Purpose: To identify semantic differentials involved in breakdown of communications between juvenile delinquents and juvenile court judges, probation workers, and police officers.
Methods: Osgood Semantic Differential Instrument administered to subjects and controls.
Duration: May 1963-continuing.
Investigator(s): George Shapiro, and Nathan G. Mandel, Ph.D., Director of Research, State Department of Corrections, 310 State Office Bldg., St. Paul, Minn. (Reported by NCCD.)
Cooperating group(s): Department of Speech, University of Minnesota; Hennepin County Court Services; Ramsey County Probation Department.

18-M-40 A STUDY OF INDIVIDUALS WHO HAVE BEEN SENTENCED TO PRISON BY THE KALAMAZOO COUNTY CIRCUIT COURT FROM 1958 THROUGH 1962

Purpose: To test certain assumptions about individuals sentenced to prison by the Kalamazoo County Circuit Court. The assumptions are: (1) a large majority of the individuals had a previous juvenile delinquency record; (2) a large majority had a previous juvenile commitment record to a boys training school; and (3) a large majority did not have a high school education.
Subjects: 363 persons sentenced to prison during period 1958 through 1962.
Methods: Statistical analysis of data collected from Kalamazoo County Adult Probation Department, including age, race, education, marital status, employment status, offense, previous record and juvenile record.
Findings: Indications are that the first and second hypotheses are unfounded. The third hypothesis was supported and is assumed valid.
Duration: 1963.
Investigator(s): Harold W. Dyer, Juvenile Officer, Kalamazoo County Juvenile Court, Kalamazoo, Mich. (Reported by NCCD.)
Publication: Six page mimeographed report by investigator, 1963.

18-M-41 ESSEXFIELDS GROUP REHABILITATION CENTER

Purpose: To ascertain the effectiveness of a community based short-term treatment center for adolescent offenders.
Subjects: Boys, 16 and 17 years, residing in Essex County, New Jersey, and adjudicated delinquent by Essex County Juvenile Court.
Methods: Establishment of an experimental and three control groups. A comparison of recidivism and personality profile as measured by MMPI will be made between subjects placed in Essexfields Group Rehabilitation Center, Annandale State Reformatory, New Jersey State Residential Centers, and boys placed on straight probation.
Duration: April 1961-December 1965.
Investigator(s): Albert Elias, M.A., Superintendent, Bordentown State Reformatory, Bordentown, N. J., and Richard Stephenson, Ph.D., Chairman, Department of Sociology, Rutgers, The State University, New Brunswick, N. J. (Reported by Saul Pilnick, Executive Director, Essexfields Group Rehabilitation Center, 180 Clinton Ave., Newark, N. J.)
Cooperating group(s): Essex County Juvenile Court; Essex County Probation Department; New Jersey State Department of Institutions and Agencies; Ford Foundation.
Publication: Monographs, professional papers, and a book are planned.

18-M-42 EVALUATION OF JUVENILE REHABILITATION PROGRAMS

Purpose: To determine effects of juvenile rehabilitation programs upon youngsters committed to the Department of Institutions; to determine means by which existing programs can be improved.
Subjects: Children committed to juvenile rehabilitation facilities of the Department of Institutions.
Methods: (1) Detailed information collected concerning background of juveniles prior to commitment. (2) Psychological and educational achievement tests administered and diagnosis of institutional staff reviewed. (3) Data collected on the services provided by the institutions to each child. (4) Factors listed above correlated with parole behavior of juvenile and significant factors relating to change will be determined.
Duration: October 1963-indefinite.
Investigator(s): Evan A. Iverson, Ph.D., Supervisor, Duane W. Sturges, Research Analyst, and Gloria K. Clemmons, Statistician, Research and Program Analysis Section, Washington State Department of Institutions, Olympia, Wash. (Reported by Sidney Coleman, Supervisor, Division of Administrative Operations, Washington State Department of Institutions.)
Publication: To be published in Research Review, Department of Institutions.

18-M-43 A REFINEMENT IN THE USE OF THE SCHOOL MOTIVATION ANALYSIS TEST (SMAT) AS A PREDICTOR OF SCHOOL ACHIEVEMENT IN DELINQUENT BOYS

Purpose: Earlier work in the prediction of school achievement by Pierson, Barton, and Hey demonstrated that both components of the drive factors on the SMAT (integrated and unintegrated) each yield very high and significant relationships between predicted criteria. This study attempts to correlate both components to obtain an even higher multiple correlation.
Methods: Pearson Product-Moment Coefficients and the Specification Equation. Eleven factors from each component were chosen for inclusion in the new equation.
Findings: A multiple correlation of .92 was obtained, unquestionably the highest which has been reported to date. With the new equation, prediction of academic achievement of delinquent boys is now possible with an unprecedented degree of accuracy.
Duration: October 1963-December 1964.
Investigator(s): George R. Pierson, Ed.D., Chief, Psychological Services, Green Hill School, Washington State Department of Institutions, Chehalis, Wash.
Publication: To be published in Educational and Psychological Measurements in 1964.

18-M-44 THE PREDICTION OF ACHIEVEMENT IN VOCATIONAL TRAINING OF DELINQUENT BOYS

Purpose: To determine best means of predicting aptitude of delinquent boys for training in vocational shops.
Subjects: 56 students assigned to shops in the vocational training program at Green Hill School in 1963.
Methods: Pearson Product-Moment Coefficients were computed between each of the 14 personality factors and instructor's ratings. Tests were administered during boy's first week in institution; ratings were made following boy's departure from institution. Data were prepared for computer analysis.
Findings: A multiple correlation of .65 has been secured (significant at the .01 level) indicating that personality variables play an extremely important role in success in vocational training. Tentative findings seem to indicate that about 42 percent of variance in instructor's ratings are determined by personality factors alone. This, if combined with ability measurements, would lead to extremely high multiple correlations.

Duration: January-March 1964.
Investigator(s): George R. Pierson, Ed.D., Chief, Psychological Services, Green Hill School, Washington State Department of Institutions, Chehalis, Wash.
Publication: An article is planned.

18-M-45 A SELF-INSTRUCTIONAL PROGRAM FOR YOUTHFUL OFFENDERS

Purpose: To develop a low-cost, self-instructional program at Draper Correctional Center that will incorporate all educational, vocational, and rehabilitation training of the prison into its operation; to design, develop, and utilize a self-instructional curriculum more applicable to the educational, occupational, and social needs of youthful offenders in a prison society, both with regard to that society and the one they are preparing to enter outside; to evaluate the program both with respect to performance in prison and following release; and to develop a useful and adequate "blueprint" that can be easily adapted to needs of other institutions.
Duration: May 1962-April 1965.
Investigator(s): John M. McKee, Ph.D., Project Director, and John C. Watkins, Warden, Draper Correctional Center, Elmore, Ala.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-M-46 USE OF PROGRAMMED INSTRUCTION WITH DELINQUENTS: A PILOT STUDY

Purpose: To test the feasibility of using programmed instruction with mentally disturbed, delinquent, or problem children at Minnesota State Training School for Boys Reception Center.
Duration: August 1962-May 1963.
Investigator(s): Gilbert Westreich, Wentworth Quast, Ph.D., Assistant Professor of Psychiatry, Medical School, University of Minnesota, Minneapolis, and Nathan G. Mandel, Ph.D., Director of Research, State Department of Corrections, 310 State Office Bldg., St. Paul, Minn. (Reported by NCCD.)

18-M-47 CHILDREN'S VIEWS OF THE JUVENILE COURT AND ITS AUXILIARY SERVICES

Purpose: To learn children's views of the various policies, practices, and institutions constituting the court process with particular attention to the impact of certain practices of the staff. Included will be such matters as problems of communication, confidentiality of information, fulfillment of expectations transmitted by personnel, sense of fairness or injustice, etc.
Methods: Taped interviews with children, singly or in groups, which will include certain standard areas of inquiry. Responses will be systematized and analyzed, including differentiation made on basis of position of child in the court process. Excerpts from numerous interviews will be logically arranged to illustrate children's view of certain practices.
Duration: July 1963-July 1965.
Investigator(s): Donald T. Anderson, Educational Director, and Robert H. Barstow, Children's Charter of the Juvenile Courts of Michigan, Inc., 703 Westnedge Ave., Kalamazoo, Mich. 49007. (Reported by NCCD.)
Cooperating group(s): Michigan Probate and Juvenile Court Judges Association; Michigan County Juvenile Officers Association; Michigan Juvenile Court Officers Association; Kellogg Foundation.

18-M-48 THE APPLICATION AND SUCCESS OF THE INDETERMINATE PUNISHMENT OF YOUTH IN THE COUNTY COURT DISTRICT OF KLEVE

Purpose: To determine whether there are particular characteristics of offense or offender which predispose the court to a sentence of indeterminate punishment. This will be followed by an investigation into the possibility of setting standards for decisions on the duration of pronounced punishments, and later by an investigation of the amount of recidivism of juveniles sentenced to indeterminate punishment during the time of their parole.
Subjects: 90 juveniles sentenced to indeterminate punishment in the years 1954 to 1961.
Duration: Summer 1962-continuing.
Investigator(s): Klaus Puruckherr and Gerhard Kielwein, Institute of Criminology, University of the Saar, 66 Saarbrucken 15, Stadtwald, Germany. (Reported by NCCD.)

18-M-49 DETERMINATE PUNISHMENT OF YOUTH IN THE SAAR

Purpose: To investigate the applicability and effectiveness of the determinate punishment of youth in the Saar. To find decisive factors for success or recidivism and the prognostic significance of these factors.
Subjects: All male juveniles (N=180) who were dismissed from the Saar Youth Reformatory between 1957 and 1961, after having partially or completely served a determinate sentence.
Methods: Inquiry into personality, environmental circumstances, life history, and various criminogenic factors apparent in these areas of investigation. Manner and method of their criminological activities were also investigated. Further research was done on effects of attempts at re-education undertaken during their sentences, on their conduct during incarceration and after release. Official state, institution, court, and parole records formed the basis for data collection.
Findings: Determinate punishment of youth appears to be successful mainly with those minor violators whose criminality can be traced to detrimental environmental influences or adolescent developmental disturbances. As practiced today, the punishment under investigation appears to be a complete failure with offenders with certain particular psychopathic disturbances. Establishment of the presence or absence of such character anomalies is decisive for prognosis.
Duration: October 1961-spring 1964.
Investigator(s): Richard Bellon and Gerhard Kielwein, Institute of Criminology, University of the Saar, 66 Saarbrucken 15, Stadtwald, Germany. (Reported by NCCD.)

18-M-50 GROUP COUNSELING WITH PROBATIONERS IN THE JUVENILE COURT SETTING

Purpose: (1) To provide juvenile probationers with an opportunity to examine their antisocial behavior with critical judgment, to recognize that their problems are not unique, to share in the free expression of thoughts and feelings, and to participate in the development of solutions to common problems that will prove personally satisfying and socially acceptable; and (2) to provide probation officers in the juvenile court setting with a treatment technique that will facilitate more effective handling of large caseloads than the sole use of individualized casework techniques would permit.
Subjects: First offenders, 15 to 18 years of age, who are not co-delinquents, who have been placed on probation by the court, and whose needs and abilities indicate suitability for treatment in a group setting.
Methods: Program is not designed to provide therapy reaching to a fundamental depth of personality; instead, it deals on a more superficial level in an effort to achieve satisfactory functional adjustment. First program evaluation

is to be made in April 1964.
Duration: April 1963-continuing.
Investigator(s): Frederic L. Faust, ACSW, Director of Court Services, and staff, Franklin County Court of Domestic Relations, 50 East Mound St., Columbus, Ohio 43215. (Reported by NCCD.)

18-M-51 AN EVALUATION OF A JUVENILE COURT RESOURCE UNIT

Purpose: To determine if a resource unit, featuring coordination of independent community agencies, can assist a juvenile court in keeping children referred to it out of further trouble; to determine whether any measurable changes in personality or attitudes can be discovered and related to behavioral changes.
Subjects: First offenders under 14 referred to the Family Court from the Providence area.
Methods: Comparisons will be made between experimental (Resource Unit) and control groups on recidivism data for the year prior to and following adjudication. Comparison of scores on a test battery comprising the Semantic Differential, Self-Concept Scales, Word Association Test, and Children's Manifest Anxiety Scale before adjudication and one year later will also be made.
Duration: September 1963-August 1966.
Investigator(s): Hector Jaso, M.D., Director, and Kennison T. Bosquet, Sc.M., Research Director, Providence Child Guidance Clinic, Providence, R. I.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Results to be published in psychiatric and psychological journals.

18-M-52 GROUP THERAPY PROJECT

Purpose: To test the efficacy of a group psychotherapy program in a juvenile court setting.
Subjects: 12 adolescent delinquent males. Later groups may include females.
Methods: Attendance at group sessions is mandatory by court order. Authority of court is an inherent part of program. An attempt is made to remove therapeutic personnel from as much of the authoritarian aspects of the probation plan as possible in order to develop an atmosphere of trust and understanding. Group is limited to eight members who attend once a week for one hour. As members are discharged, new selections are made.
Duration: July 1962-continuing.
Investigator(s): John J. Mayer, Director of Social Services, Cuyahoga County Juvenile Court, 2163 East 22nd St., Cleveland 15, Ohio. (Reported by NCCD.)

18-M-53 YOUTH STUDIES CENTER-BOYS REPUBLIC HALFWAY HOUSE EXPERIMENT

Purpose: (1) To test series of theoretical assumptions regarding a community versus an institutional approach to change (once having gone through a series of developmental stages in which increasing responsibility is assumed, offenders will be more inclined to have a group and personal investment in supporting law-abiding behavior); (2) to carefully examine the change process itself.
Subjects: Habitual incarcerated delinquents, 15 to 17 years.
Methods: Subjects are randomly selected and removed arbitrarily from an institution to the halfway house approximately one year before ordinary release. Group techniques will be used in establishing a small community of peers who themselves can exert controls over and solve problems for one another.
Duration: February 1964-1967.
Investigator(s): LaMar T. Empey, Ph.D., Director, Youth Studies Center,

University of Southern California, Los Angeles, Calif. 90007.
Cooperating group(s): Boys Republic; Rosenberg Foundation.
Publication: To be published in appropriate journals.

18-M-54 CHILDREN COMMITTED TO STATE TRAINING SCHOOLS BEFORE THEIR TWELFTH BIRTHDAY: AN EVALUATION OF A PROJECT

Purpose: A description and analysis of a program directed toward finding suitable resources for very young children now being sent to Maryland training schools.
Findings: Long-range value is questionable in view of high recidivism, suggesting that the program cannot be effective without more intensive services.
Duration: 1962-December 1963.
Investigator(s): John C. Smedley, ACSW, State Department of Public Welfare, 301 W. Preston St., Baltimore, Md. 21201. (Reported by NCCD.)
Publication: Study of Children Under 12 Years of Age Committed to Training School, Baltimore: Maryland State Department of Public Welfare, 1957 (20 pp., mimeographed).

18-M-55 PEER AND STAFF INFLUENCE ON DELINQUENT GIRLS' ATTITUDES TOWARD AND USE OF A CORRECTIONAL INSTITUTION

Purpose: To determine which persons in an institution for delinquent girls are seen by the girls as having the greatest influence on the development of their attitudes towards staff power.
Subjects: 50 disturbed, delinquent girls, ages 13 to 18, in residential treatment at Los Palmas School for Girls, Los Angeles. Sample included all girls in the Intake (10) and Release Cottages (10), plus 30 girls from three "open campus" cottages.
Methods: Each girl was seen once for a one to one and one-half hour semi-structured interview. Interviews were tape recorded and were conducted over a two and one-half week period.
Duration: September 1962-June 1964.
Investigator(s): Helen Northen, Ph.D., Professor, Rose Green, M.S.S., Lecturer, Sara Maloney, D.S.W., Associate Professor, and Harvey Bertcher, School of Social Work, University of Southern California, Los Angeles, Calif. 90007. (Reported by NCCD.)
Publication: Doctoral thesis submitted to University of Southern California.

18-M-56 STUDY OF INTELLIGENCE, ACHIEVEMENT, AND ADJUSTMENT OF DELINQUENT BOYS IN TRAINING SCHOOL

Purpose: To determine the relationship of intelligence to achievement and adjustment of boys at Eastern Carolina Training School, Rocky Mount, N. C. Specific hypotheses are: (1) that significant relationships exist between intelligence and achievement; and (2) that no significant relationship exists between intelligence and mental health of boys at Eastern Training School.
Subjects: 160 white juvenile males who entered Eastern Carolina Training School between July 1, 1961 and June 30, 1962. Mean age was 14.5 years; mean and median I.Q. was 85.
Methods: WISC intelligence quotients, grade equivalent scores on each of the six subtests of the Standard Achievement Tests, paragraph meaning, word meaning, spelling, language, arithmetic reasoning, arithmetic computation and mental health analysis scores were collected for each subject. Scores were converted to standard scores from which a correlation coefficient was computed between I.Q. and achievement, and I.Q. and mental health analysis. The Pearson

Product Moment Machine Formula was used for finding the correlation coefficients. Findings: Highly significant relationship was found to exist between intelligence and achievement. While the relationship between mental health and intelligence was not found to be as high, it nevertheless was significant (.31). Further implications were: (1) delinquents do better on nonverbal than verbal tests; (2) delinquents do poorly on tests that draw upon knowledge and skills gained from school studies; (3) low intelligence is not as much a factor in delinquency as is a lack of scholastic achievement; and (4) the mental health of the typical delinquent is poor.
Duration: September 1962-May 1963.
Investigator(s): Charles G. Morehead, D.Ed., Professor, Harold M. Corter, Ph.D., Professor of Psychology, Horace S. High, and Roy Nels Anderson, Ph.D., Head, Department of Occupational Information and Guidance, North Carolina State College, Raleigh, N. C. (Reported by NCCD.)

18-M-57 PEER CULTURE AMONG INSTITUTIONALIZED DELINQUENT GIRLS

Purpose: To explore the effects of participation in a peer culture pattern on the part of young, institutionalized delinquent girls at a state training school. Pattern involves the assumption by girls of fantasy familial roles with respect to each other; participation in the inmate culture, while extensive, is by no means universal.
Subjects: Institutionalized delinquent girls, 12 to 17 years of age.
Methods: (1) Participant observation to observe structure of inmate social relationships in which cultural pattern is embedded; (2) development and validation of rating scale procedures for assessment of levels of participation in the culture; (3) a school career study designed to explore relationship between institutional "success" as defined by staff and participation in the culture; and (4) a follow-up study to assess subsequent effects of participation in the pattern on the part of girls returned to the community.
Duration: September 1963-September 1964.
Investigator(s): Romolo Toigo, Ph.D., Bureau of Social Science Research, 1424 16th St., N. W., Washington, D. C.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-M-58 MEASUREMENT OF THE ATHLETIC DEVELOPMENT OF JUVENILES DETAINED IN A JUVENILE DETENTION AND CLASSIFICATION HOME

Purpose: To study the athletic development of juveniles in a detention and classification home in relation to intelligence, personality type, character, delinquency, and as an aid in their diagnosis and treatment.
Findings: Compared with athletic development of junior and senior high school pupils, subjects were inferior in equilibrium and coordination. No significant differences were found between groups in the standing broad jump and ability to learn physical exercises.
Duration: May 1962-not reported.
Investigator(s): Makio Katsurajima, Miyazaki Juvenile Detention and Classification Home, 3-31 Tsurushimacho, Miyazaki-shi, Miyazaki Pref., Japan. (Reported by NCCD.)

18-M-59 ADJUSTMENT TO COLOR IN A JUVENILE DETENTION AND CLASSIFICATION HOME

Purpose: To study effects of room color on male delinquents in reference to color preferences and relation between color preferences and personality.
Subjects: 350 male delinquents.

Methods: Subjects were divided into groups of 50 each and placed in rooms painted in shades varying from weak cool color to strong warm color.
Findings: Color preference in delinquents differs from that of nondelinquents. Delinquents prefer yellow, white, and purple to blue. While those who prefer such warm colors as yellow have low intelligence and antisocial character problems, those who prefer purple and achromatic colors such as black or gray show character problems of a rather neurotic nature. Room which has best effect on delinquents, whatever their preferences, is of a weak cool color; the room in which they can stay without consciousness of color is color-conditioned by mainly warm colors.
Duration: May 1962-December 1963.
Investigator(s): Masaharu Takahashi, 2-136 Nakamachi, Nerima-Ku, Tokyo, Japan. (Reported by NCCD.)
Cooperating group(s): Tokyo Juvenile Detention and Classification Home.
Publication: Studies of Color, Vol. 10, No. 2, 1963, published by Color Research Institute.

18-M-60 TREATMENT OF JUVENILE OFFENDERS IN A JUVENILE CORRECTIONAL INSTITUTION AND ITS RELATIONSHIP TO PREPARATION FOR ADJUSTMENT TO NORMAL LIFE

Purpose: Study is based on material collected between 1954 and 1962 in the reception division of a juvenile institution where treatment methods are not as effective as one could hope. Hypothesis to be tested is that the reason treatment methods are not effective is that prisoners are only conforming to staff expectations and are not actually changed for the better by the treatment methods.
Methods: Annual groups of approximately 1,000 discharged prisoners will be observed longitudinally for a period of five to seven years with respect to recidivism.
Duration: May 1962-continuing.
Investigator(s): Alexander Bohm, M. Neulandt, and Dr. Albert Krebs, Wilhelmstrasse 24, Wiesbaden, Germany. (Reported by NCCD.)
Cooperating group(s): Ministry of Justice of the State of Hessen; Correctional Institution for Juveniles at Rockenberg.

18-M-61 EVALUATION OF THE EFFECT OF CORRECTION

Purpose: To compare the results of psychometric tests taken before the delinquents entered a correctional institution with one taken after they had undergone treatment.
Subjects: 31 boys from the Takamatsu Classification Home.
Methods: Group Rorschach test, modified Harrower's Large Scale, Yatabe-Guilford Personality Inventory, and Sentence Completion Test administered to subjects.
Findings: Test results showed an increase in mental activity and a stabilization of emotion, a decrease in inferiority feelings, and an increase in objectivity. Social adaptation was seen to increase. Feelings of mistrust of adults and neighbors seemed to increase.
Duration: April 1962-April 1964.
Investigator(s): Taneo Ogura, 87-1 Fujizuka-cho, Takamatsu-shi, Kagawa-ken, Japan. (Reported by NCCD.)
Cooperating group(s): Shikoku Reform and Training School; Matsuyama Reform and Training School; Takamatsu Juvenile Detention and Classification Home.

18-M-62 PILOT STUDY: PRISON IBM UNIT AS RESEARCH RESOURCE

Purpose: To exploit punch card information on all prisoners of a statewide prison system as means of drawing a stratified sample on basis of age, race, and recidivism; to evaluate differences between young prisoners and older prisoners in terms of prison behavior as indicated by infractions of prison rules.

Subjects: 490 male felons, ages 14 and above, selected from a universe of 5,700 male felons.

Methods: Stratified sample drawn from total group of felons; schedules were completed by research clerks to obtain more specific data on selected sample from prisoner record jackets.

Findings: Partial: infraction rates are highest for youthful prisoners (ages 14 to 20), and decline with increasing age. As a whole, whites have uniformly higher infraction rates than Negroes for all age groups. However, racial differences are least apparent for ages 14 through 20 and above 30 years. Negro recidivists in the 14 to 20 age range have higher infraction rates than their white counterparts; remarkably high rates are found for fighting and assault and for relatively minor violations of social etiquette. This suggests that young Negro recidivists differ markedly from older Negro recidivists in their deviation from the traditional pattern of conformity among Negro prisoners.

Duration: May 1962-May 1964.

Investigator(s): Elmer H. Johnson, Ph.D., Professor of Sociology, North Carolina State College of the University of North Carolina, Raleigh, N. C.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: Mimeographed report; article for journal publication.

18-M-63 DECISION MAKING IN ALLOCATING JUVENILE PAROLEES TO ALTERNATIVE TREATMENTS

Purpose: An exploratory pilot study to identify relative frequency with which empirically derived attributes are cited as influencing decision to allocate juvenile parolees to intensive casework treatment or regular parolee supervision; to specify, in terms of action decisions, the initial process of parole work; later, to explore extent to which leading identified factors influencing decisions to allocate juvenile parolees to alternative treatments coincide with those regarded as salient by practitioners themselves; finally, to examine relationship between allocation decisions and measures of recidivism.

Methods: A detailed content analysis of allocation decisions reported on an open-ended, standardized form is employed for inducing relative frequency of attributes cited as determining decision. Units of analysis are identifiable attributes of parolees and individual members of their families, including both verified acts, professional judgments, and standardized measurements. Unit of enumeration is a tally of distinct themes (i.e., number of times intelligence is cited as distinct from I.Q. measurements; number of times parent-child interaction is cited as distinct from quality of relationship itself). Second stage of study will employ a questionnaire with items derived from findings of content analysis.

Findings: Present findings indicated in mimeographed Eighth Annual Report of New York State Training Schools for Boys, Home Service Bureau; future progress reports to be included in subsequent annual reports.

Duration: April 1964-1965.

Investigator(s): Staff, New York State Training Schools for Boys, Home Service Bureau, New Hampton; Herman Piven, D.S.W., Associate Professor, and Arden E. Melzer (Doctoral Candidate), Assistant Professor, Graduate School of Social Work, New York University, New York, N. Y.

Cooperating group(s): New York State Department of Social Welfare.

18-M-64 EVALUATION TOOLS AND PROCEDURES: THEIR DEVELOPMENT AND APPLICATION TO THE TRAINING CURRICULA OF PROFESSIONAL SCHOOLS AND YOUTH SERVICE AGENCIES

Purpose: (1) To formulate a number of central issues problematic to probation and parole practice; (2) to identify the diverse solutions being advocated for resolution of these work problems; (3) to construct and employ measuring instruments to assess influence of variant agency structures on practitioner orientation; and (4) to construct and employ measuring instruments to assess impact of training and orientation on their work with delinquent clients.
Subjects: Graduate students in professional schools, casework and criminology teachers, probation and parole practitioners, and delinquent clients, aged 14 to 20.
Methods: Questionnaires and structured interviews.
Duration: June 1962-December 1965.
Investigator(s): Herman Piven, D.S.W., Associate Professor, Abraham Alcabes, and Arden Melzer (Doctoral Candidate), Assistant Professor, Graduate School of Social Work, New York University, New York, N. Y.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Monograph and articles to be published.

18-M-65 THE EFFECTS OF CHLORDIAZEPOXIDE (LIBRIUM) ON ANXIETY AND HOSTILITY LEVELS OF ASOCIAL AND DELINQUENT ADOLESCENTS

Purpose: To study the immediate effect of a small oral dose of chlordiazepoxide (20 mg.) on the anxiety and hostility levels of a group of asocial delinquent boys; to determine electrodermal (GSR) responses in the subjects and their relationship to measures of anxiety.
Subjects: 75 delinquent boys, 16 and 17 years, who were in custody of the Youth Center of the city of Cincinnati.
Methods: Subjects were brought into laboratory situation, told purpose of experiment, and instructed to talk for five minutes into a tape recorder about any subject. One third of the subjects were then administered a placebo, another third no medication, and one third 20 mg. of chlordiazepoxide. Electrodes were connected to each subject's forearm and wrist for electrodermal (GSR) measurements. Spontaneous GSR activity was measured initially; then other GSR measurements were taken. Boys were again instructed to talk for five minutes into a tape recorder about any subject, following which they were administered the IPAT Anxiety Scale. Further electrodermal studies were carried on under a number of conditions, after which subjects gave another five-minute verbal sample.
Findings: A significant decrease was found in anxiety and hostility levels as measured by verbal behavior method of Gottschalk and Gleser; specifically, anxiety and certain hostility scores of subjects showed a decrease in verbal sample given 45 minutes after ingestion of chlordiazepoxide. No significant correlations were found between IPAT anxiety scores and the electrodermal responses, although a low positive correlation was found between verbal behavior anxiety scores and spontaneous (GSR) activity in one group of subjects.
Duration: January 1963-October 1964.
Investigator(s): Louis A. Gottschalk, M.D., Research Professor of Psychiatry, and Goldine C. Gleser, Ph.D., Professor of Psychology, Department of Psychiatry, College of Medicine, University of Cincinnati, Cincinnati, Ohio; and Robert Fox, Ph.D., Assistant Professor of Psychology, Duke University, Durham, N. C.
Cooperating group(s): Foundations Fund for Research in Psychiatry; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be published.

EDUCATIONAL PROCESS

General

18-N-1 CHILD DEVELOPMENT PROJECT

Purpose: To investigate factors associated with changes in school anxiety.
Subjects: Approximately 500 students in grade 4.
Methods: Students are to be followed for two years. A variety of test instruments are to be administered near beginning and end of each school year and between the two school years.
Duration: July 1964-August 1966.
Investigator(s): Beeman N. Phillips, Ed.D., Associate Professor of Educational Psychology, University of Texas, Austin, Tex.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted for journal publication.

18-N-2 VARIABLES RELATED TO OUTCOMES OF TEST INTERPRETATION

Purpose: To test the hypothesis that certain variables influence the outcomes of test interpretations (e.g., accuracy of self-estimates, satisfaction with self-estimates, motivation for test interpretation, father's occupational level, father and mother's educational level).
Subjects: Students in grades 5, 7, 9, and 11 from 5 small school districts.
Methods: Following orientation, students completed a self-rating scale, took a battery of tests, including a mental test and achievement test, and completed a third self-rating. Final follow-up self-ratings were completed by each student two months after his tests were interpreted. Counselor instruction emphasized involving students in test interpretation process, detection of underlying effect, and coping with this.
Findings: Teachers have reasonably accurate estimates of students' test performance. Most of the variables did influence outcomes of test interpretation, especially for students at top and bottom of scales.
Duration: October 1963-September 1964.
Investigator(s): Merle M. Ohlsen, Ph.D., Professor of Educational Psychology, University of Illinois, Urbana, Ill.
Cooperating group(s): Cooperative Research Division, Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Three papers to be published.

18-N-3 EFFECT OF TEST ITEM ARRANGEMENT ON THE PHYSIOLOGICAL AND PSYCHOLOGICAL BEHAVIOR OF PRIMARY SCHOOL CHILDREN

Purpose: To determine if the items of an individually administered standardized test may be arranged in such a manner as to reduce situational anxiety produced in a testing situation.
Subjects: Approximately 160 pupils, between the ages of 6 and 7 years, in the first grade of the Columbia, Missouri public schools.
Methods: Subjects are divided equally into four groups and individually tested four times. For each testing, items will be in a different arrangement (i.e., published order, random-order, absolute order of difficulty within subtests, and a patterned order in which the two easiest items are followed by the hardest

without regard to subtest). I.Q.'s, Galvanic Skin Response, and observations of behavior will be recorded for each testing session. The data yielded will be analyzed for differences and similarities.
Duration: September 1963-September 1964.
Investigator(s): Joseph L. French, Ed.D., Associate Professor of Education, University of Missouri, Columbia, Mo.
Cooperating group(s): Columbia Public Schools; Office of Education, U. S. Department of Health, Education, and Welfare.

18-N-4 A STUDY OF HIGH SCHOOL STUDENT ATTITUDES TOWARD AN UNGRADED SCHOOL PROGRAM CONDUCTED DURING AN ELEVEN-MONTH SCHOOL YEAR

Purpose: To ascertain some of the factors within the school setting, such as program, course work, teachers, peer group relations, etc., contributing to underachievement of high school students who fall at or above the 90th percentile on the SCAT; to assist students in making more efficient use of their academic ability.
Subjects: Matched groups of high school students at Nova High School, Broward County, Florida.
Methods: Matched groups will be subjected to a group psychotherapy-like procedure where initial emphasis will be upon collecting important factors.
Duration: June 1964-1967.
Investigator(s): Bady Quintar, Ph.D., Chief Psychologist, Thomas D. Prutsman, Ph.D., Donald B. Clark, Ph.D., and Alan H. Gregg, Ph.D., Clinical Psychologists, Henderson Clinic, 330 S. Riverland Rd., Ft. Lauderdale, Fla.
Cooperating group(s): Broward County Board of Education.

18-N-5 FAMILY LIFE PROGRAM FOR SCHOOLS

Purpose: To include in curriculum of schools of Cuyahoga County a family life study to orient children on importance of emotions in good health, expecially in children.
Duration: June 1964-not reported.
Investigator(s): William W. Herman, M.D., and Ralph I. Fried, M.D., 14077 Cedar Rd., Cleveland 18, Ohio.
Cooperating group(s): Academy of Medicine, Cuyahoga County.

18-N-6 BEHAVIORAL SCIENCES IN THE PRIMARY GRADES

Purpose: To determine whether psychology, sociology, and anthropology can be taught to primary school children as an added subject matter field in the curriculum.
Subjects: A fourth grade class in a local school.
Methods: Children were taught "behavioral sciences" on a 45 minute per week basis throughout the school year. Classroom situation, as well as their own experiences, were used as a laboratory. Teacher was a mental health consultant to the school. Achievement tests were administered to subjects and same test also given to undergraduate and graduate students of psychology; observers were present.
Findings: Fourth graders were able to learn behavioral science principles and facts, scoring on achievement tests between undergraduate and graduate students; graduate students scored highest. It was requested by children, parents, and administrators that program be continued.
Duration: September 1963-May 1964.
Investigator(s): Sheldon R. Roen, Ph.D., Director of Research, South Shore Mental Health Center, 1120 Hancock St., Quincy, Mass. 02169.
Publication: Article has been submitted for publication.

18-N-7 CREATIVITY AND HIGH SCHOOL CLIMATE

Purpose: To examine creativity and climate in a variety of high school settings; to determine environmental characteristics in schools judged to foster creativity as compared with other schools. Three hypotheses will be tested: (1) schools judged to be "High Creative" will be characterized by factors usually considered conducive to development of creativity; (2) staff of "High Creative" school will tend to be composed of individuals who are flexible, adaptive, and outgoing; and (3) highly creative students in these schools will indicate more positive attitudes towards their schools.

Subjects: Approximately 60 students and 30 staff members in each of four participating high schools. Two schools are designated "High Creative"; the remaining two, designated "Other" schools, are roughly comparable to "High Creative" in many ways.

Methods: Subjects administered High School Characteristics Index and a battery of tests of creativity. Staff will take Inventory of Beliefs. Selected highly creative students from each school will write essays about shape of their education. Methods of instruction will be observed, and school publications and records will be examined.

Duration: December 1963-June 1964.

Investigator(s): William J. Walker (Doctoral Candidate, Syracuse University), Box 662, Mexico, N. Y.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

18-N-8 THE CLASSROOM BEHAVIOR SETTING: ITS NATURE AND RELATION TO STUDENT BEHAVIOR

Purpose: To develop concepts and methods descriptive of structure and content of elementary classroom behavior setting; to demonstrate relation of environmental variation to student behavior variation.

Subjects: Elementary school children and their teachers.

Methods: Content analysis of field observations; use of already obtained specimen records and television tapes.

Duration: February 1963-October 1965.

Investigator(s): Paul V. Gump, Ph.D., Associate Professor of Clinical Psychology, Midwest Psychological Field Station, University of Kansas, Oskaloosa, Kans.

Cooperating group(s): Oskaloosa, Lawrence, and Topeka Public Schools; Education Research Project, Wayne State University; Social Psychology Laboratory, University of Missouri; Office of Education, U. S. Department of Health, Education, and Welfare.

18-N-9 TEACHER-CHILD INTERACTION: A STUDY OF THE RELATIONSHIP BETWEEN CHILD-INITIATED QUESTIONS AND NURSERY SCHOOL TEACHER BEHAVIORS

Purpose: To examine systematically the dynamics of relationships between acts of teaching and discernible effects on the learner's behavior in episodes created by the child posing a question to his teacher.

Subjects: 46 children, ages 4 to 5, and their nursery school teachers.

Methods: Timed observations of individual children on rotating schedule permitting distribution of episodes of teacher-child interaction in three segments of nursery school program. Each unit of interaction consists of child's question, teacher's act of teaching, and child's response to the act of teaching.

Duration: September 1963-September 1965.

Investigator(s): Dorothy Haupt (Ed.D. Candidate, Wayne State University), Merrill-Palmer Nursery School, and Frank J. Estvan, Ph.D., Professor of Education, Wayne State University, Detroit, Mich.

Publication: Dissertation to be available in Wayne State University Library.

18-N-10 DIAGNOSTIC STUDY OF EDUCATIONAL AND ATTITUDE CHANGES IN WHITE PLAINS PUBLIC SCHOOL STUDENTS

Purpose: To identify conditions under which a program of school desegregation can best be articulated with a program of continuous educational development.
Subjects: All White Plains public school students in grades 3 through 6.
Methods: I.Q., achievement, creativity, and attitude tests for first year.
Duration: June 1964-indefinite.
Investigator(s): Robert A. Dentler, Ph.D., Executive Officer, and Bernard Mackler, Ph.D., Research Associate, Institute of Urban Studies, Teachers College, Columbia University, New York 27, N. Y.
Cooperating group(s): White Plains Schools; New World Foundation.

18-N-11 DESEGREGATING THE PUBLIC SCHOOLS OF NEW YORK CITY

Purpose: To assist State Education Commissioner's Advisory Committee on Human Relations and Community Tensions; to create a factual base on which to evaluate nature and extent of public school segregation in New York City.
Methods: Sociological and demographic analysis of racial composition of all public schools in New York City.
Duration: March-May 1964.
Investigator(s): Robert A. Dentler, Ph.D., Executive Officer, and Richard A. Boardman, M.A., Research Assistant, Institute of Urban Studies, Teachers College, Columbia University, New York 27, N. Y.
Cooperating group(s): New York City Board of Education; New York State Education Department.
Publication: Data book on New York City Public Schools: *Ethnic Composition and Change* (limited edition); *Desegregating the Public Schools of New York City*.

18-N-12 FACTORS IN THE EDUCATIONAL PLANS AND CAREER ASPIRATIONS OF TWELFTH GRADE STUDENTS IN SELECTED LOW INCOME RURAL COUNTIES IN FLORIDA

Purpose: To determine the social, personal, and family background factors associated with educational and occupational plans and aspirations of twelfth grade students in three low income rural counties in north and northwest Florida.
Methods: In the winter of 1961, high school seniors and a parent of each were interviewed to obtain information on student and family characteristics, and on educational and vocational aspirations. Data were obtained on students' knowledge of available occupational alternatives and his conception of the requirements for these occupations. Data were supplemented by high school records of aptitudes and scholastic achievement. A follow-up study conducted in 1962 determined the actual occupational, educational, and residential status of the subjects.
Duration: 1961-June 1963.
Investigator(s): Margaret J. Hagood, Head, Division of Farm Population and Rural Life, Bureau of Agricultural Economics, U. S. Department of Agriculture, Washington, D. C., and E. Grant Youmans, Ph.D., Department of Rural Sociology, University of Kentucky, Lexington, Ky.
Cooperating group(s): Florida Agricultural Experiment Station; Florida State Employment Service; Florida State Department of Education; University of Florida; U. S. Department of Agriculture.

18-N-13 ANALYSIS OF THE EXTENT AND CHARACTER OF PARTICIPATION OF FARM YOUTH IN HIGHER EDUCATION

Purpose: To appraise the comparative participation of farm youths in higher

education, the relative adequacy of their college preparation, their career aspirations, particularly with reference to technical and professional fields, and the socio-economic factors that influence the extent and effectiveness of their participation in higher education.
Methods: Analysis of Bureau of the Census Current Population Survey, May and October 1959, to reach some estimates of rural youth participation in higher education and gain insights into factors related to urban-rural differences in higher education participation. In addition, any or all of the following methods will be used: (1) analysis of some state university records to compare socio-economic characteristics, high school preparation and qualifications, academic standing, occupational experience, etc. for both rural and urban students; (2) interview freshman and senior class samples in state universities to learn about curricula, occupational plans and aspirations, academic preparation, family characteristics, home residence, etc.; (3) conduct local rural surveys of recent high school graduates to learn the proportions of high school students qualified and the proportion who actually attended college, and reasons for nonattendance.
Duration: 1959-April 1964.
Investigator(s): Louis J. Ducoff, Ph.D., Chief, Farm Population and Rural Life Branch, Economic Research Service, U. S. Department of Agriculture, Washington, D. C.
Cooperating group(s): National Science Foundation; Census Bureau, U. S. Department of Commerce; U. S. Department of Health, Education, and Welfare.

18-N-14 EDUCATIONAL AND VOCATIONAL GOALS OF RURAL AND URBAN YOUTHS

Purpose: To determine and compare educational and vocational goals of rural and urban youth with goals parents have for them; to determine interrelationships, similarities, and differences in goals according to sex, level of living, rural-urban background, and family size for each of the seven contributing States.
Subjects: 144 youths and their parents in each participating State. Selection of sample is based on criteria of urban residence in the same dwelling as parent, and enrollment in grade 9 or 10 of schools in cities of 40,000 or more population.
Methods: Schools in cities meeting population requirement will be selected at random. Three questionnaires, similar to those used in the rural study (Bulletin 15, Research Relating to Children), will be used in addition to a level of living scale suitable for urban populations. Boys and girls will be interviewed at school, while parents will be interviewed either in groups or in their homes.
Duration: June 1964-June 1967.
Investigator(s): Irwin V. Sperry, Ph.D., Head, Institute for Child and Family Development, Women's College, University of North Carolina, Greensboro, N. C.; Virle Payne, M.S., Department of Home Economics, Virginia Polytechnic Institute, Blacksburg, Va.; and Betty Jeffrey, M.S., Assistant Professor of Child Development and Family Relationships, College of Home Economics, University of Tennessee, Knoxville, Tenn.
Cooperating group(s): CSRS, Hatch.
Publication: State data to be published by the Experiment Stations of each contributing State. Data for the regional seven State area to be published in bulletin compiled by one of participating State Experiment Stations.

18-N-15 CHARACTERISTICS OF HIGH SCHOOL SENIORS AS RELATED TO SUBSEQUENT COLLEGE ATTENDANCE

Purpose: To examine nature and extent of talent loss in West Virginia; to study relationship of college attendance in region to scholastic aptitude,

BEST COPY AVAILABLE

general and academic self-concept, achievement motivation, academic achievement motivation, college image, and socio-economic-cultural background factors of graduating high school seniors; to explore interrelationships among these variables.
Subjects: A sample of 1400 West Virginia high school seniors will be selected, with a 30 percent validation sample retained.
Methods: Pilot study will check adequacy of adapted instruments. In main study, sample will be tested with: (1) McClelland's measure of need achievement and a measure of academic achievement motivation; (2) Brookover's general and academic self-concept measures; (3) College Image Inventory; and (4) a socio-economic-cultural background inventory, SCAT scores will also be obtained. A follow-up will classify sample into three groups -- those who: (1) did not attend college the year following graduation; (2) attended college the year following graduation but withdrew by end of the first year; and (3) enrolled and remained in college through beginning of first semester of second year.
Duration: September 1963-June 1966.
Investigator(s): Dr. Benjamin H. Bailey, College of Education, and staff, West Virginia University, Morgantown, W. Va.
Cooperating group(s): Office of Education, U. S. Department of Health, Education and Welfare.

18-N-16 OPPORTUNITIES AND REQUIREMENTS FOR INITIAL EMPLOYMENT OF HIGH SCHOOL GRADUATES AND DROPOUTS WITH EMPHASIS ON OFFICE AND RETAIL JOBS

Purpose: (1) To obtain information about skills required for various entry jobs and availability of these jobs; (2) to determine relationship between high school education and present occupation of high school graduates and dropouts from office and retailing curricula; and (3) to develop a research methodology formulating indexes which reflect changes in entry-job requirements and opportunities.
Subjects: Employers in Detroit and youths, 16 to 22 who graduated from a Detroit high school in June 1963, or should have graduated but dropped out prior to graduation.
Methods: Structured personal interviews with approximately 500 employers and 200 graduates and dropouts at three intervals: July 1964, January 1965, and July 1965. Data from each round of interviews to be processed separately and together to establish trends in the employment of such young persons without prior work experience on a related job.
Duration: January 1964-December 1965.
Investigator(s): Fred S. Cook, Ph.D., Chairman, Business Education, and Frances R. Cousens, Ph.D., Research Associate, College of Education, Wayne State University, Detroit 2, Mich.
Cooperating group(s): Detroit Public Schools; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Report to be published by Dr. Cook and by the Office of Education.

18-N-17 SCHOOL SOCIAL WORK IMPACT ON ACHIEVEMENT AND BEHAVIOR

Purpose: To demonstrate the impact of school social work services on academic achievement and incidences of undesirable classroom behavior in selected grades in two elementary schools; to analyze the kinds of problems children present in elementary grades and nature of problems responding best to full-time and limited school social work service.
Methods: Children will be identified as presenting academic achievement problems and undesirable classroom behavior through use of Pupil Adjustment Inventory, Metropolitan Achievement Tests, California Test of Mental Maturity, and other school records.

Duration: 1963-1967.
Investigator(s): Providence Velasco, M.A., Director, Pupil Personnel Department, and staff, Hillsborough County Public Schools, 1105 Bermuda Blvd., Tampa, Fla. 33605.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-N-18 MIDWEST REGIONAL CENTER FOR PUPIL PERSONNEL SERVICES

Purpose: To study professional role, function, and training of various pupil personnel workers in public schools.
Subjects: School administrators, teachers, special service workers, and perhaps, children.
Methods: Survey and interview studies of staffing patterns, training standards, etc., for pupil personnel workers, and an evaluation of their eventual impact on children.
Duration: August 1963-November 1967.
Investigator(s): Richard L. Cutler, Ph.D., Professor of Psychology, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Interprofessional Research Commission on Pupil Personnel Services; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Series of publications planned.

18-N-19 RESEARCH AND DEMONSTRATION IN PUPIL PERSONNEL SERVICES

Purpose: Primary prevention of learning disabilities and better utilization of pupil personnel services.
Subjects: Elementary and secondary students, their teachers, and pupil personnel workers in a number of school systems throughout the country.
Methods: The central staff conducts nationwide surveys relevant to functioning of pupil personnel workers in various types of schools. Regional centers at Universities of Maryland, Michigan, Texas, and California (Los Angeles) work directly with area school systems in an attempt to evaluate specific programs of pupil services. Outcomes are measured through observation and testing of teachers, parents, and children.
Duration: November 1962-October 1967.
Investigator(s): Walter B. Waetjen, Ed.D., Director, Bureau of Educational Research and Field Services, University of Maryland, College Park, Md. (Reported by Gordon P. Liddle, Ph.D., Associate Director, Interprofessional Research Commission on Pupil Personnel Services, University of Maryland.)
Cooperating group(s): Interprofessional Research Commission on Pupil Personnel Services; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-N-20 A STUDY OF CASES REOPENED FOR ADDITIONAL SERVICE IN THE DIVISION OF SPECIAL SERVICES FOR PUPILS

Purpose: To attempt to discover cause(s) for reopening of cases previously closed as satisfactorily adjusted.
Subjects: Pupils in Baltimore City Public Schools previously served by Division of Special Services for Pupils. A random sample of 100 reopened cases has been studied to determine relationships with various criteria. To extend study, a larger sample of another year's work will be drawn.
Methods: Correlations, tests of significance and other statistical devices to determine relationships and differences.

Findings: Of few trends revealed thus far, one example is significant differences between cases reopened because of attendance and those reopened because of acting-out behavior. This difference was most marked in area of intelligence, acting-out children being significantly brighter than truants.
Duration: November 1962-July 1965.
Investigator(s): Arthur Lichtenstein, Ph.D., Director, Division of Special Services, Marjorie Everinghim, M.S.W., Specialist in School Social Work, and Ralph Valeri, M.A., Clinical Psychologist, Baltimore City Public Schools, Calvert and 23rd Sts., Baltimore 18, Md.

Achievement, aptitude, and school adjustment

18-0-1 A STUDY OF THE RELATIONSHIPS OF INTELLIGENCE, ACHIEVEMENT, CREATIVITY, ANXIETY, AND CONFIDENCE AMONG INTERMEDIATE GRADE PUPILS IN A SUBURBAN AREA ELEMENTARY SCHOOL

Purpose: To add to the data relative to functioning of intellective factors as they might be affected by anxiety and/or more positive emotions.
Subjects: 216 pupils in grades 4, 5, and 6 in Radnor Township School System, Radnor, Pennsylvania.
Methods: Measurements were taken through use of the following instruments: (1) California Test of Mental Maturity; (2) California Achievement Tests; (3) Sarason's Test Anxiety Scale for Children; (4) Operational Confidence Scale; and (5) Minnesota Tests of Creative Thinking. Data were processed and studied through use of correlations, "matched group norms," means and standard deviations, criterion groups, and a limited number of case studies.
Findings: Correlations were positive between verbal creativity, intelligence, and achievement. Correlations between anxiety and achievement were high and negative for boys although more girls appeared to be anxious. Anxiety apparently did not inhibit performance on creative tests for many children.
Duration: September 1963-May 1964.
Investigator(s): Gertrude Gantz Bish (Ed.D. Candidate), Principal, Potomac Junior/Senior High School, Rockville, Md.
Publication: Available in George Washington University Library.

18-0-2 DESCRIPTIVE, NORMATIVE, AND PREDICTIVE STUDIES OF MINNEAPOLIS VOCATIONAL HIGH SCHOOL STUDENTS

Purpose: To help in counseling present and prospective students for vocational high school.
Subjects: Vocational high school students.
Methods: For comparison of dropouts and graduates in Part I of study, intelligence tests, occupational interest tests, and work in various courses, as well as such background material as occupation of father, junior high school attended, absence record in junior high, and personality ratings by teachers were used. High school achievement was measured by courses in English, technical, and related subjects.
Findings: The graduate is more likely to come from a normal family background and from schools away from downtown area, to have entered the tenth grade at an earlier age, to have a better attendance record, to be better liked by his classmates, to be more reliable, to have more initiative, and to be of slightly higher tested intelligence. From the first semester the graduate does better work in English, related courses, and shop courses. The graduate does not differ from the dropout in occupation of father, sex, and eighth grade achievement in reading and arithmetic tests.
Duration: 1958-1966.

Investigator(s): Ralph Johnson, Ph.D., Consultant in Counseling, and Isabel Berman, Ph.D., Psychologist, Minneapolis Board of Education, 807 N.E. Broadway, Minneapolis, Minn.
Publication: Information concerning publication plans may be obtained from principal investigator.

18-0-3 STUDY OF ACADEMIC PREDICTION AND GROWTH

Purpose: To help identify: (1) various growth patterns of students; (2) factors leading to accelerated or retarded growth; (3) whether academic achievement and aptitude become more variable as students mature; (4) effect of interaction of home background and aptitude; (5) differences which may exist in academic growth of boys versus that of girls; and (6) time at which academic aptitude or maladjustment can be detected.
Subjects: 40,000 students in grades 5, 7, 9, and 11 at time of initial testing, in 26 public and 6 private schools throughout the country.
Methods: Each student was tested in 1961 and retested every two years and in spring of his senior year. Sequential Tests of Educational Progress, School and College Ability Tests, Test of General Information, and Background and Experience Questionnaire were used in alternate year fall administrations, and CEEB American History and English Composition Achievement Tests as well as SAT or PSAT are administered in the senior year. The BEQ and TGI were developed especially for program. School visits are made when possible and a questionnaire is filled out by each principal on his school and community the school serves.
Findings: Preliminary data on twelfth grade prediction study are available; a progress report is in preparation.
Duration: September 1961-June 1968.
Investigator(s): Thomas L. Hilton, Ph.D., Research Psychologist, Developmental Research Division, Educational Testing Service, Princeton, N. J.
Cooperating group(s): College Entrance Examination Board.
Publication: Journal of Teacher Education 14:2, June 1963.

18-0-4 STUDY OF ACHIEVEMENT

Purpose: To study effectiveness of the Junior Kindergarten program in Toronto; to examine the learning process and progress in achievement; and to identify factors contributing to success and failure in school.
Subjects: 1,486 children entering Junior Kindergarten in 1960; 7,209 children entering Senior Kindergarten in 1961. To date, attrition has accounted for loss of approximately 25 percent of initial sample. Subjects leaving study are not replaced.
Methods: Longitudinal investigation covering at least first six years of school. Data collection techniques include: (1) Draw-a-Classroom Test; (2) rating questionnaire covering categories of language, mental, social, emotional, and physical "achievement"; (3) Metropolitan Achievement Test; (4) Otis I.Q.; and (5) test of creativity (modification of Circles Test).
Duration: Fall 1960-indefinite.
Investigator(s): A. R. MacKinnon, Ph.D., Director of Research, E. N. Wright, Ed.D., Research Associate, and D. C. Hambleton, Ed.D., Research Associate, Toronto Board of Education, Toronto, Ont.
Publication: Reports will be available from Research Department, Toronto Board of Education.

18-0-5 CHILDREN'S GOALS, ACHIEVEMENT, AND PERFORMANCE IN ELEMENTARY SCHOOLS

Purpose: To investigate the relationship between goal-setting behavior of school children and parents' attitudes regarding school aspiration and performance.
Subjects: Children, aged 9 to 12 years, to be selected on basis of school achievement, socio-economic class, and intellectual ability.
Methods: A factorial design is to be used in which subjects will be ordered on basis of variables. Scores on level of aspiration tasks, as well as methods of parental reinforcement, are to be related. With each parent and each child, individual interviews designed specifically for the project will be conducted, covering those areas relating to academic aspiration and performance; in addition, parent interviews will assess parents' attitudes toward their child concerning school behavior in general and toward their own academic successes and failures. Interviews will be recorded and rated by judges. All children will be individually administered a level of aspiration test and a reading and arithmetic test which will measure level of aspiration in these two areas.
Duration: 1964-1967.
Investigator(s): Erwin J. Lotsof, Ph.D., and William H. James, Ph.D., Associate Professors of Psychology, Northern Illinois University, DeKalb, Ill.
Cooperating group(s): Office of Education, U. S. Department of Health, Education and Welfare.

18-0-6 THE SUCCESSFUL URBAN SLUM CHILD: A PSYCHOLOGICAL STUDY OF PERSONALITY AND ACADEMIC SUCCESS IN DEPRIVED CHILDREN

Purpose: To discover the social and psychological factors that produce the good student; to compare relatively successful pupils from depressed urban neighborhoods with average and failing ones.
Subjects: Elementary school children, primarily in grades 2-3, their teachers, peers, and parents.
Methods: Observation, interview, and psychological tests.
Duration: June 1964-May 1965.
Investigator(s): Bernard Mackler, Ph.D., Assistant Professor, and Thelma Catalano, M.A., Research Assistant, Institute of Urban Studies, Teachers College, Columbia University, New York 27, N. Y. (Reported by Robert A. Dentler, Ph.D., Executive Officer, Institute of Urban Studies.)
Cooperating group(s): Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: To be published in psychological journals.

18-0-7 THE INFLUENCE OF PUPIL TURNOVER AND MOVEMENT ON SCHOOL PERFORMANCE

Purpose: To study school performance of inner-city school children who move a great deal; to study effect of turnover on academic performance, conduct, attitudes toward school, and on teacher morale.
Subjects: Lower class, urban elementary school children.
Methods: Records, interviews.
Findings: Mobility is very high--51 percent turnover in one school year. High mobility is associated with poorer grades; effect is strongest in girls in upper grades.
Duration: January 1963-continuing.
Investigator(s): Murray Levine, Ph.D., Associate Professor of Psychology, Yale University, New Haven, Conn.
Publication: Mimeographed report available.

18-0-8 EFFECT OF EXTRINSIC AND INTRINSIC MOTIVATION UPON THE GENERATION OF REACTIVE INHIBITION

Purpose: Previous studies have used an inverted number printing task to show that poor performers in reading, spelling, and handwriting generate reactive inhibition more rapidly than good performers. But the inverted number printing task appears to be inappropriate as a measure of reactive inhibition in the area of arithmetic, for it appears that good performers are intrinsically highly motivated to produce digits. The present study will attempt to determine whether extrinsic motivation will tend to have as much effect as intrinsic.
Subjects: 60 children in grades 4, 5, and 6 with average I.Q.s, chosen on basis of good or poor performance in spelling. Equal numbers of good and poor performers at each grade level were studied.
Methods: Good performers in spelling were given "extrinsic" motivation in an attempt to determine whether their performance would be similar to that of good performers in arithmetic, who were assumed to be intrinsically motivated. Whereas earlier Ss had simply been told that their cooperation would be appreciated, good performers were told that their performance would show how intelligent they were. Poor performers received the usual instructions. Performance of present Ss was then compared to that of good and poor performers in arithmetic and in spelling when the "unmotivating" instructions were used.
Findings: With extrinsic motivation, performance of good spellers was more like performance of good performers in arithmetic than the "unmotivated" good performers in spelling. It appears that extrinsic as well as intrinsic motivation will enhance digit production. It seems clear, too, that the notion that superior performance of good performers in arithmetic was due to intrinsic motivation was sound.
Duration: March-December 1964.
Investigator(s): Wayne Otto, Ph.D., Associate Professor, College of Education, University of Georgia, Athens, Ga.
Publication: Present plan is to report this as a Paper to be presented at annual American Educational Research Association meeting in Chicago, February 1965.

18-0-9 THE RELATIONSHIP OF LATERALITY AND SCHOOL ACHIEVEMENT

Purpose: To determine degree to which "mixed" and "strong" laterality relate to school achievement.
Subjects: Approximately 600 children in grades 4, 5, and 6 of "middle class" schools.
Methods: 12 tests of laterality administered: 4 handedness, 4 eyedness, 4 footedness; index of laterality calculated; coefficients of index and achievement scores obtained.
Duration: Fall 1963-summer 1964.
Investigator(s): Patrick J. Groff, Ed.D., Professor of Education, San Diego State College, San Diego, Calif.
Cooperating group(s): San Diego Foundation.
Publication: To be submitted to an education journal.

18-0-10 GENERAL RELATIONS BETWEEN CHANGES IN PERSONALITY AND INTERESTS, AND CHANGES IN SCHOOL PERFORMANCE AMONG NORMAL CHILDREN

Purpose: To measure personality and interest-motivation in children on two occasions a year apart; to establish norms of change and to correlate these changes with changes in school performance.
Methods: Questionnaire measures of best replicated factors in personalities of children, 11 to 15 years of age; objective (i.e., indirect) measures of interest-motivation factors; school records of grades and achievement tests. Correlational techniques of analysis employed.

Duration: September 1961-August 1964.
Investigator(s): Raymond B. Cattell, Ph.D., Research Professor, Laboratory of Personality Assessment and Group Behavior, Department of Psychology, University of Illinois, Urbana, Ill.
Cooperating group(s): Gilman, Kankakee, Danville, and Mattoon public school systems.
Publication: Laboratory report.

18-0-11 THE DEVELOPMENT OF THE BRAIN-DAMAGED CHILD PLACED IN REGULAR CLASS

Purpose: To scrutinize what happens to the brain-damaged child in a regular classroom setting.
Subjects: Brain-damaged children presently enrolled in the P.K. Yonge Laboratory School, studied longitudinally. Initial group will be those demonstrating hyperkinesis who have been identified by the classroom teachers through the use of a behavioral data sheet and through personal interviews with the teachers.
Methods: Subjects will be studied throughout their school careers and after by follow-up studies. Following subject identification, psychologists will administer tests to elicit or establish the presence of brain damage. In addition, each child will be clinically interviewed by two child psychiatrists to determine their psychiatric status; children will be followed by psychiatrists and psychologists at six-month intervals. At the same time, members of the College of Education research team will be studying selected students' teachers for general personality characteristics, approach to teaching, degree of directiveness or permissiveness, etc. in order to identify what classroom elements may be significant in the successful or unsuccessful education of the brain-damaged child.
Duration: January 1964-indefinite.
Investigator(s): Frank Carrera, III, M.D., Fellow in Child Psychiatry, Paul L. Adams, M.D., Assistant Professor of Child Psychiatry, Gerald S. Hasterok, Ph.D., Assistant Professor of Personnel Services, and J. B. Hodges, Ph.D., Director, P.K. Yonge School, University of Florida, Gainesville, Fla.

18-0-12 RESEARCH ON THE PREDICTION OF SCHOOL DROPOUTS

Purpose: To attempt to assess student attitudes towards school in the hope of developing materials useful in the prediction of school dropouts.
Subjects: Students in the freshman class of one private boys' high school.
Methods: Analysis of ego involvement; recognition of school colors; evaluation of own school in comparison with other schools; and role expectations in school milieu. Analysis was also made of membership formation of groups to which subjects belonged.
Findings: Evaluation of membership of upper group by its own members was higher than one would expect. Evaluation of members of lower group by themselves was lower. Group interaction was always present in upper and lower groups; middle group divided itself into two parts and interacted with upper group and lower group respectively. A high correlation was found between attitudes and stability of emotions.
Duration: May 1962-February 1963.
Investigator(s): Tsutomu Nozaka and staff, Juvenile Section of M. P. D., 2-Ichome, Kasumigaseki, Chiyodaku, Tokyo, Japan. (Reported in *Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency*, Winter 1963-1964.)

18-O-13 VALIDATION OF THE SCHOOL INTEREST INVENTORY ON SCHOOL DROPOUTS AND SEX DIFFERENCES IN THE UPPER SIX GRADES

Purpose: To secure national validation of dropout and linguistic-nonlinguistic scales developed in the Kansas City area.
Subjects: 20,000 junior high school pupils.
Methods: Administer inventory; contrast responses of school dropouts to matched students remaining in school to determine differentiating items; construct scale keyed to dropout responses. Same procedure will be used for linguistic-nonlinguistic scale to predict dropout potential.
Investigator(s): William C. Cottle, Ed.D., Professor of Education and Director, Counselor of Education and Counseling Psychology Program, School of Education, Boston College, Chestnut Hill 67, Mass.
Cooperating group(s): Houghton Mifflin Company.

18-O-14 DROPOUT STUDY ON TEN LOS ANGELES SCHOOLS

Purpose: To determine what happens to dropouts; to ascertain socio-economic factors of the population from which dropouts are drawn and mobility and attrition rates; to arrive at a precise definition of "dropouts."
Methods: Three year study based on interviews and mailed questionnaire.
Duration: January 1963-June 1965.
Investigator(s): Arthur J. Rowe, M.S., Head of Research and Statistics, Committee on Youth Employment Services, Federation of Coordinating Councils, Los Angeles County Department of Community Services, Los Angeles, Calif.
Publication: Report issued by Los Angeles Department of Community Services available upon request.

18-O-15 SCHOOL DROPOUTS

Purpose: To evaluate programs designed to reduce school dropouts in communities in Maine; to obtain information about promising practices in other States; to develop guidelines for local school departments or service clubs interested in planning community activities to reduce number of dropouts.
Methods: Questionnaire to superintendents of schools; visitation of systems where practices seem promising.
Duration: October 1963-February 1964.
Investigator(s): Philip A. Annas, Ed.M., Executive Director, Division of Instruction, and Henry G. Perkins, Ed.M., (Formerly) Superintendent of Schools, Maine State Department of Education, Augusta, Me.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Helping Youth Pursue Opportunities-Guidelines for the Prevention of School Dropouts, Augusta: State of Maine, Department of Education, 1964.

18-O-16 A STUDY OF THE RELATIONSHIP BETWEEN COUNSELING PARTICIPATION AND INCIDENCE OF DROPOUT AMONG A GROUP OF COLLEGE FRESHMEN

Purpose: To isolate personality factors typical of dropout-type students (personality factors will relate to early development); to determine whether relationship exists between extent of counseling participation and incidence of dropout.
Subjects: 2 matched groups, dropout and non-dropout, each comprised of approximately 30 college freshmen.
Methods: Students are given a routine battery of personality tests upon admission. They also receive individual counseling sessions to the extent

that they request and feel the need for them. Individuals in the two groups are evaluated and compared in terms of nature and intensity that various personality variables and counseling participation is manifested.
Duration: June-September 1964.
Investigator(s): Robert G. Milligan, Ph.D., Director, Testing and Counseling Center, University of San Francisco, San Francisco, Calif.
Cooperating group(s): University of San Francisco Faculty Research Committee.

18-0-17 THE WORLD OF WORK

Purpose: To carry out analyses of students who dropped out of Syracuse schools in 1959-60; to depict characteristics of dropouts who return to school; and to study relation of ecological to other factors.
Methods: Interviews with dropouts; analysis of family and employment status two years after leaving school; new analyses of census and other data on dropouts; examination of long-term employment changes and their possible effects on low-income families; and study of programs aimed at affecting the occupational outlook and prospects of youth.
Duration: September 1962-September 1963.
Investigator(s): Seymour M. Miller, Ph.D., Professor of Sociology, Youth Development Center, Syracuse University, Syracuse 10, N. Y.
Cooperating group(s): Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-0-18 FOLLOW-UP STUDIES OF DATA GATHERED AND PREPARATION OF MATERIALS FOR DISSEMINATION OF FINDINGS FROM THE HUMAN TALENT RESEARCH PROGRAM

Purpose: To further clarify extent and nature of "years of transformation" encountered by children moving through junior high schools and entering senior high schools in four communities (1957-1961); to develop materials and work out means of effective dissemination of findings to school and community agency personnel; to test aspects of a context model of human behavior which employs catalytic variables to explain changes over time; to explore part played by intervention as catalytic element necessary to induce changes as a consequence of various modes of dissemination.
Subjects: Children, grades 7 to 12, in 4 Texas communities; school personnel, prospective teachers, and graduate students working with investigator and staff in dissemination phase.
Methods: Pertinent data have been gathered in Human Talent Research Program; further analyses to be carried on by means of new applied multiple regression techniques corresponding closely to theoretical model. Several kinds of inservice education and internships, as well as new means of communication, will be studied as modes of dissemination.
Findings: Findings thus far available in widely disseminated project reports, chapters in books, journal articles, and duplicated materials.
Investigator(s): Carson McGuire, Ph.D., Professor of Educational Psychology and Director, Laboratory of Human Behavior, College of Education, University of Texas, Austin, Tex.
Cooperating group(s): Hogg Foundation for Mental Health; Department of Educational Psychology, and Extension and Field Service Bureau, University of Texas.
Publication: Reports on later phases of Cooperative Research Projects to appear as Cooperative Research Branch reports (Office of Education, U. S. Department of Health, Education, and Welfare) entitled "The Years of Transformation" and "The Assessment of Talented Behavior," 1964; duplicated materials and reprints to be available from Laboratory of Human Behavior in so far as funds permit; dissemination materials may be available from Hogg Foundation for Mental Health toward close of project.

18-O-19 IDENTIFICATION, DEVELOPMENT, AND UTILIZATION OF HUMAN TALENTS

Purpose: To take an inventory of human resources -- the aptitudes and abilities of high school students in all parts of the country; to establish a set of standards for educational and psychological measurement; to develop a comprehensive counseling guide indicating patterns of aptitude and ability which are predictive of success in various careers; to gain a better understanding of how young people choose their life work, and of the educational experiences which prepare students for their future.

Methods: Best known procedures for aptitude, achievement, information, and personality testing.

Duration: 1959-1983.

Investigator(s): John C. Flanagan, Ph.D., President, American Institute for Research, 413 Morewood Ave., and Professor of Education, University of Pittsburgh, Pittsburgh, Pa.

Cooperating group(s): Office of Naval Research, Department of the Navy; National Science Foundation; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: Findings of Project TALENT are summarized in a series of reports: "A Design for a Study of American Youth;" "The American High School;" "The American High School Student."

Specific skills

18-P-1 RELATING GROUP ADMINISTERED BENDER-GESTALT TEST FUNCTIONING TO EARLY DEVELOPMENT IN LEARNING TO READ

Purpose: To develop early identification techniques to uncover potential reading problems of varying degrees and types.

Subjects: Elementary and preschool children.

Methods: Randomly selected primary and intermediate level elementary school youngsters in groups of 10 will be administered the Bender-Gestalt test using spiral-bound Bender plates. The S.R.A. Primary Mental Abilities Test will have been administered, as well as appropriate form of the Gates Reading Survey. A tangential project will examine preschoolers in groups of 10 during their regularly scheduled readiness testing in the spring, before they enter school, with the Bender-Gestalt. Psychometric correlations and deviation scores will be computed on a new, empirically developed Bender-Gestalt scoring system for all elementary grade levels. Material gathered from preschoolers will be looked at after completion of each grade through third to determine predictive value of Bender functioning in uncovering potential reading problems.

Duration: September 1963-June 1965.

Investigator(s): Sheldon L. Shubert, M.A., Psychologist, Board of Education of Baltimore County, Towson, Md. 21204. (Reported by Charles Leiman, Ph.D., Supervisor of Psychological Services, Board of Education of Baltimore County.)

Publication: Data will be released in departmental publication.

18-P-2 LONGITUDINAL STUDIES OF CHILDREN WHO LEARNED TO READ AT HOME, PRIOR TO ENTERING FIRST GRADE

Purpose: To assess the relative frequency of preschool readers; to identify factors within the child and his home environment that fostered early learning; to study advantages, or problems, of this earlier start in reading.

Subjects: In first study, 49 children in the Oakland, California Public Schools (Bulletin 10, Research Relating to Children); in second study, 156 children in the New York Public Schools and 30 children in a control group.

Methods: (1) Reading tests, Stanford-Binet Intelligence Test, Torrance's Test

of Creative Thinking, Word Memory Test, Bender-Gestalt, and Primary Mental Abilities Test; (2) parent interviews; and (3) teacher rating scales.
Findings: Children who read early encounter no problems with school instruction in reading; most profit from their early start, especially those with lower I.Q.'s. Early readers show wide variation in I.Q.'s and in socio-economic backgrounds. Most early readers are first interested in writing, afterwards in reading.
Duration: September 1958-June 1964.
Investigator(s): Dolores Durkin, Ph.D., Associate Professor of Education, Teachers College, Columbia University, New York 27, N. Y.
Cooperating group(s): Horace Mann-Lincoln Institute of School Experimentation.
Publication: Monograph covering both studies will be written in 1964.

18-P-3 INVESTIGATION INTO THE EFFECTS OF EXTENSIVE RECREATIONAL READING ACTIVITIES UPON THE READING INTERESTS, HABITS, AND SKILLS OF FIRST GRADE CHILDREN

Purpose: To determine effects of an extensive recreational reading program.
Subjects: First grade pupils in 5 classrooms in Lackawanna, New York.
Duration: January 1964-June 1965.
Investigator(s): William Eller, Ph.D., Director, Teacher Education, and Donald Pfau, Ed.D. Candidate, State University of New York at Buffalo, Buffalo, N. Y. 14214.
Cooperating group(s): Western New York School Study Council.

18-P-4 READING

Purpose: To study some of the factors causing reading difficulty.
Subjects: Elementary school children divided into groups of good and poor readers.
Methods: Subjects administered psychological tests; interviews with mothers.
Duration: September-December 1964.
Investigator(s): Dave Clarke, Ph.D., Supervisor of Individual Service, and Dave Ellingson, B.A., School Psychologist, and staff, Seattle Public Schools, 3045 42nd St., S.W., Seattle, Wash. 98116. (Reported by Mildred Laura Hittman, M.S.W., School Social Worker, Seattle Public Schools.)

18-P-5 MEDICAL ASPECTS OF READING DISORDERS

Purpose: To study various aspects of reading disorders, including development of visual perception, subclinical reading epilepsy, and related problems.
Subjects: School children with reading disorders.
Methods: EEG studies on children while reading; studies of various strata of civilization in the same ethnic groups.
Findings: Some children with reading disorders are found to have abnormalities in the brain which prevent reading.
Investigator(s): Leon Oettinger, Jr., M.D., Assistant Clinical Professor of Pediatrics, University of Southern California, Los Angeles, Calif.
Publication: *Journal of Pediatrics*.

18-P-6 A SURVEY OF VOLUNTARY WITHDRAWALS FROM AN INDIANAPOLIS SECONDARY SCHOOL WITH SPECIAL REGARD FOR READING LEVEL

Purpose: To determine: (1) if voluntary withdrawals have significantly low reading levels; and (2) if methods used in teaching reading had some effect

on level.
Subjects: Random representative sample of 1963-64 voluntary withdrawals from high school.
Methods: Survey-cross break of significant factors.
Findings: Reading ability was not a factor or cause of withdrawal as withdrawal group was not significantly low in reading. Chronic absence and high mobility were significant influences. About 10 percent of causes for withdrawal were directly related to academic work.
Duration: 1964.
Investigator(s): Joseph C. Payne, M.S., Supervisor of Educational Research, Indianapolis Public Schools, 150 N. Meridian St., Indianapolis, Ind.
Publication: Information may be obtained from investigator.

18-P-7 AN APPROACH TO THE CORRECTION OF READING DISABILITY THROUGH PARENT AND TEACHER GROUPS

Purpose: To determine whether a learning problem associated with reading disability could be identified early and accurately in the child's school career by utilizing existing procedures rather than adding new ones. To develop the most economical type of intervention aimed at reducing the incidence of reading disability, utilizing existing classroom structure with the addition of minimal consultation to school personnel and weekly group sessions with parents.
Subjects: 60 children from first and second grades in 1961-1962 school year and in first, second, and third grades in 1962-1963 school year. 18 girls and 42 boys were identified as predicted to have eventual reading problems, as they scored at or below the 50th percentile on a routine reading readiness test while in first grade. 30 were in the group whose parents attended discussion sessions; 30 in the noncontact group.
Methods: Group sessions with parents and study meetings with teachers were held to gain information about family processes and classroom procedures which might have bearing on children's reading disability. Tests to determine reading level were administered to contact and noncontact groups at conclusion of parent and teacher sessions.
Findings: Presented at annual meeting of American Orthopsychiatric Association, Chicago, March 1964.
Investigator(s): Harris B. Peck, M.D., Associate Professor of Psychiatry, and Meyer Rabban, Ph.D., Research Associate, Albert Einstein College of Medicine, Yeshiva University, New York, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-P-8 THE EFFECT OF TYPE SIZE ON READING AND SCHOOL ACHIEVEMENT IN PARTIALLY SEEING CHILDREN

Purpose: To investigate the role which size of printed type plays in the school achievement of partially seeing children.
Subjects: Approximately 1,000 partially seeing pupils and 600 visually normal pupils in grades 5 and 6.
Methods: Partially seeing pupils in 15 states have been tested with five alternate forms of the Metropolitan Achievement Test (reading and language subtests), each form in a different type size (12, 15, 18, 21, and 24 point type). Subjects will be given the complete Stanford Achievement Test in the type size in which they scored best on the Metropolitan.
Investigator(s): Jack W. Birch, Ph.D., Associate Dean, and William J. Tisdall, Ph.D., Assistant Professor, School of Education, University of Pittsburgh, Pittsburgh, Pa.
Cooperating group(s): Cooperative Research Branch, Office of Education, U. S.

Department of Health, Education, and Welfare.
Publication: To be submitted for journal publication.

18-P-9 ORAL AND WRITTEN LANGUAGE OF CHILDREN IN GRADES 4 AND 6 COMPARED WITH THE LANGUAGE OF THEIR TEXTBOOKS

Purpose: To discover by structural analysis the characteristics of children's language in a Southwestern geographical area; to compare children's written and oral language with each other, and with the language of their textbooks.
Subjects: Approximately 200 children who represent normal school population of grades 4 and 6; approximately 100 Negro children in grade 4.
Methods: Initially, data concerning intelligence, reading ability, personality, age, sibling status, verbal and nonverbal maturity, and achievement of subjects will be gathered, as well as information about the socio-economic status and education of parents. After a written and an oral sample of children's language are obtained through single type of stimulus (picture), syntactical units of both oral and written language will be analyzed by modern linguistic methods. Statistical studies will show correlation between children's language and variables such as age, maturity, etc. Samples of language of several textbooks used in two grades will be analyzed in same manner as children's language, and language structures of textbooks and children will be compared.
Duration: January 1964-July 1965.
Investigator(s): Mildred E. Riling, M.A., Associate Professor of English, Southeastern State College, Durant, Okla. 74701.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

18-P-10 A COMPARISON OF THE USE OF PHYSICAL EDUCATION ACTIVITIES AND THE LANGUAGE WORKBOOK AS LEARNING MEDIA IN THE DEVELOPMENT OF LANGUAGE ARTS CONCEPTS WITH THIRD GRADE CHILDREN

Purpose: To compare a predominantly "motor" activity learning medium with a predominantly "verbal" learning activity medium in the development of language arts concepts.
Subjects: 20 third grade children.
Methods: On basis of a pretest of eight language arts concepts, subjects were equated into two groups of 10. One group was taught by use of physical education activities and the other by use of a language workbook. Both groups were retested and comparisons were made. A comparison of pre- and post-test scores of LW group and PE group, and the post-test scores of both groups, was computed by using standard error of mean difference and the t ratio.
Findings: Obtained t for LW group was significant at .05 level and for the PE group at .01 level. Obtained t for the post-test of LW group and PE group was not significant. In PE group seven children showed a higher gain, in the LW group two children showed a higher gain, and one was the same.
Investigator(s): James H. Humphrey, Ed.D., Professor of Physical Education and Health Education, University of Maryland, College Park, Md.
Publication: Results of this and similar studies will appear in a textbook currently in preparation.

18-P-11 GEOGRAPHIC EXPERIENCES WITH SECOND GRADE CHILDREN

Purpose: To determine the growth and development of second graders during a school year in understanding map making, geographic terms, and relationships of location and space.

Subjects: Second grade children in a suburban school district outside Pittsburgh, Pa.
Methods: Drawings; field experiences; diary kept by teacher.
Findings: Children have difficulty with directions and with space relationship of local environment; they have less difficulty with removed environment. Second grade children can work with a large number of geographical concepts.
Duration: Fall 1963-fall 1964.
Investigator(s): John D. McAulay, Ed.D., Professor of Education, Pennsylvania State University, University Park, Pa.
Publication: To be published in fall or winter 1964-1965.

18-P-12 FACTORS AFFECTING COLLEGE STUDENTS' ACHIEVEMENT IN SCIENCE

Purpose: To determine to what extent factors such as reading ability, intelligence, interest, and science achievement, investigated during the Science Motivation Project (Bulletin 11, Research Relating to Children), may be related to later election of, and success in, science courses in college; to determine to what extent backgrounds of secondary-school science teachers of these students may be related to students' election of, and success in, college science courses.
Subjects: 3,000 students who participated in Science Motivation Project I, from public high schools in Illinois, Indiana, Ohio, and Michigan.
Methods: Scores made by students on science tests are evaluated for relationship with scores of students in science courses in college.
Duration: July 1963-December 1967.
Investigator(s): George G. Mallinson, Ph.D., Dean, School of Graduate Studies, Western Michigan University, Kalamazoo, Mich.
Cooperating group(s): Cooperative Research Branch, Office of Education, U. S. Department of Health, Education, and Welfare.

Special education

18-Q-1 AN EDUCATIONAL PROGRAM FOR SLOW LEARNERS IN GRADES SEVEN THROUGH TWELVE

Purpose: (1) To meet the needs of unsuccessful slow learners for vocational preparedness; (2) to retain the slow-learning, socially-alienated student in the school program through twelfth grade; and (3) to provide opportunity for and guidance toward adequate personal and emotional development for the failure-prone student.
Subjects: Approximately 225 students in grades 7 through 12 in Quincy, Ill. public schools. Subjects ranked in lowest 10 percent on a composite score for intelligence, socio-economic status, achievement, and educational stability.
Methods: Subjects are divided into groups of 20. Teacher is assigned to each group for a three-hour period; remains with group for three years beginning in seventh grade. Teachers assigned in ninth grade remain with groups through twelfth grade and accompany their groups to classes such as music and industrial arts. Daily learning experiences include attention to daily living needs and work-study experience. Work experience is provided in school setting and local industry.
Duration: June 1963-June 1968.
Investigator(s): Charles V. Matthews, M.S., Administrative Director; J. Robert Russo, Ed.D., Administrative Consultant; Edward Griffin, M.S., Director and Instructor in Education; James L. Odorizzi, M.S.; and George F. Gruendel, M.S., Research Assistants and Demonstration Teachers, Center for Study of Crime, Delinquency, and Corrections, Southern Illinois University, Edwardsville, Ill.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: To be published periodically as program progresses.

18-Q-2 SUMMER SCHOOL: HOME SCHOOL GUIDANCE AND STRENGTHENING PROJECT

Purpose: To raise the level of achievement and aspiration of pupils leaving junior high school for senior high. To study longitudinally high school failures and effect this type of program can have on them.
Subjects: 8A students in Summer School Strengthening Program at Fulton Junior High School.
Methods: Intensive counseling with pupils concerning their ability and achievement; informing parents of their children's abilities and achievements and level of accomplishment they should expect.
Duration: June 1964-June 1967.
Investigator(s): Paul C. Baumann, M.S., Principal, and Edward Wilkinson, M.E., Assistant to the Principal, Robert Fulton Junior High, Milwaukee Public Schools, Milwaukee, Wis.
Publication: Results will be made available to the Milwaukee School Board and can be requested from them.

18-Q-3 AN EXPERIMENTAL DEMONSTRATION AND EVALUATION PROGRAM: DELINQUENCY PREVENTION IN THE SEVENTH GRADE STRUCTURE OF COLUMBUS, OHIO'S JUNIOR HIGH SCHOOLS IN THE HIGH DELINQUENCY AREAS

Purpose: To demonstrate that prevention of delinquency, school dropout, and underachievement can be an integral and effective part of the classroom program; to demonstrate that regular teachers can be used to have a preventive impact on potentially delinquent boys at threshold age of official delinquency; to show that a junior high school classroom program can be geared to implant effective insulation against delinquency in potentially delinquent boys in high delinquency areas.
Subjects: Sixth grade teachers in slum, elementary schools nominated boys at end of the year who were likely to get into trouble soon and likely to drop out of school when older. Half of the nominated group was kept in the program; the progress of the other half, as well as "good boys", is also being followed. Clearance for performance, truancy, complaints to police, and appearances in juvenile court will be made. A new cohort goes through each year for three years; then clearances of the experimental group, control, and second controls ("good boys") for four years.
Methods: Models of behavior, geared to slum boys, are presented through reading material, tapes, movies, stimulus stories, and visitors. Within the seventh grade content of self-contained classes (three consecutive class periods each day), five units for presentation of models have been developed, each lasting from three to four weeks: "The World of Work," "What We Can Get From School," "Family Life," "What Government Does for Me," "How to Get Along with People." Planning meetings are held between research associates and teachers daily, and with the psychiatrist weekly.
Duration: July 1963-1969.
Investigator(s): Walter C. Reckless, Ph.D., and Simon Dinitz, Ph.D., Professors of Sociology, Ohio State University, Columbus, Ohio.
Cooperating group(s): Ohio State Research Foundation; Ohio State University Development Fund; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-Q-4 AN EVALUATION OF THE EFFECTIVENESS OF AN ENRICHED CURRICULUM IN OVERCOMING THE CONSEQUENCES OF ENVIRONMENTAL DEPRIVATION

Purpose: To evaluate the effectiveness of a long-term program of enrichment in improving the conceptual, language, and motivational attainment of lower socio-economic class children.
Subjects: Children from lower socio-economic backgrounds in New York City.

Methods: Experimental groups of children, beginning at preschool level and continuing through third grade, will be taught with a curriculum designed to provide stimulation in areas of cognitive, intellectual, verbal, and social development. Comparisons will be made with various control groups.
Findings: Pilot findings indicate significant gains in intellectual and language development for experimentally enriched children.
Duration: July 1964-December 1969.
Investigator(s): Martin Deutsch, Ph.D., Director, and Leo Goldstein, Ph.D., Senior Research Associate, Department of Psychiatry, Institute for Developmental Studies, New York Medical College, New York 29, N. Y. (Reported by Fay Boulware, Administrative Coordinator, Institute for Developmental Studies.)
Cooperating group(s): Ford Foundation.
Publication: Findings will be made available in major psychological and educational journals as well as through Institute for Developmental Studies publications.

18-Q-5 ENRICHMENT PROGRAM: AN AID FOR THE EDUCATIONALLY RETARDED

Purpose: To evaluate effectiveness of an enrichment program designed as a measure for coping with the problem of academic retardation.
Subjects: 10 classes involving 239 students, retarded by as much as 4.4 years (median 2.9), and having average class I.Q.'s of 72 to 85.
Methods: Intelligence and achievement of students was surveyed. Pre- and post-test method was used for evaluating growth.
Findings: Each of the 10 classes progressed at a rate beyond the average achievement expected. Eight classes made normal or above normal academic growth. Three classes gained as much as 12 to 13 months during the six-month period of enrichment evaluated. There was significant change in retardation status of the total group. Continuous rate of retardation in these groups was diminished; children with backgrounds and abilities like those involved in the study can and will, on the average, progress normally when educated in an enriched environment.
Duration: October 1962-April 1963.
Investigator(s): Octavia B. Knight, M.A., Director of Special Education, and Norman C. Johnson, Ed.D., Associate Professor of Education, North Carolina College, Durham, N. C.
Publication: North Carolina Teachers Record, March 1964.

18-Q-6 INTERVENTION IN THE COGNITIVE DEVELOPMENT OF THE CULTURALLY DEPRIVED AND FUNCTIONALLY RETARDED NEGRO PRESCHOOL CHILD

Purpose: To assess effectiveness of a preschool program as an intervention technique; to increase involvement of parents in education of their culturally deprived and functionally retarded child.
Subjects: From a total preschool population of a selected school district, a group of 3 and 4 year old Negro children from culturally deprived homes and diagnosed as mentally retarded are placed in matched control and experimental groups.
Methods: Experimental group attends a school-based, cognition-oriented program in the morning. Once a week, one of preschool teachers visits home of each experimental group child to conduct a home-based program in which parents participate in educational process. Groups of parents meet regularly to discuss mutual problems relating to children's education. Aside from initial testing and interviews, no further intervention occurs with children or parents of control group. Standardized tests are employed to discuss intellectual, academic, and school adjustment progress of both groups. Subjects will be followed through early elementary school years.

Duration: January 1964-December 1967.
Investigator(s): David P. Weikart, M.A., Director of Special Services and School Psychologist, Ypsilanti Public Schools, 300 W. Forest, Ypsilanti, Mich.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

18-Q-7 THE EDUCATIONAL EFFECT OF A PARENTS' COOPERATIVE "ENRICHMENT" NURSERY SCHOOL PROGRAM ON LOWER CLASS NEGRO CHILDREN

Purpose: To determine whether a parents' cooperative "enrichment" nursery school program can significantly improve verbal, reading, and general school performance of culturally disadvantaged Negro children.
Subjects: 40 lower-class Negro children, 3 years 10 months to 5 years of age.
Methods: Experimental and control groups initially matched for I.Q., age, and reading readiness will be retested after six months and during first, third and fifth grades.
Duration: December 1963-indefinite.
Investigator(s): Gerald D. Alpern, Ph.D., Senior Staff Psychologist and Assistant Professor, Medical School, Indiana University, Indianapolis, Ind.
Cooperating group(s): Board for Fundamental Education.
Publication: Report to be submitted to Board for Fundamental Education; other publication possible.

18-Q-8 A GROUP DAY CARE PROGRAM FOR CULTURALLY DEPRIVED CHILDREN AND PARENTS

Purpose: To determine the effects of a day care plus parent education program on the development of school readiness in underprivileged preschool children. In organizing day care project, special attention will be given to development of an intensive nursery program by which school readiness may be fostered and developed in the child. Aim of parent education program will be to encourage parents to support and reinforce those readiness skills child acquires in day care center. Evaluation will focus on possible cognitive, social, and emotional changes in children and extent to which there is modification in parental style of home and child management.
Subjects: Experimental group: 38 children, approximately 3 years of age when entering nursery school, and their parents; control group: 67 children, approximately 3 years of age, and their parents.
Methods: Tests administered yearly, including Stanford-Binet, Merrill-Palmer, Illinois Test of Psycholinguistic Abilities, and George Peabody Picture Vocabulary Test. Techniques used to study children's reactions to day care program include observations, teacher ratings, and standardized situations.
Duration: 1964-1966.
Investigator(s): Flemmie P. Kittrell, Ph.D., Professor and Head, Department of Home Economics, Howard University, Washington, D. C.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Q-9 SPECIFIC READING DISABILITY: TEACHING BY STIMULATION OF DEFICIT PERCEPTUAL AREAS

Purpose: To assess effectiveness of stimulation of areas of perceptual deficit. Specific questions to be answered are: (1) "Can perceptual deficiencies associated with specific disability be trained out through stimulation of areas of perceptual deficiency?" and (2) "Is improved perception reflected in improved reading achievement?"
Subjects: 40 boys, 7 to 11 years, I.Q.'s 85 and above, referred to Mental

Hygiene Clinic for specific reading disabilities.
Methods: Cross-over training design offering stimulation of deficit perceptual areas; "contact" sessions utilizing basal reader approach as alternate treatments. Each subject serves as his own control.
Duration: January 1964-December 1965.
Investigator(s): Archie A. Silver, M.D., Associate Clinical Professor of Psychiatry, Rosa A. Hagin, Ph.D., Instructor in Clinical Psychology, Department of Psychiatry, Medical Center, New York University, New York, N. Y.
Cooperating group(s): Carnegie Corporation of New York.

18-Q-10 A STUDY OF THE EFFECTIVENESS OF TRAINING RETARDED READERS IN AUDITORY PERCEPTUAL SKILLS UNDERLYING READING

Purpose: To explore the efficacy of additional auditory training for retarded readers in improving their reading skills; to develop an auditory training program.
Subjects: Third grade children from low socio-economic neighborhoods who are retarded in reading.
Methods: Reading and auditory training programs are given to a group of three or four children. Auditory program has been developed by staff; remedial reading program has eclectic approach.
Duration: June 1963-December 1965.
Investigator(s): Shirley Feldmann, Ph.D., Assistant Professor, and Cynthia P. Deutsch, Ph.D., Associate Professor, Institute for Developmental Studies, Department of Psychiatry, New York Medical College, New York 29, N. Y. (Reported by Fay Boulware, Administrative Coordinator, Institute for Developmental Studies.)
Publication: To be published at termination of project.

18-Q-11 "GOING TO COLLEGE": RE-MOTIVATING ELEMENTARY SCHOOL CHILDREN WHO HAVE SUFFERED READING FAILURE

Purpose: To determine whether a new surrounding might effectively motivate children to try again; to determine whether this will give them a new status with peers who have considered them "dull," "stupid," and/or "troublemakers."
Subjects: 21 children from Fitler Elementary School in Philadelphia. Children are culturally deprived, 6 to 12 years old, in grades 1 through 5. All but one have been "left back" at least one grade.
Methods: Remedial reading methods commonly practiced were used with two exceptions: (1) "Going to College" during a school day, two hours weekly; (2) closer relationship between pupil and instructor--one to one, two to one, three to one.
Findings: In initial findings after an experiment of 12 weeks, 7 improved reading level and gained higher approbation at school while 14 remained the same; 4 were retarded intellectually; 2 had psychological disturbances insurmountable at the time; and 8 remained on same reading level. All felt they had improved.
Duration: February 1964-May 1965.
Investigator(s): Adeline Wishengrad Gomberg, Ed.D., Assistant Professor of Education and Director, Reading Clinic, Beaver College, Glenside, Pa.
Cooperating group(s): Philadelphia Board of Education.
Publication: To be submitted to reading journals and/or psychology magazines or published in book form.

18-Q-12 THE USE OF PROGRAMMED INSTRUCTION FOR THE INVESTIGATION OF COMMUNICATIVE DISORDERS IN CHILDREN

Purpose: To determine the hierarchies of habits and skills involved in certain aspects of human communication; to describe communicative disorders in terms of exact manner in which these hierarchies are disrupted or maldeveloped.

Subjects: Children with speech, hearing, language, and reading disorders.

Methods: Instructional programs for individual children are developed to assess and teach basic skills such as color and shape matching, and systematically proceed to develop further programs which will assess and teach more complex skills such as color and shape naming. In this way, an objective and reliable description of acquisition of basic skills will be developed, and at the same time sets of instructional programs will be amassed.

Findings: Thus far, general strategy of assessing hierarchies of productive skills has proven quite fruitful.

Duration: October 1963-September 1968.

Investigator(s): Donald G. Doehring, Ph.D., Director, School of Human Communication Disorders and Associate Professor of Otolaryngology, McGill University, Montreal 2, Que.

Cooperating group(s): Quebec Department of Health; Canadian Department of National Health and Welfare.

Publication: To be published in psychology, speech and hearing, and child development journals, as appropriate.

18-Q-13 IMPROVEMENT OF LANGUAGE USAGE IN THE MENTALLY RETARDED

Purpose: To improve functioning ability of children who are unable to use language for purpose of communication.

Subjects: 30 mentally retarded children, C.A.'s 7.3 to 18.3, Stanford-Binet I.Q.'s from below norms to 53, all having some problems in communication.

Methods: Subjects divided into two general types of language difficulties on basis of neurophysiological theory of Dr. Lise Gellner and paired on basis of Gellner Classification and scores on Illinois Psycholinguistic Abilities Test. Children reside in social-living day care unit from 8:30 to 4:00 where all activities are established around language. Individualized language training is given by a psychologist and a professional worker. Eight psychological and achievement tests were administered at beginning of experiment; post-tests will be completed in October 1964.

Duration: February-October 1964.

Investigator(s): Betty H. Bradley, M.A., Psychologist, and Ruth A. Maurer, Nurse, Columbus State School, 1601 W. Broad St., Columbus, Ohio.

Publication: To be published in psychological or educational journal.

18-Q-14 A FEASIBILITY STUDY TO INVESTIGATE THE INSTRUMENTATION, ESTABLISHMENT, AND OPERATION OF A LEARNING LABORATORY FOR HARD-OF-HEARING CHILDREN

Purpose: To determine: (1) feasibility of establishing a self-instructional, self-operational learning laboratory for the observation of lipreading experiences by the acoustically handicapped; (2) feasibility of developing and practicing lipreading skills without physical presence of instructor; (3) instructional value of short, single-concept, eight millimeter sound films for repetitive instruction and practice; (4) behavioral reactions of hard-of-hearing child to utilization of such a learning laboratory system; (5) speculated use of a similar system in other subject areas, for other instructional problems related to education of hard-of-hearing student; (6) recommended areas of further study and research into use of instructional systems for hard-of-hearing; (7) functional design of learning laboratory facilities for individualized instruction.

Methods: Demonstration laboratories will be set up in Hard-of-Hearing Unit of Prescott Elementary School, Lincoln, Nebraska and Speech and Hearing Clinic, University of Nebraska.
Duration: June 1963-December 1964.
Investigator(s): Robert E. Stepp, Ph.D., Assistant Director, and staff, University Extension Division, University of Nebraska, Lincoln, Nebr. 68508.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

18-Q-15 PREPARATION AND EVALUATION OF AN ANALYTIC CURRICULUM IN ENGLISH FOR DEAF STUDENTS AT THE SECONDARY LEVEL

Purpose: To develop materials for teaching English, using concepts of modern mathematics.
Subjects: College preparatory students at Gallaudet College.
Methods: Using Stokoe's mathematical models of the English language (William C. Stokoe, Jr., The Calculus of Structure, to be published by Bobbs-Merrill) and Greenberg's analysis of errors made by deaf students (B. L. Greenberg and S. Withers, A Short Guide to Better Writing, in publication at Bobbs-Merrill), new analytical tools for the description of English and related curricular materials will be developed and tested against conventional methods.
Duration: August 1964-June 1968.
Investigator(s): William C. Stokoe, Jr., Ph.D., Professor of English, Harry Bornstein, Ph.D., Director, Office of Institutional Research, and Bernard L. Greenberg, M.A., Associate Professor of English, Gallaudet College, 7th and Florida Ave., N. E., Washington 2, D. C. (Reported by George Detmold, Dean, Gallaudet College.)
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

18-Q-16 PROGRAMMED LEARNING MATERIALS FOR THE BLIND

Purpose: To determine: (1) What formats of stimulus and response modes seem to be most suitable for using programmed materials with the blind; (2) what personal factors of the blind person may influence the use of programmed materials; and (3) what may be the optimal length of a program suitable for use with the blind.
Subjects: Blind and partially sighted children at Michigan State School for the Blind.
Methods: Four stimulus response modes for program research and science were used: Braille-auditory, Braille-Braille, auditory-auditory, and auditory-Braille. Students were then tested for speed and error on programs.
Findings: Blind students can handle 45 to 55 frames per average class without difficulty; stimulus response mode is Braille-Braille.
Duration: January-December 1963.
Investigator(s): George G. Mallinson, Ph.D., Dean, School of Graduate Studies, Western Michigan University, Kalamazoo, Mich.
Cooperating group(s): Hines Veterans Administration Hospital; Johanna Bureau of the Blind; Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted to The New Outlook for the Blind.

18-Q-17 PROGRAMMED EDUCATION FOR THE JUVENILE DIABETIC AND HIS PARENTS

Purpose: To evaluate teaching machine instruction.
Subjects: Juvenile diabetics and their parents.

Methods: Evaluation of care before and after exposure to programmed education using teaching machine technique. Basic laboratory data is being collected before and after evaluation.
Duration: June 1964-June 1965.
Investigator(s): Donnell D. Etzwiler, M.D., Pediatrician, St. Louis Park Medical Center, Minneapolis, Minn. 55416.
Cooperating group(s): Minnesota State Health Department; Bureau of State Services, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Data to be published.

18-Q-18 RELIGIOUS CONCEPTS OF THE MENTALLY RETARDED

Purpose: To ascertain at various levels what the retardate understands of religious concepts. Specifically, to compare effectiveness of lecture, catechetical, and visual presentation methods for religious instruction, including confirmation instruction; to determine the ideal repetition patterns for most effective learning; to determine value of programmed learning in religious instruction; to determine effectiveness of various kinds of visual presentations; to compare deductive and inductive methods of teaching religious truths.
Subjects: Trainable and educable retardates.
Investigator(s): Rev. Oliver Graebner, Ph.D., Professor of Psychology, Valparaiso University, Valparaiso, Ind. (Reported by Rev. C. F. Golisch, Executive Director, Bethesda Lutheran Home, Watertown, Wis.)
Cooperating group(s): Bethesda Lutheran Home.
Publication: Information available from Bethesda Lutheran Home.

18-Q-19 AUTOMATION IN VOCATIONAL TRAINING OF MENTALLY RETARDED AND/OR MENTALLY ILL ADOLESCENTS

Methods: Experimental teaching aids under development and in common practice utilized with the programmed instructional material.
Duration: October 1962-September 1965.
Investigator(s): Henry Platt, Ph.D., Director, Training Division, and Louis Kukoda, M.Ed., Coordinator, Vocational Services, Devereux Foundation Institute for Research and Training, Devon, Pa. 19333.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

18-Q-20 AN EDUCATIONAL EXPERIMENT WITH YOUNG MENTALLY HANDICAPPED CHILDREN BASED ON A NEUROPHYSIOLOGICAL CONCEPT OF MENTAL RETARDATION

Purpose: To investigate the habilitative value of diagnosing a mentally handicapped child's specific neurophysiological disability, or combination of disabilities, thereby providing the educator with a new and scientific basis for the approach to special teaching. To demonstrate that: (1) perceptual disabilities can be diagnosed; and (2) children identified as mentally deficient can learn if teaching methods are applied which use the intact cerebral systems of vision and/or audition.
Subjects: Children, aged 5 through 7 with I.Q.'s between 25 and 60.
Methods: (1) Identification of children by age, I.Q., and diagnostic examination of their perceptual disabilities; (2) grouping of children according to their predominant disability; (3) teaching by methods suited to diagnoses of disability; (4) using control groups; and (5) measuring the children's growth.

Duration: June 1963-September 1965.
Investigator(s): Thomas Hockman, M.A., Supervisor of Special Education, School District No. 11, Colorado Springs Public Schools, 1115 N. El Paso St., Colorado Springs, Colo., and Lise Gellner, M.D., 2 Kensington Hall Gardens, London W. 14, England. (Reported by Helen K. Bailey, Director, Department of Pupil Accounting and Testing Services, School District No. 11.)
Cooperating group(s): Colorado State Department of Education.
Publication: No specific plans yet; inquiries may be addressed to the project director.

18-Q-21 PUBLIC SCHOOL CLASSES FOR THE EMOTIONALLY HANDICAPPED: A RESEARCH ANALYSIS

Purpose: To study present operations and thus focus on pupil, teacher, and research needs.
Subjects: 74 classes totalling 530 children.
Methods: Questionnaires, site visits, observations, and pupil interviews.
Duration: January 1963-September 1964.
Investigator(s): William C. Morse, Ph.D., Professor of Educational Psychology, and Richard L. Cutler, Ph.D., Associate Professor of Psychology, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Council for Exceptional Children, National Education Association.
Publication: To be published by Council for Exceptional Children.

18-Q-22 THE CHILDREN'S CENTER: A SCHOOL FOR EMOTIONALLY DISTURBED CHILDREN

Purpose: Pilot project attempting to find an economical and efficient way to use specially selected teachers for the education and social re-education of emotionally disturbed children with a minimum amount of psychiatric consultation.
Subjects: Seven to nine year old children, ineducable by usual school standards due to emotional disturbance, who probably can be returned to public school within two years. Control groups are being utilized for preparative studies.
Methods: (1) Teacher-pupil ratio of 1 to 7; (2) daily teacher consultation with volunteer psychologists; (3) weekly group therapy session for teachers; and (4) weekly group therapy session for parents with volunteer psychiatrists.
Findings: Thus far, 50 percent of children have been returned to public school within a two-year period with a minimal financial cost and a maximum emotional cost to teachers. It is believed that secondary prevention is possible through this method.
Investigator(s): Irwin S. Jacobs, M.D., Medical Director, Ray Chaffins, M.Ed., Director, Children's Center, 155 N.E. 51st St., Miami, and Dean Beery, Ph.D., Dean, College of Education, University of Miami, Coral Gables, Fla.
Cooperating group(s): Dade County Board of Public Instruction.
Publication: Results to be published at end of 1964-65 school year.

18-Q-23 USE OF PROGRAMMED INSTRUCTION WITH DISTURBED STUDENTS

Purpose: To investigate the academic progress, therapeutic improvement, and change in social relationships with peers and authority figures achieved through use of programmed instruction as compared with conventional media.
Subjects: (1) Children enrolled in elementary and secondary school program at Vermont State Hospital; (2) students in below average sections of freshman class of one public and one parochial high school; and (3) small group of elementary age students in a private residential treatment center for emotionally disturbed children.

Methods: In each of the settings subjects are randomly assigned to a control and an experimental group. Control group receives usual type of instruction while experimental group receives programmed instruction for three academic subjects and joins control group for the fourth. Method of instruction for each group is alternated. In some instances change will occur each semester, in others at the end of the year, and in one instance method will be same for two years. Evaluations will be made at beginning and end of each semester by administration of group or individual intelligence tests, achievement tests, projective tests, sociometric data, and evaluations by those having regular contacts with students. Hospital students will also be evaluated by their psychiatrists.
Duration: June 1963-May 1966.
Investigator(s): Donald M. Eldred, M.A., Chief Psychologist, and George W. Brooks, M.D., Assistant Superintendent, Vermont State Hospital, Waterbury, Vt.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: No publication anticipated beyond progress report to be available in fall 1964.

18-Q-24 EVALUATION OF A SEX HYGIENE CLASS FOR ADOLESCENT PSYCHIATRIC INPATIENTS

Purpose: To evaluate effects of a sex hygiene class for adolescent psychiatric inpatients on their level of sex information, subjective adjustment regarding sex, general subjective adjustment, and deviant sexual behavior; to investigate the interrelations among these variables.
Subjects: 12 to 24 boys and 12 to 24 girls (depending on need for additional replication for statistical reliability of results), ages 12 to 17 and pubertal, who are inpatients in a state hospital youth center, not mentally defective, and without known brain syndrome. Subjects divided into experimental and control groups, equated for psychotic versus nonpsychotic diagnosis, prior sex behavior pattern, and age.
Methods: Experimental group attends sex hygiene class (boys and girls separately), weekly for three months, stressing films, group discussion, etc. related to sexual topics and related personal problems. Before-after testing of experimental and control groups includes sex information test, Rotter Incomplete Sentences Test with additional items related to sex adjustment, and peer ratings of each other on a tabooed sex behavior inventory. Statistical analysis of before-after changes comparing two groups on each measure; reliability coefficients of measures; intercorrelations among pretest measures.
Duration: July 1964-July 1965.
Investigator(s): William R. Morrow, Ph.D., Research Coordinator, and Fred Hammond, M.A., Chaplain, Fulton State Hospital, Fulton, Mo.
Publication: To be published in a professional journal.

EXCEPTIONAL CHILDREN

Gifted

18-R-1 THE GEORGIA GOVERNOR'S HONORS PROGRAM

Purpose: To conduct research designed to assist teachers, counselors, and other school personnel in understanding the nature and needs of Georgia students with exceptional intellectual abilities and unique potential; to aid in understanding the nature of the instructional program for exceptional students.
Subjects: 402 students in grades 11 and 12 from 92 Georgia high schools. 269 were chosen because of high intellectual ability; 133 were chosen because of outstanding ability in art, drama, or music.
Methods: Measures will be collected in five areas: I.Q., achievement level, social-emotional-motivational level, administrative data (size of secondary school unit, etc.), and physical status. For objectives related to nature of pupils, means, standard deviations, and ranges will be specified. For objectives pertinent to implications for school program, the following techniques will be employed: Pearson product-moment correlations and appropriate C.R. tests; Chi-square or critical C.R. tests of differences between frequencies; analyses of variance and, when indicated, appropriate paired comparisons.
Duration: June-August 1964.
Investigator(s): Kathryn Blake, Ph.D., Assistant Professor of Special Education, and Charlotte Williams, Ph.D. Candidate, University of Georgia, Athens, Ga.; William E. Bishop (Ph.D. Candidate, Kent State University), Research Project Manager, Georgia State Department of Education, Atlanta, Ga.
Publication: Incorporated in final report of Governor's Honors Program, released September 1964.

18-R-2 "PRESCRIPTION" FAMILY GROUP THERAPY: A STUDY OF FOCUSED, STRUCTURED GROUP THERAPY WITH HOMOGENEOUS FAMILY GROUPS

Purpose: To evaluate effectiveness of a new approach in group therapy; to investigate important psychodynamic patterns in the precipitous adolescent underachiever who is a former gifted achiever; to examine the precipitous adolescent underachiever from a broad epidemiological viewpoint.
Subjects: Adolescent, gifted boys in grade 10 who were in the upper 25 percent of their seventh grade class, and subsequently dropped to the lower 50 percent in eighth and ninth grades; appropriate control subjects.
Methods: A broad, overall look at the group will be obtained from data already available from Reading Ability and Outcome Study (Bulletin 16, Research Relating to Children). The most important psychodynamic patterns will be determined. One of the important patterns will be chosen and a focused, structured, short-term family group therapy approach will be utilized.
Duration: 1963-June 1965.
Investigator(s): Exall L. Kimbro, Jr., M.D., Harvey A. Taschman, M.S.W., and Beryce MacLennan, Ph.D., Consultant, Mental Health Study Center, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, 2340 University Blvd., East, Adelphi, Md.

Retarded

18-S-1 CALVERT COUNTY DEVELOPMENT

Purpose: To develop and pretest a census mail-out form, a child behavior checklist, and a vocabulary interview test for use in screening a community for mental retardation.

Subjects: Preschool children and persons 18 to 59 years; every 40th household in a rural Maryland county will be sampled.

Methods: Every fortieth household will receive a census form by mail. A trained interviewer will pick up the form and help respondent fill out difficult questions. If a preschool child is a member of the household, the child checklist will be administered to the caretaker.

Findings: Behavior checklist pretest on a sample of six suspected retarded indicated that these children who scored retarded on the checklist also had individual I.Q. scores below 70.

Duration: January-December 1964.

Investigator(s): Paul D. Imre, M.A., M.P.H., Research Associate, Department of Mental Hygiene, School of Hygiene and Public Health, Johns Hopkins University, Baltimore, Md.

Cooperating group(s): Queen Anne's County Health Department; Queen Anne's County Board of Education; Queen Anne's County Welfare Board; Maryland State Health Department; Joseph P. Kennedy, Jr. Memorial Research Fund; Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: To be submitted for publication at completion of project.

18-S-2 THE USE OF CHILDREN'S DRAWINGS AS AN IN-SCHOOL SCREENING PROCESS FOR MENTALLY RETARDED CHILDREN

Purpose: To provide a simple method by which early identification of mentally retarded children may be made.

Subjects: 1732 pupils, grades 1 to 3, in 6 school areas.

Methods: Testing of pupils.

Findings: Ninety-six and nine-tenths percent of mentally retarded were included in teachers' selection of five "worst drawings".

Duration: Continuing to August 1964.

Investigator(s): James W. Hunt, M.Ed., Associate Professor of Education, Mississippi State College for Women, Columbus, Miss. (Reported by John E. Phay, Director of Institutional Research, University of Mississippi, University, Miss.)

Cooperating group(s): Mississippi State Department of Education.

Publication: Current project is follow-up to Study of Screening Procedures for Special Education Services to Mentally Retarded Children, Mississippi State Department of Education, 1960.

18-S-3 CYTOGENETIC AND GENETIC INVESTIGATIONS TO DETERMINE THE ROLE OF CHROMOSOME ANOMALIES IN CASES OF CONGENITAL MALFORMATIONS AND MENTAL RETARDATION WITH A FAMILY HISTORY OF HABITUAL ABORTIONS

Purpose: To determine frequency and mode of transmission of chromosome anomalies in cases of congenital malformations and mental retardation which have a family history of habitual abortions. Habitual aborting was chosen as an indicator of possible parental chromosome translocation.

Subjects: Children with severe congenital malformations and/or mental retar-

dation; parents and other family members of the propositi. Over 400 cases have been examined in past two years.
Methods: (1) Selected children are referred to laboratory by physicians. (2) Pedigree analysis is performed, with appropriate family members in attendance. (3) Karyotype analyses are performed on appropriate subjects, using peripheral blood, skin, or bone marrow as material to be studied in tissue culture. In cases of abortions, several tissues are examined karyotypically, using tissue culture. (4) Interpretation made of genetic findings to referring physician.
Findings: Thus far, approximately ten percent of subjects demonstrate evidence of transmission of chromosomal translocations from a phenotypically normal parent to a defective child. Percentage is high due to selection of cases. The "D/G" type of translocation, often resulting in Mongolism, was most common.
Duration: July 1964-July 1969.
Investigator(s): James D. Eisen, Ph.D., Assistant Professor of Human Genetics and Chief, Human Genetic Laboratories, College of Medicine, University of Nebraska, Omaha, Nebr.
Publication: Paper given at International Congress on Mental Retardation in Copenhagen, August 11, 1964. Publication will be in book form. Three other articles are being prepared.

18-S-4 A BEHAVIOR EVALUATION PROGRAM FOR RETARDED CHILDREN

Purpose: To apply fully controlled, free operant conditioning methods to problems of behavior diagnosis, training, and prognosis among severely retarded children. Initial phase now under way devoted to increasing scope of current methods to delineate reliably different specific patterns of behavior deficits and abilities in individual patients and location of specific prosthetic variables in the immediate "learning" environment which support each patient's most efficient performance.
Subjects: Institutionalized, retarded children selected by severity of presenting problems for caretaking and habilitative personnel as well as by presence of neurological or physiological dysfunction. Comparison subjects selected from other "nonproblem" groups and various behavior-competence subgroups (defined by institutional class, work, or ward placement).
Methods: Adaptations of free operant conditioning, utilizing full environmental control and multiple, simultaneous, continuous, automatic recordings, are being developed to locate and functionally analyze behavior deficits and ability throughout range of retardation. Intensive individual studies will yield multidimensional data analyzed to provide profiles of individual response interactions, resulting from a variety of environmental manipulations.
Findings: Methods applied thus far are extremely sensitive to a broad range of reliably different individual patterns which demonstrate specific forms of behavioral heterogeneity within presumably "homogenous" clinical subgroups. Specific deficits which are differentially amenable to modification by immediate environmental consequences have been located. The prosthetic (reversible) versus therapeutic (nonreversible) effects of such modification are being analyzed. Considerable methodological adaptation has become necessary to obtain clinically relevant automatic behavior measurements among more severely retetetarded children.
Duration: June 1963-August 1966.
Investigator(s): Beatrice H. Barrett, Ph.D., Director, Behavior Prosthesis Laboratory, and Director of Psychological Research, and Malcolm J. Farrell, M.D., Superintendent, Walter E. Fernald State School, Box C, Waverley, Mass. 02178.
Cooperating group(s): National Association for Retarded Children; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Two articles and one chapter in preparation.

BEST COPY AVAILABLE

18-S-5 MINNESOTA PERCEPTO-DIAGNOSTIC TEST PERFORMANCE IN EDUCABLE MENTALLY RETARDED CHILDREN

Purpose: To establish normative data for a group of educable mentally retarded children on the MPD test; to compare this group with other diagnostic groups for which norms are already determined. Special attention will be given to organicity and different etiological factors in reading disabilities for purposes of differentiation.
Subjects: Samples of 450 normal and 260 behaviorally disturbed school children will be compared with approximately 250 educable retarded children, age range 8 to 21, at Owatonna State School.
Methods: MPD will be administered to these samples and scores will be statistically related and compared.
Findings: Thus far, retarded children rotate designs much more than normals, suggesting organicity and perceptual disorganization.
Duration: May-December 1964.
Investigator(s): A. Burnett, Ph.D., Chief Psychologist, Owatonna State School, Owatonna, and Gerald B. Fuller, Ph.D., Director of Clinical Research, Willmar State Hospital, Willmar, Minn.
Publication: To be submitted to *Journal of Clinical Psychology*.

18-S-6 DEMONSTRATION PROJECT IN PHENYLKETONURIA

Purpose: A five year project in case finding, follow-up, and control of phenylketonuria to be demonstrated in cases identified through screening of mentally retarded groups. Follow-up studies are designed to contribute to Virginia statewide effort in the prevention and treatment of mental retardation due to PKU.
Methods: Case finding will involve screening of mentally retarded populations, State and private mental health clinics, and State and private hospitals for the retarded and mentally ill; special classes in schools on a pilot basis. Follow-up will include screening of siblings in families in which a member has PKU to determine whether other cases exist; screening of relatives of such families as case finding discloses these, (i.e. nephews, nieces, cousins). Family counseling, dietary management, and carrier testing will also be involved.
Duration: June 1962-June 1967.
Investigator(s): Benedict Nagler, M.D., Director, Juanita Wood, A.C.S.W., Psychiatric Social Worker and Associate Director, and Michael Rostafinski, M.D., Associate Director, Lynchburg Training School and Hospital, Colony, Va. 24537.
Cooperating group(s): Virginia Department of Mental Hygiene and Hospitals; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-S-7 A COMPARISON OF LABORATORY TECHNIQUES FOR EARLY DETECTION OF PHENYLKETONURIA

Purpose: To compare the efficacy of the Guthrie inhibition assay test with the LaDu serum phenylalanine test.
Subjects: Approximately 3,000 newborn infants; half obtained at University Hospital, Iowa City, Iowa, and half at Providence Lying-In Hospital, Providence, Rhode Island.
Methods: Simultaneous blood determinations using the Guthrie technique and the LaDu micro technique; techniques are being applied on the first and fourth day of life.
Findings: Thus far, there has been no discrepancy between the LaDu and Guthrie techniques. The study now includes approximately 2,200 subjects. There has not been a false positive found.

Duration: December 1963-November 1964.
Investigator(s): Robert B. Kugel, M.D., Professor of Medical Science, Institute for Health Sciences, Brown University, Providence, R. I. 02906.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-S-8 PHENYLKETONURIA IN SCHOOL AGE RETARDED CHILDREN

Purpose: A demonstration project to identify undetected cases of phenylketonuria in a total school population of retarded children in California (approximately 50,000). It is estimated that 100 new cases of PKU will be detected and that 20 additional cases will be found in siblings of the index cases. By alerting affected families and their physicians, it is hoped that all subsequent newborn siblings in these families will be tested for this disease, and that mental retardation will thereby be prevented or at least minimized.
Methods: Public and private schools and training classes for retarded children sponsored by parent groups are being surveyed.
Duration: July 1962-1965.
Investigator(s): Richard Koch, M.D., Associate Professor of Pediatrics, School of Medicine, University of Southern California, Los Angeles 7, Calif., and Robert A. Henderson, Ed.D., Associate Professor of Special Education, Institute for Research on Exceptional Children, College of Education, University of Illinois, Urbana, Ill.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Materials and methodology developed will be made available to other states and thus serve as a demonstration model for similar school screening efforts.

18-S-9 FAMILY STUDY INTO CARRIER STATE OF PHENYLKETONURIA IN FAMILIES OF KNOWN PHENYLKETONURICS

Purpose: To ascertain unknown carriers of phenylketonuria; to determine other forms of mental retardation in families with member(s) affected by PKU.
Subjects: PKU's from Vineland State School and their families.
Methods: Social contacts with social work; urine loading tests with phenylalanine; blood testing for phenylalanine; tyrosine, tryptophane, and alpha amino nitrogen levels.
Duration: January 1964-January 1967.
Investigator(s): Miles E. Drake, M.D., Ph.D., Clinical Director, Vineland State School, Vineland, N. J.

18-S-10 DEVELOPMENTAL AND INTELLECTUAL ASPECTS IN CHILDREN WITH PKU AND IN CHILDREN WITH GALACTOSEMIA: PREDICTABILITY OF EARLY INFANT TESTING WITH SUBSEQUENT I.Q. ESTIMATES

Subjects: Patients followed longitudinally by a multidisciplinary team at the Child Development Clinic.
Methods: Routine psychometric evaluations by means of Gesell Developmental Scales (with infants and young children under age 4); Stanford-Binet Scale when sufficient language achievement permits test administration.
Duration: 1960-indefinite.
Investigator(s): Karol Fishler, Ph.D., Chief Clinical Psychologist, Child Development Clinic, Children's Hospital of Los Angeles, 4616 Sunset Blvd., Los Angeles 27, Calif.
Publication: To be reported in professional journals when data are completed.

18-S-11 RELATIONSHIP OF PHYSICAL STIGMATA TO INTELLECTUAL SUBNORMALITY IN MONGOLOIDS

Purpose: To obtain evidence on hypothesized relationship between extent of physical stigmata among Mongoloids and their degree of retardation.
Subjects: Institutionalized Mongoloids, 71 males and 57 females, average age 15 years, average I.Q. 24.
Methods: (1) Physical examination, including anthropological measurements; (2) intellectual examination using Stanford-Binet, LM or Cattell Infant Intelligence Scale.
Findings: Thus far, contra-indicative to hypothesized relationship.
Investigator(s): George Domino (Doctoral Candidate), Instructor in Psychology, University of San Francisco, San Francisco 17, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: *American Journal of Mental Deficiency*.

18-S-12 REINFORCEMENT FUNCTIONS IN THE MENTALLY RETARDED

Purpose: To experimentally analyze reinforcement functions in mentally retarded children. Initial studies will be concerned with schedules of reinforcement, delay and goal gradients, the hierarchy of relative effectiveness, and the matrix of positive and negative presentation and withdrawal.
Subjects: Institutionalized mentally retarded children, M.A.'s 2 to 12 years, without chronic illness, severe physical disabilities, etc.
Methods: Experimental laboratory situations will be used, including free-operant and discrete trial learning tasks. Subjects are presented problems individually in repeated sessions, 30 to 60 minutes in duration. Individual patterns of behavior are analyzed.
Duration: June 1964-May 1967.
Investigator(s): Robert Orlando, Ph.D., Assistant Professor of Educational Psychology, University of Minnesota, Minneapolis, Minn. 55455.
Publication: Results will be published in appropriate journals (*Child Development*, *American Journal of Mental Deficiency*, *Psychological Record*, etc.)

18-S-13 BEHAVIORAL STUDY OF MENTALLY RETARDED CHILDREN

Purpose: To collect and analyze behavioral data; to study relationship between behavioral style and level of achievement in order to formulate testable hypotheses as to the predictive significance of a retarded child's behavioral style to his subsequent level of functioning and adaptation in various types of life situations.
Subjects: 50 retarded children of similar socioeconomic background, and mental and chronological age level.
Methods: Behavioral style and level of functioning for each child will be determined by rating a series of interviews with parents and teachers, direct observations of child, and by a summation of the separate ratings from each data source. Following data analysis, any correlations found between various aspects of behavioral style and level of function will permit formulation of a series of testable hypotheses.
Duration: October 1963-September 1966.
Investigator(s): Stella Chess, M.D., Director, Division of Child Psychiatry, and Harold Michal-Smith, Ph.D., Chief Psychologist, Department of Pediatrics, New York Medical College, 106th St. and Fifth Ave., New York 29, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be published in appropriate periodicals.

18-S-14 A STUDY OF THREE STEREOTYPED BEHAVIORS IN INSTITUTIONALIZED MENTAL DEFECTIVES

Purpose: To evaluate the effects of age, sex, and time variations in the three most prevalent forms of stereotyping in institutionalized mental defectives (i.e., body rocking, head rolling, and waving hand before the eye).
Subjects: 83 institutionalized mental defectives, including groups of young and old boys and girls.
Methods: Time sampling over a two-week period.
Findings: Significant variations in body rocking and head rolling as a function of time of day. Peak rates occur prior to meals and rest while valley rates occur following meals and rest. Waving hand before the eye stereotyping is the most stable over time and apparently least responsive to fluctuations related to environmental change.
Duration: January 1963-January 1964.
Investigator(s): Melvin E. Kaufman, Ph.D., Assistant Professor of Psychiatry, and Herbert Levitt, Ph.D., Instructor in Psychology, Medical School, University of Wisconsin, Madison, Wis.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Submitted to American Journal of Mental Deficiency.

18-S-15 MOVEMENT PATTERN CHARACTERISTICS OF EDUCABLE AND TRAINABLE MENTALLY RETARDED CHILDREN

Purpose: To identify those elements in movement patterns which differ in mentally retarded and in normal children, if such differences do indeed exist; to ascertain what elements exist and differ between educable and trainable mentally retarded children.
Subjects: Pupils in a special school for exceptional children; pupils in special classrooms of local public schools; pupils in a special school-related program for underachieving school children; and children in a special program for mentally retarded children, serving on a national basis.
Methods: Subjective evaluation by qualified judges, application of movement pattern inventories and checklists from the literature, use of selected established motor performance "tests", and development and application of special checklists evolving from concurrent study.
Findings: Preliminary findings indicate that movement pattern differences do exist between mentally retarded and normal children and these differences fall into recognizable catagories. In addition, differences both in extent and degree exist between the educable and the trainable mentally retarded, with the amount and severity being directly proportional to extent and severity of retardation. Identification of exact deviations is in process of completion and "formal" classification.
Duration: September 1962-June 1965.
Investigator(s): Barbara B. Godfrey, Ph.D., Professor of Physical Education, University of Missouri, Columbia, Mo.
Cooperating group(s): Achievement Center for Children, Purdue University; Lafayette School System; Wabash School, Lafayette, Ind.; Woodhaven School, Columbia, Mo.; Indiana State Board of Health.
Publication: Probably Research Quarterly (American Association for Health, Physical Education and Recreation) or Journal of Exceptional Children.

18-S-16 EYE FIXATION RESPONSES OF SEVERELY RETARDED CHILDREN

Purpose: To analyze the eye fixation aspect of orienting response in severely defective children.
Subjects: Nonambulatory, severely defective children.
Methods: Rotating or stationary disc presented for varying lengths of time to

estimate whether child is fixating stimulus with his eyes during one minute trials.
Findings: One group looks at stimulus; another does not respond. Those that do fixate stimulus respond to it much as do infant chimpanzees. If a moving disc is stopped, fixations on it will continue more if it has been moving for thirty seconds than if it has been moving for eight minutes.
Duration: September 1963-indefinite.
Investigator(s): Gershon Berkson, Ph.D., Research Associate, Illinois State Pediatric Institute, 1640 W. Roosevelt Rd., Chicago, Ill.
Cooperating group(s): Illinois State Department of Mental Health.
Publication: Probably to be submitted to Journal of Comparative and Physiological Psychology or American Journal of Mental Deficiency.

18-S-17 PERCEPTUAL ROTATIONS AND OCULAR-MANUAL LATERALITY IN MENTALLY RETARDED ADOLESCENTS

Purpose: To determine the effect of standard and mixed (or nonestablished) laterality upon perception of rotated symbols; ultimately to relate these factors to reading achievement.
Subjects: 40 male and 20 female educable mental retardates from the full-time academic program at Johnstone Training and Research Center, all measuring below 4th grade reading level.
Methods: Five tests each of handedness and eyedness are used to establish each subject as right-sided, left-sided, mixed, or nonestablished (or any combination of handedness and eyedness among the aforementioned measurements). Four criterion tests measuring perception of numbers, letters, printed words, and manuscript words follow laterality tests which present symbols in various phases of rotation. A standard reading achievement test serves as an additional measurement.
Duration: April-September 1964.
Investigator(s): Rudolph J. Capobianco, Ed.D., Research Scientist, Johnstone Training and Research Center, Bordentown, N. J.
Cooperating group(s): New Jersey State Department of Institutions and Agencies.
Publication: Either a monograph or a series of articles to be presented through American Journal of Mental Deficiency and/or Journal of Educational Psychology.

18-S-18 COMPARISON OF FAMILIAL AND BRAIN INJURED MENTAL RETARDATES' ABILITY TO PERCEPTUALLY DISCRIMINATE ROTATED BENDER VISUAL MOTOR GESTALT DESIGNS

Purpose: To attempt to determine if inability to reproduce Bender designs is primarily related to perceptual difficulty or motor difficulty; to determine whether there is a significant difference in perceptual ability of familial or brain-injured mental retardates, as measured by this instrument.
Subjects: The institutionalized population of mental retardates at Rome State School in the I.Q. range of 50 to 80, male and female, age 12 and older.
Methods: 35mm slides projected on an automated device which allows the patient to match alternative choices by pressing the appropriate key. Every response is reinforced, whether correct or incorrect, to motivate key pressing behavior. Follow-up studies are planned which will make use of the reinforcement of key pressing behavior in a learning situation, when reinforcement will be forthcoming only for correct responses.
Duration: February-December 1964.
Investigator(s): Allen D. Ratzlaff, M.A., Chief Psychologist, Rome State School, Rome, N. Y. (Reported by Charles Greenberg, M.D., Director, Rome State School.)

18-S-19 PREDICTIVE VALIDITY OF FIVE TESTS WITH MENTALLY RETARDED CHILDREN

Purpose: To compare and evaluate the predictive validity of the Stanford-Binet, Pictorial Test of Intelligence, Peabody Picture Vocabulary Test, Progressive Matrices, and Illinois Test of Psycholinguistic Abilities, in terms of a broadly defined criterion of demonstrated learning ability.

Subjects: Approximately 100 educable mentally retarded children, approximately 7 to 11 years of age.

Methods: All predictor and criterion measures will be submitted to a correlational analysis, and magnitude of correlations of various predictors with criterion score compared.

Duration: May 1964-April 1965.

Investigator(s): Max W. Mueller, Ph.D. Candidate, George Peabody College for Teachers, Nashville 5, Tenn.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Publication: Data will be available through Cooperative Research Branch, Office of Education.

18-S-20 A COMPARISON OF THE STANFORD-BINET L-M AND WISC WITH EDUCABLE RETARDATES

Purpose: To compare I.Q.'s of educable retardates as measured by 1960 revision of the Stanford-Binet Intelligence Scale and by Wechsler Intelligence Scale for Children.

Subjects: 50 white, educable, mentally retarded pupils (29 boys, 21 girls) in special classes, C.A.'s between 8.6 and 14.6 years with a mean C.A. of 12.2 years.

Methods: During annual routine re-evaluation of special class pupils, the WISC and Stanford-Binet L-M were administered to each in a counterbalanced order.

Findings: Stanford-Binet L-M I.Q.'s compare favorable with WISC V and FS I.Q.'s when used with educable mentally retarded 12 year olds.

Duration: November 1962-February 1963.

Investigator(s): John J. Pastovic, M.S., Psychologist, Clinton and Union County Boards of Education, Court House, Lock Haven, Pa.

Publication: Information is available by direct correspondence with investigator.

18-S-21 PATTERNS OF INTELLECTUAL FUNCTIONING AMONG CRMD STUDENTS

Purpose: To evaluate types of intellectual abilities among CRMD students; to test hypotheses concerning differences between "trainable" and "untrainable" mental defectives matched for Binet I. Q.

Subjects: 60 CRMD students, aged 8 to 12 years, in the New York City Public Schools, 30 classified as "educable" (Track 1), and 30 as less "educable" (Track 2) on the basis of their performance in classes.

Methods: A series of intellectual subtests (collectively called the "DIT") are being given to each subject. Results for each CRMD group will be compared for the subtests and for groups of subtests previously identified as reflecting different intellectual factors.

Duration: May-November 1964.

Investigator(s): Stephen A. Karp, Ph.D., Assistant Professor, and Norma L. Konstadt, B.A., Assistant Instructor, Department of Psychiatry, Downstate Medical Center, State University of New York, Brooklyn 3, N. Y.

Cooperating group(s): New York State Department of Mental Hygiene.

Publication: Ultimate publication is planned. Results, when obtained, will be made available upon request to S. Karp, Sinai Hospital of Baltimore, Maryland.

18-S-22 CORRELATIONAL STUDY OF I.Q. ESTIMATES OF MENTALLY RETARDED CHILDREN

Purpose: To ascertain the extent of agreement among estimates made by pediatrician, speech pathologist, psychologist, and parents of the developmental level of suspected retardates.
Subjects: Children between 1 and 12 who were referred to a mental retardation evaluation clinic.
Methods: All estimates were converted into standard scores. Correlation coefficients were run to measure degree and direction of estimates.
Findings: Data reveal very high agreement among professionals (correlations range from .749 to .863). Parental-professional agreement is also high (.634 to .776), although parents tend to overestimate the developmental level of their children. Highest agreement among judges tends to occur at the extremes of developmental level.
Duration: April 1963-February 1965.
Investigator(s): Richard A. Kurtz, Ph.D., Assistant Professor of Medical Sociology, Nebraska Psychiatric Institute, College of Medicine, University of Nebraska, Omaha, Nebr.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Articles to be submitted to professional journals.

18-S-23 THE HETEROGENEITY OF INTELLECTUAL FUNCTIONS IN THE MENTALLY DEFECTIVE AND ITS INFLUENCE IN THE PREDICTION OF ACADEMIC AND VOCATIONAL ADJUSTMENT

Purpose: To design and evaluate analytic or "factor pure" tests both for the assessment of intellectual functioning of mental defectives and for predicting their success on the job and in school.
Subjects: Two groups of mental defectives, 20 subjects per group, of significantly different I.Q.'s as measured by the better known global tests of intelligence.
Methods: Comparison of vocational and educational output of the two groups.
Findings: Differences in academic and vocational productivity of the two groups were not as great as expected from intelligence test data. Test scatter proved more useful in predicting educational and vocational achievement of mental defectives than the I.Q. score. Consequently, it appears that analytic rather than synthetic tests would be more useful both for assessment and for prediction of success in school and on the job.
Duration: July 1963-November 1964.
Investigator(s): Nicholas J. Kopatic, M.A., Clinical Psychologist, Vineland State School, Vineland, N. J.

18-S-24 AN EXPERIMENTAL INVESTIGATION OF THE EFFECT OF STIMULUS COMPLEXITY ON RESPONSE VARIABILITY OF MENTALLY RETARDED CHILDREN

Purpose: To establish in objective and quantified terms the effects which occur when retarded children are required to respond to essentially the same information organized at different levels of complexity.
Subjects: Approximately 400 children, ages 6 to 18, from a variety of sections of the United States, in public school classes for educable and trainable retarded and in regular first grade classes.
Methods: All subjects are given a one-item per page test (level of simplest complexity) and a second test, one week later, containing the same information as Test I, but varying from 1 to 18 in number of items per page. The Metropolitan Achievement Test, Primary I Form A, was basis for test.
Findings: Preliminary analysis suggests a complexity effect on at least some of the mentally retarded children.
Duration: February 1964-February 1965.

Investigator(s): Ruth Ann Davy O'Keefe (Doctoral Candidate, American University), Project Director, Institute of Educational Research, 2226 Wisconsin Ave., N. W., Washington, D. C. 20007.
Publication: Lithograph by Institute of Educational Research.

18-S-25 CODING BEHAVIORS IN THE MENTALLY RETARDED

Purpose: To investigate coding processes in the retarded, involving transformations of stimulus information from one modality to another; to study effect of verbal processes as a mediating step in coding behavior.
Subjects: An initial study utilized 54 mildly (educable) retarded adolescents.
Methods: Stimulus information was administered by various modalities (auditory, kinesthetic, verbal), and response was made either by tapping a key or by a verbal translation of signal. Task requirement was to imitate a four unit Morse code signal. Uni-modal versus cross-modal translations were compared.
Findings: Most efficient imitation occurred when a verbal signal was translated to a verbal response; least efficient condition for accurate imitation involved administration of a signal by tapping subjects finger and asking him to respond by tapping. Verbal-motor and motor-verbal translations were accomplished with intermediate degrees of accuracy with no significant differences between verbal to motor or motor to verbal arrangements. Results were related to findings by Luria of a "dissociation" between verbal and motor systems of behavior and to recent coding studies of Hermelin and O'Connor, 1963.
Duration: October 1963-indefinite.
Investigator(s): Marvin Rosen, Ph.D., Director of Psychology, and Marvin Kivitz, Ph.D., Director of Training, Elwyn School, Elwyn, Pa.
Publication: Initial and subsequent study to be submitted to American Journal of Mental Deficiency.

18-S-26 KENT-ROSANOFF NORMS FOR RETARDATES

Purpose: To determine Kent-Rosanoff norms for an institutionalized retarded population.
Subjects: About 1000 residents of Dixon State School, aged 10 and above.
Methods: Regular Kent-Rosanoff word association procedure done on an individual basis.
Duration: July 1964-June 1965.
Investigator(s): Rolland Metzger, Ph.D., Psychologist III, Dixon State School, Dixon, Ill.
Publication: To appear in American Journal of Mental Deficiency.

18-S-27 PAIRED-ASSOCIATE LEARNING IN RETARDED CHILDREN

Purpose: To investigate mediating responses utilized by retarded children and adolescents in paired-associate learning; to contribute thereby to a more precise understanding of the relationships between language and cognition in the development of normal and mentally retarded persons.
Subjects: Normal and educable retarded children at M.A. levels 6 to 12 attending regular and special education classes of schools in the greater Washington area; educable and trainable mentally retarded residents of District Training School with M.A. 6 to 10 for former and 3 to 6 for latter group.
Methods: Paired-associate lists varying pictures versus words as stimuli and responses; varying the associative strength of stimulus and response pair members; three stage mediation paradigms with combinations of verbal and pictorial elements.

Duration: January 1964-December 1966.
Investigator(s): Norman A. Milgram, Ph.D., Associate Professor of Psychology, Catholic University of America, Washington 17, D. C.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be published in suitable child experimental and retardation journals as findings emerge.

18-S-28 NEUROPHYSIOLOGICAL AND PERSONALITY BASIS OF LEARNING IN EARLY CHILDHOOD

Purpose: To study learning in committed retarded subjects, with a view to increased effectiveness of medical education; to adapt principles underlying a child's natural learning to speak to affective, rhythmic (musical), mathematical, writing, and reading skills. Mastery of the tools of such communication, possible by age five, will permit use of tools to begin in early grade school with consequent speeding up and increased efficiency of education and enhanced fulfillment of personality potential.
Subjects: Committed retarded plus 2 "retarded-deaf" patients in Carl and Caroline Swanson Clinic for Children, Nebraska Psychiatric Institute.
Methods: Direct work with children and adolescents; development of self-correction as natural feedback, by keeping from external criticism; supplying pattern of action, leaving child free to copy or vary from it; facilitation of cross-reference of sense modalities; hypothetical reconstruction of sequence of natural learning and trial of experiences in changed order; always in beginning learning, working from concrete toward abstract until child can make own abstractions and reason for himself.
Investigator(s): Leslie A. Osborn, M.D., Professor, Department of Neurology and Psychiatry, College of Medicine, University of Nebraska, Omaha, Nebr., and Gwen Arnold Osborn, Ph.D., formerly Associate Professor of Special Education, University of Wisconsin, Madison, Wis.
Publication: Paper delivered at Copenhagen Congress on Scientific Study of Retardation, August 1964.

18-S-29 "LEARNING POTENTIAL" AMONG THE EDUCABLE RETARDED

Purpose: To investigate the validity of a novel assessment approach to the retarded. Basic thesis is that when high grade retardate is given opportunity to learn how to perform on a nonverbal reasoning task, through medium of a systematic training experience (coaching), they would learn how to solve the specific reasoning task.
Subjects: Mildly and moderately retarded adolescents in institutions and in the community.
Methods: Kohs Block Design Test will be reasoning task. Subjects will be followed for a period of one or two years after discharge from special institutional care into supervised placements.
Duration: 1963-1966.
Investigator(s): Milton Budoff, Ph.D., Assistant Professor of Psychology, University of Massachusetts, Amherst, Mass.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-S-30 PERSONALITY AND SUCCESS PROFILES CHARACTERISTIC OF YOUNG MALE RETARDATES

Purpose: To obtain, through statistical analysis of the 17 obtained success factors, "success" groups which have been found to characterize major types of effective or ineffective performance among adult male retardates; to relate

personality and cognitive characteristics ("factors in persons") to particular "success" syndromes.
Subjects: 25 mentally retarded male youths were randomly drawn from each of the following situations: (1) graduates of Marbridge Foundation; (2) graduates of state school habilitation classes; (3) graduates of South Texas Habilitation Center's vocational training program; and (4) graduates of special education classes of public high schools in Texas communities.
Methods: (1) Cluster profiles of success; criterion measures now in form of "factors in persons"; and (2) prediction of profile group membership from personality characteristics (predictor factors).
Duration: May-August 1964.
Investigator(s): John R. Peck, Ph.D., Associate Professor of Educational Psychology, University of Texas, Austin, Tex. (Reported by Will Beth Stephens, Research Associate, Department of Educational Psychology, University of Texas.)
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report to be submitted to Office of Education; an article to be submitted to professional journals.

18-S-31 SOME FACTORS INVOLVED IN ACCURACY OF PARENTAL ESTIMATE OF MENTAL AGE FOR CHILDREN SEEN AS MENTALLY RETARDED

Purpose: To evaluate some of the variables related to parents' assessment of their child's level of intellectual operation.
Subjects: Children and parents referred to Child Development Center.
Methods: Correlations will be made: (1) between measured and estimated mental ages; (2) for Vineland social age and mental age estimates and assessments; and (3) for both mothers and fathers according to family size, education, and sex of child.
Findings: Mothers in all classifications were significantly more accurate than fathers. "Best" estimators were mothers with more than eight years of education evaluating their daughters. Father's estimates were more closely related to "social age" than mental age; reverse was true of mothers.
Investigator(s): Ronald Ebinger, Ph.D., Clinical Psychologist, Child Development Center, 406 South Cascade, Fergus Falls, Minn.

18-S-32 GENETIC COUNSELING PROBLEMS IN CYTOGENETIC DISORDERS

Purpose: To investigate methods of family counseling in relation to types of cytogenetic diseases; to investigate cytogenetic disorders, expecially mosaicism, for their need of genetic counseling procedures.
Subjects: Children and families of children having:

- (1) Down's disorder (Mongolism, paramongolism)
  - a. Trisomy 21
  - b. Translocation 21
  - c. Mosaic 21
- (2) Klinefelter's Syndrome
  - a. nondisjunctional
  - b. mosaicism
- (3) Turner's Syndrome
  - a. nondisjunctional
  - b. mosaicism

Methods: (1) Classical investigations into psychodynamics of the family milieu with emphasis on the use of karyograms and other tangible data; (2) group therapeutics with emphasis on discussion and participation in the laboratory procedures (karyogramming); and (3) analysis of reproduction within kindreds prior to birth of the child, prior to counseling, and following counseling, for analysis of the simple projective testing of emotional prob-

lems before and after counseling.
Findings: Parents of Mongoloid children and the parents' siblings have been found to have marked decline in reproduction after birth and diagnosis of the affected child, which has resulted from the severe emotional disturbances stemming from suspected hereditary factors. Counseling aims at delineating these emotional stresses for their eventual alleviation. It is anticipated that effectiveness of counseling procedures can be measured on the basis of reproductive changes in the kindred.
Duration: August 1963-August 1968.
Investigator(s): Robert L. Tips, M.D., Ph.D., Division Head, Biochemical Genetics Division, Houston State Psychiatric Institute, Houston, Tex.
Cooperating group(s): Irvin A. Kraft, M.D., Director, Clinical Division of Child Psychiatry, Houston State Psychiatric Institute.
Publication: Eugenics Quarterly 9:237-240, 1962; Journal of the American Medical Association 184:183-186, 1963; American Journal of Mental Deficiency 68:334-339, 1963; American Journal of Diseases of Children 107:67-72, 1964.

18-S-33 DEMOGRAPHIC STUDY OF MENTALLY RETARDED PATIENTS ADMITTED TO BEATRICE STATE HOME

Purpose: To study trends in admissions to, and separations from, a home for the mentally retarded for a 50 year period.
Subjects: All admissions to, and separations from, Beatrice State Home during the period 1910-1960.
Methods: An examination of admissions in general and an analysis of differentials by age and sex. For an understanding of separation experience, all admissions are traced through time to determine whether they have been separated, and the type of separation.
Findings: The number of admissions has been increasing but the data reveal a severe year-to-year fluctuation pattern. In 38 of the 50 years, male admissions outnumbered females. The data reveal pronounced numerical and proportional increases in the younger age groupings.
Duration: October 1963-April 1965.
Investigator(s): Richard A. Kurtz, Ph.D., Assistant Professor of Medical Sociology, Nebraska Psychiatric Institute, College of Medicine, University of Nebraska, Omaha, Nebr.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Articles will be submitted to professional journals.

18-S-34 TRAINING RETARDED CHILDREN TO ENHANCE A FUNCTIONING GRASP SKILL

Purpose: To develop methods and materials for structuring the training of young retarded children to enhance a functioning grasp skill.
Subjects: Trainable retarded children, 3.6 to 8 years old, attending Orchard School; matched group of normal preschool children, attending National College of Education.
Methods: Direct observations, motion pictures, still picture of spontaneous actions and structured situations involving grasp. Interpretations of material and implications for teaching by a psychologist and team of preschool teachers, physical therapists and an orthopedic surgeon.
Duration: 1964-1966.
Investigator(s): Calvin K. Claus, Ph.D., Psychological Consultant, Orchard School and Instructor, National College of Education, Evanston, Ill.; and Julia S. Molloy, M.A., Director, Orchard School for Retarded Children, Skokie, Ill.
Cooperating group(s): Ben Levin Memorial for Retarded Children.

18-S-35 SOCIAL-PERCEPTUAL TRAINING OF RETARDED ADOLESCENTS

Purpose: To improve the social perceptions, inferences, and, most essentially, the behaviors of mentally retarded adolescents in social situations; to develop and test experimental procedures for training in social-perceptual skills.

Subjects: Four classes of mentally retarded junior high school pupils and four vocational training classes of residential (state institutionalized) retardates will be involved in the evaluation of a training program; two classes of both public school and of residential retardates will serve as disguised controls.

Methods: Experimental training procedures will be evaluated in terms of a pair of control studies permitting pre- and post-training measurement of social-perceptual acuity and interperson behaviors of all subject groups. Measures of social-perceptual acuity are to be derived from a standardized presentation of picture stimuli covering a wide range of social situations pertinent to retarded youth.

Duration: January 1964-December 1966.

Investigator(s): Barbara Edmonson, M.A., Research Associate, Children's Rehabilitation Unit, Medical Center, University of Kansas, Kansas City, Kans.

Cooperating group(s): Children's Rehabilitation Unit, University of Kansas Medical Center; Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

Publication: To be submitted for journal publication.

18-S-36 A PROGRAM OF GRADUATED HABILITATION OF MENTALLY RETARDED YOUTH FROM INSTITUTIONAL TO COMMUNITY LIVING

Purpose: To closely observe a sample of male students going through process of moving from an institutional environment to an independent living situation; to gain better appreciation of this adjustment process experienced by retarded individuals; to permit more critical determination of students requiring supplementary assistance in process through resources on campus and those off campus.

Subjects: A limited sample of male retardates.

Methods: Half of subjects will be afforded a "stepping stone" between institution and community via the halfway house. A comparable group will remain in institution until placement is effected; then, each individual will move directly into community.

Duration: July 1963-1966.

Investigator(s): Joseph J. Parnicky, Ph.D., Superintendent, Neale L. Peterson, M.S., Vocational Supervisor, Harris Kahn, Ph.D., Principal Psychologist, Phyllis E. Plequette, M.S.S.S., Director of Social Service, and Herman H. Spitz, Ph.D., Research Associate, Edward R. Johnstone Training and Research Center, Bordentown, N. J.

Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

18-S-37 FOSTER HOME CARE FOR THE MENTALLY RETARDED

Purpose: To evaluate effectiveness and present use of foster homes for the mentally retarded.

Subjects: Retardates to be chosen from Connecticut.

Methods: Ex post facto design using matched pairs, one member institutionalized and one placed in foster home.

Duration: June 1964-June 1966.

Investigator(s): J. Raymond Pichey, M.S.W., Assistant Professor, School of Social Work, University of Connecticut, Hartford 5, Conn.

Cooperating group(s): Kennedy Center, Bridgeport; Office of Mental Retardation, Hartford, Conn.

BEST COPY AVAILABLE

18-S-38 VOCATIONAL INTEREST AND SOPHISTICATION ASSESSMENT

Purpose: To permit further development of the validity and reliability of an experimental picture test of vocational interest and sophistication (VISA) which was evolved as a portion of a prior project supported by the Vocational Rehabilitation Administration (Bulletin 11, Research Relating to Children). Methods: Development of test was carried to point of determining its capacity to discriminate job preferences of retarded youth and its validity and reliability for a sample drawn from Johnstone Training Center. Investigations in present project will be pursued with additional retarded populations in a range of settings in order to establish applicability of VISA as a predictive device in vocational habilitation of both institutionalized and noninstitutionalized retardates.
Duration: July 1963-not reported.
Investigator(s): Joseph J. Parnicky, Ph.D., Superintendent, Arthur J. Burdette, M.S., Psychologist, Harris Kahn, Ph.D., Principal Psychologist, Herman H. Spitz, Ph.D., and Neale L. Peterson, M.S., Vocational Supervisor, Edward R. Johnstone Training and Research Center, Bordentown, N. J.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

18-S-39 VALIDATION OF THE VOCATIONAL CAPACITY SCALE UTILIZING INSTITUTIONALIZED RETARDATES

Subjects: All residents, 15 years and older, presently enrolled at Sunland Training Center at Marianna, a state residential institution for mentally retarded. Subjects consist of educable, trainable, and profoundly retarded residents.
Methods: The Vocational Capacity Scale (VCS) developed by MacDonald Training Center will be utilized. This instrument is made up of eight separate tests arranged to be administered in evaluation settings for purpose of predicting vocational potentialities of retarded young adults. Present and new residents, age 15 and above, will be evaluated with VCS. At end of one year in training-work program, all residents will be re-evaluated with VCS.
Duration: July 1964-June 1967.
Investigator(s): Maurice Dayan, Ed.D., Director of Psychological Services, Sunland Training Center, Marianna, Fla.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: To be published in a professional journal or in report form to Vocational Rehabilitation Administration.

Physically handicapped

18-T-1 PERSONALITY DEVELOPMENT IN CHRONIC HANDICAPPING DISEASES OF CHILDREN

Purpose: To investigate the influence of certain congenital, chronically handicapping conditions on development of young children and their families; to delineate some of the factors which determine nature of that influence.
Subjects: Study will include 120 children who will be drawn equally from four diagnostic categories: sickle cell anemia, cystic fibrosis, congenital heart disease, and congenital amputation. The four groups of 30 children each will be matched for age (with age range being from under 1 year through 8 years), sex, race, and socio-economic class, and will be drawn from patient populations at Children's Hospital of the District of Columbia and the Crippled Children's Unit of the District of Columbia General Hospital.
Methods: Parents of children, including father where possible, will be

evaluated by both a social worker and a psychiatrist, while the children will be independently evaluated by a second psychiatrist and a developmental psychologist. In each case the referring physician will provide an independent assessment of the severity of the child's physical condition.
Duration: October 1962-October 1967.
Investigator(s): Reginald S. Lourie, M.D., Director, Department of Psychiatry, Children's Hospital of the District of Columbia, and Samuel Schwarz, M.D., Director, Bureau of Maternal and Child Health, District of Columbia Department of Public Health, Washington, D. C. (Reported by Mary E. Robinson, Ph.D., Project Director, Research Foundation, Children's Hospital of the District of Columbia.)
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Individual research team members plan to publish papers in appropriate professional journals on particular aspects of procedure and research finding. At completion of study all team members will cooperate in the production of a monograph or book concerned with overall results of the study.

18-T-2 MORALE OF HANDICAPPED CHILDREN

Purpose: To develop a scale for measuring children's morale; to determine some correlates of differential morale among institutionalized handicapped children.
Subjects: 160 children in residence at Institute of Logopedics, Wichita, Kansas, ages 3 to 25 (median about 11 years), median I.Q. 58; representing wide variety of speech and neurological handicaps of all degrees of severity.
Methods: Nine-item Guttman scale involving behavioral traits of children presumed to be positive or negative indicators of morale. Subjects evaluated by housemothers in close day-to-day contact with child.
Findings: Scale met criteria for Guttman scalogram model, correlated positively with judgments of children's morale by preceptors and classroom teachers. For curvilinear relationship between morale and I.Q., morale was lowest among severely retarded and those with near normal I.Q., and highest among "middle range" subjects (40 to 60 I.Q.). No difference concerning sex, diagnosis of handicap, or length of time in institution. Analysis of other variables in process.
Duration: November 1963-January 1965.
Investigator(s): Harry R. Dick, Ph.D., Associate Professor of Sociology, University of Wichita and Institute of Logopedics, Wichita, Kans.
Publication: Paper on nature and development of scale submitted for publication; paper on correlates of morale in process.

18-T-3 GENETICS OF CHILDREN'S DISEASES

Purpose: To evaluate genetic and prenatal factors in children's diseases, particularly malformations.
Methods: Family histories; appropriate diagnostic tests.
Duration: 1950-1985.
Investigator(s): F. Clarke Fraser, M.D., Professor, Human Genetics Sector, Department of Genetics, and Director, Department of Medical Genetics, Montreal Children's Hospital, McGill University, Montreal 2, Que.
Cooperating group(s): Department of National Health and Welfare; Medical Research Council; National Research Council (Canada); National Foundation; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: American Journal of Human Genetics 16:1, 1964; Plastic and Reconstructive Surgery 33:395, 1964.

18-T-4 STUDY OF THE THALIDOMIDE CHILD

Purpose: To investigate the developmental potential of the thalidomide child from the affective and intellectual point of view.
Subjects: 33 children born between January 1961 and December 1962, most suffering from congenital anomalies of the extremities.
Methods: (1) Intellectual evaluation: the Griffiths Developmental Scale, Piaget's Scale of Object-Concept, and Haeussermann's Developmental Potential of Preschool Children; (2) affective evaluation: Gouin-Decarie's Scale of Object-Relationship.
Duration: January 1964-April 1966.
Investigator(s): Therese Gouin-Decarie, Ph.D., Associate Professor of Psychology, University of Montreal, Montreal, Que.
Cooperating group(s): Montreal Institute of Rehabilitation.
Publication: Results to be published, probably in Canadian Journal of Psychology.

18-T-5 THE FREQUENCY OF THE INCIDENCE OF CEPHALOFACIAL BIRTH DEFECTS

Purpose: To determine frequency of the incidence of birth defects among American Negro children.
Subjects: 80,000 birth records of American Negro children at two hospitals in the District of Columbia.
Methods: Mass survey; statistical analysis; comparison with similar studies.
Findings: (1) There are racial and socio-economic differences in frequency of total incidence in general and local (head and face) birth defects; (2) there are differences in types of defects; and (3) fewer American Negro children have cleft lip and/or cleft palate.
Duration: October 1962-July 1964.
Investigator(s): Leonard A. Altemus, D.D.S., Associate Professor of Orthodontics, College of Dentistry, Howard University, Washington, D. C.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Presented to and accepted as thesis by American Board of Orthodontics, May 1964. To be published in pediatric, cleft palate and orthodontic journals.

18-T-6 ANATOMICAL AND PHYSIOLOGICAL STUDIES OF PHARYNGEAL ACTIONS IN INFANTS AND CHILDREN HAVING CLEFT PALATE AND/OR OTHER ANOMALIES OF THE PHARYNGEAL REGION

Duration: 1961-indefinite.
Investigator(s): James F. Bosma, M.D., Chief, Oral and Pharyngeal Development Section, National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.

18-T-7 DIAGNOSTIC AND PROGNOSTIC TECHNIQUES IN CLEFT PALATE

Purpose: To identify and validate criteria to be used in making management decisions in the habilitation of individuals with cleft palates.
Subjects: Newborns through individuals not more than 18 years, born with a cleft lip and/or palate and referred to the Department of Otolaryngology and Maxillofacial Surgery at the University of Iowa for care.
Methods: Extensive descriptions of all new patients by the surgeon, orthodontist, prosthodonist, speech pathologist, otologist, audiologist, clinical psychologist and medical social worker are made during patient's initial visit. These examinations are repeated at regular, prescribed intervals as the patient

proceeds through course of treatment. Premanagement evaluations are studied in light of postmanagement success to determine which observations, if any, had predictive value.
Duration: June 1963-indefinite.
Investigator(s): Duane C. Spriestersbach, Ph.D., Professor of Speech Pathology, State University of Iowa, Iowa City, Iowa.
Cooperating group(s): National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Results will be published as they become available in such journals as *The Cleft Palate Journal*, *Plastic and Reconstructive Surgery*, *Journal of Speech and Hearing Research*, *Angle Orthodontist*, etc.

18-T-8 CINERADIOGRAPHIC EVALUATION OF PROSTHETIC SPEECH AID

Purpose: To determine the size, shape, and location of prosthetic speech aid which would offer maximum voice quality improvement.
Subjects: 10 teenage white male and female subjects with nonoperated cleft of soft and hard palate and no cleft of lip or alveolus ridge. All subjects were tested or judged as having good speech, normal hearing, average or above mental ability.
Methods: Cineradiographic study of original speech bulb and a repeat study for each of three locations and dimensional changes. Effects of speech bulb location and dimensional changes were noted by sound spectrographic analysis and independent judgments by trained "listener" technique. Position of speech bulb varied above, below, and on the area of muscle constriction located on posterior wall of pharynx.
Findings: When speech bulb was located on area of greatest posterior wall activity, voice quality was considered to be socially acceptable -- the criterion used for normal speech. Size of speech bulb was reduced to one-fourth original size without apparent change in voice quality. When bulb was located below area of pharyngeal wall activity, voice quality was hypernasal. When speech bulb was located above appointed area, voice quality was rated as slightly nasal.
Duration: April 1963-April 1964.
Investigator(s): M. Mazaheri, D.D.S., M.Sc., Chief of Dental Services, and Robert T. Millard, M.A., Director of Speech and Hearing, Lancaster Cleft Palate Clinic, Lancaster, Pa.
Cooperating group(s): Pfeiffer Foundation; National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be published in *The Cleft Palate Journal*; paper read before American Cleft Palate Association, Los Angeles, April 1964.

18-T-9 A PRELIMINARY STUDY OF METHODS FOR EVALUATING THE SPEECH AND RELATED BEHAVIOR CHANGES WHICH ACCOMPANY THERAPY PROGRAMS FOR ORAL CLEFT PATIENTS

Purpose: To evaluate changes between pre- and post-therapy speech recordings of oral cleft patients in order to relate objective and subjective measures of speech in such a way that an index or indices of social adequacy of speech may emerge.
Subjects: Clinical cases drawn from cleft palate children seen at University of Michigan Speech Clinic and Speech Improvement Camp during summer session of 1964.
Methods: Recorded speech samples will be obtained by having patients with postoperative oral clefts read selected sentences and word lists at the outset of therapy and at weekly intervals thereafter until completion of therapy. Objective measures of pre- and post-therapy recordings will be made by use of sound spectrograph and listeners' identification of the words and sentences.

Subjective measures utilizing value judgments along predetermined scales will be correlated with objective measures. Palatopharyngeal, oral motor, sociometric and psychometric measures also will be compared; a follow-up study of speech will be compared with the results obtained from both pre- and post-therapy speech samples.
Duration: June 1964-May 1965.
Investigator(s): H. Harlan Bloomer, Ph.D., Professor and Director, and T. David Prins, Ph.D., Assistant Professor, Speech Clinic, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: *Journal of Speech and Hearing Disorders*; *Journal of Speech and Hearing Research*; and associated publications.

18-T-10 CORRECTION OF MAXILLARY ARCH ASYMMETRIES ASSOCIATED WITH CONGENITAL CLEFTS OF THE PALATE

Purpose: To reduce the problems associated with osseous deformities associated with congenital clefts of the palate.
Subjects: Children of all ages, with particular emphasis on older, neglected cases.
Methods: Intraoral devices planned to properly orient the maxillary alveolar arch to the mandibular arch are designed and utilized. Following correction, relationship between involved segments is maintained by bone grafting across clefts.
Findings: Preliminary efforts indicate promising possibilities.
Duration: May 1962-not reported.
Investigator(s): Herbert Conway, M.D., Professor and Attending Plastic Surgeon, and Dicran Goulian, Jr., M.D., D.D.S., Assistant Professor and Assistant Attending Surgeon, The New York Hospital, Cornell Medical Center, New York, 21, N. Y.
Cooperating group(s): Altman Foundation; New York City Society for Crippled Children and Adults.
Publication: *Annals of Surgery*, 158:431-439, 1963.

18-T-11 EFFECT OF ORAL ORTHOPEDICS PRECEDING REPAIR OF CLEFT LIP

Purpose: (1) To develop a method of extra-oral therapy in which widely deranged maxillary segments of a cleft lip-cleft palate deformity are reoriented presurgically into a near ideal arch form; (2) to study longitudinally the growth and development of the cleft palate and the so-called normal palate; and (3) to explore development of orthodontic methods and devices for treating malocclusions in deciduous, mixed, and adult dentition stages as they relate to cleft palate patient.
Subjects: Initially, study was concerned with infants having severe clefts of the lip and palate. Presently, all cleft lip and cleft palate patients coming to Babies' Unit Hospital are included.
Methods: Dental orthopedics conducted by extra-oral forces developed by investigator. Longitudinal growth and development studies of cleft palate child in general and the cranio-facial complex in particular are conducted by usual methods of anthropometry, cephalometric roentgenography, dental casts, photography, and intra-oral roentgenography. Records collected prior to and following surgical procedures. Orthodontic methods and devices, developed by investigator, are explored and compared to conventional orthodontic procedures.
Findings: Dental orthopedics by extra-oral means has been demonstrated. All subjects responded to therapy. Growth and development of maxillary segments has been demonstrated, further supporting need for extra-oral therapy as method of choice. New methods of diagnosis, principles of lip surgery, and orthodontic

appliances have been demonstrated.
Duration: June 1961-continuing.
Investigator(s): Michael B. Collito, D.D.S., M.S., Project Director, Babies' Unit Hospital, United Hospitals of Newark, 15 Roseville Ave., Newark, N. J. 07107.
Cooperating group(s): National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-T-12 THE MEASUREMENT AND RETRAINING OF TONGUE-THRUSTING

Purpose: To develop an oral radiosonde device capable of detecting abnormal tongue pressures; to employ the emitted signal from an oral radiosonde to modify abnormal tongue habits.
Subjects: Children, 5 to 12 years, suffering from distortions of the oral arch attributable to tongue-thrusting.
Findings: Thus far, an experimental radiosonde has been produced and is ready for clinical trials.
Duration: September 1963-April 1966.
Investigator(s): Bruce Quarrington, Ph.D., Associate in Psychiatry and Associate Professor of Psychology, University of Toronto, Toronto, Ont.
Cooperating group(s): Laidlaw Foundation, Toronto.

18-T-13 ORAL DIADOKOKINESIS IN ABNORMAL SPEECH AND DEGLUTITION

Purpose: To identify diadokokinesia, or more specifically, dysdiadokokinesia, as a significant factor in the symptom complex found in certain disorders of speech and deglutition.
Subjects: Individuals at selected age levels from 3 to 21 years.
Methods: Utilization and experimentation with various methods of data collection will involve 16mm photography, electromyography, cine-radiography, and acoustic spectrographic analysis in order to establish a reliable, more easily obtainable procedure for data collection. Information will then be obtained pertaining to the patterning and quantification of oral diadokokinesis in normal individuals; this data will then lead to collection of information from individuals with known physical and functional disorders.
Duration: January 1964-December 1967.
Investigator(s): H. Harlan Bloomer, Ph.D., Professor and Director, Speech Clinic, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal of Speech and Hearing Disorders; Journal of Speech and Hearing Research; and associated publications.

18-T-14 ORAL AND WRITTEN WORD ASSOCIATION RESPONSES IN STUTTERING AND NONSTUTTERING CHILDREN

Purpose: To examine the differences between oral and written responses in terms of type, latency, and subjects.
Subjects: Stuttering and nonstuttering children.
Methods: Administration of revised Kent-Rosanoff words.
Duration: June 1964-January 1965.
Investigator(s): Henry Goehl, Ph.D., Assistant Professor of Speech, Temple University, Philadelphia 22, Pa. (Reported by Murray M. Halfond, Ph.D., Director, Speech and Hearing Center, Temple University.)
Publication: To be submitted to Journal of Speech and Hearing Research.

18-T-15 PSYCHOLINGUISTIC STUDIES OF PRESCHOOL CHILDREN

Purpose: To develop a battery of language and speech tests which can be used in future studies of children with delayed speech and language development, including populations of autistic, brain-damaged, cleft palate, and cerebral palsied children.

Subjects: Data are presently being collected on normal subjects, from birth to 6 years of age.

Findings: Patterns of development of over-inclusion and exclusion of word meaning and articulation skill can be determined for comparison with similar data on abnormal populations.

Duration: 1964-indefinite.

Investigator(s): Kenneth R. Bzoch, Ph.D., Head, Department of Communicative Disorders, Teaching Hospitals and Clinics, University of Florida, Gainesville, Fla.

Cooperating group(s): Medical and Psychology staff at J. Hillis Miller Health Center, University of Florida.

18-T-16 LANGUAGE BEHAVIOR OF NORMAL-SPEAKING AND ARTICULATION-PROBLEM CHILDREN

Purpose: To compare the ability of normal-speaking with articulation-problem children to recall and reverse words and word associations.

Subjects: Two groups, each consisting of 50 children from 5 to 8 years of age. One group consisted of normal-speaking children, the other of articulation-problem children.

Methods: For recognition and recall, five categories of word pairs including numbers and letters, words from like parts of speech, and variations in grammatical structure were used. The word association section employed 54 words, nine words from each of five parts of speech.

Findings: No differences indicated according to word-pair categories on reversal task, but articulation-problem children's scores were significantly lower than normals'. Word associations were better for normal children and were correlated with increased age.

Duration: March-August 1964.

Investigator(s): Robert W. Peters, Ph.D., Director, Speech and Hearing Center, University of Southern Mississippi, Hattiesburg, Miss.

Publication: To be submitted for journal publication.

18-T-17 DEVELOPMENT OF ENGLISH MORPHOLOGICAL RULES AND RECOGNITION OF SPEECH SEGMENTS BY FIVE- TO EIGHT-YEAR OLD NORMAL-SPEAKING AND ARTICULATION-PROBLEM CHILDREN

Purpose: To study ability of articulation-problem and normal-speaking children to use morphological rules and to recognize segments of speech framework of a spoken sentence.

Subjects: Two groups, each consisting of 50 children from 5 to 8 years old. One group consists of normal-speaking children, the other of articulation-problem children.

Methods: Sentences are used in which a missing nonsense word is supplied by the child to explore generalization of plurals, past, present, and future tense adjectives, adverbs, superlatives, and possessives. In test for recognition, subjects indicate whether they hear segments of four different lengths taken from sentences and mingled with segments not found in sentences.

Findings: Normal-speaking children scored higher on recognition of speech segments and slightly, but not significantly, better on morphological data than articulation-problem children.

Duration: March-August 1964.

Investigator(s): Robert W. Peters, Ph.D., Director, Speech and Hearing Center, University of Southern Mississippi, Hattiesburg, Miss.

Publication: To be submitted for journal publication.

18-T-18 NANAKULI SPECIAL PROJECT IN HEARING

Purpose: (1) To determine cause of high incidence of hearing loss in fifth grade children in Hawaii. A project carried out from 1957 to 1958 on 1,065 fifth grade children showed a medically significant hearing loss in nine percent of those tested. (2) To throw light on natural history of otitis media--why certain cases of acute otitis fail to resolve, and to explain etiological factors in the different types of chronic otitis media.
Subjects: 154 children below the age of 1 year at time of first examination in 1961, living in area served by Child Health Conference at Nanakuli, Oahu.
Methods: Nanakuli was chosen as it is a fairly typical semi-rural area, having a fairly stable population and a suspected high incidence of middle-ear disease. Beginning January 1961, the ears, noses, and throats of all children in the area were examined at monthly intervals during first year of life. Examination of this group was continued every three months in second and third year; examinations will be continued at six-month intervals to the tenth year. Children can be seen in the event of development of ear symptoms at any time. Annual audiometric studies are carried out at earliest possible age; otologic examination includes ear, nose, throat, and neck.
Findings: Thus far, high incidence of middle-ear disease and medically significant hearing loss in Hawaii's children is established beyond doubt.
Duration: January 1961-indefinite.
Investigator(s): John Watson, M.D., Consultant, Hawaii State Department of Health, Honolulu, Hawaii.

18-T-19 CLINICAL AND EPIDEMIOLOGICAL STUDIES OF HEARING LOSS IN CHILDREN

Purpose: To study early diagnosis and measures which will promote earlier recognition of children at risk, making earlier referral for training possible; to analyze the etiology of subjects' disorders, including a review of subsequent births in many of families first studied in order to investigate possibility of genetic etiology; to assess the incidence of associated abnormalities in the total group of cases and analyze various types which will be related to various etiological groups; and to study problems of unusual clinical interest.
Subjects: 300 preschool deaf children studied over a 10-year period.
Methods: Children received complete investigation, including pediatric, otological, audiological, psychological, genetic, and sociological study. Data will be analyzed with regard to certain epidemiological and clinical considerations.
Duration: April 1964-April 1965.
Investigator(s): G. C. Robinson, M.D., Associate Professor of Pediatrics, and K. G. Cambon, M.D., University of British Columbia, Vancouver, B. C.

18-T-20 VERBAL AND NONVERBAL LEARNING IN CHILDREN, INCLUDING THOSE WITH HEARING LOSSES, PART II

Purpose: To study auditory and visual presentations of rote-learning material in children, with particular emphasis on the hard-of-hearing.
Subjects: Large groups of children in the elementary grades are being used to establish a frame of reference; smaller groups of hearing handicapped children are then studied to search for similarities and differences in their behaviors.
Methods: Meaningful and nonmeaningful material is being used in a paired-associate task in various combinations of auditory, visual, and audio-visual presentations.
Findings: Little data have been tabulated on present project as yet. Previous research on this topic (Bulletin 14, Research Relating to Children) indicates that meaningfulness of the material is a more important variable than sensory channel of presentation.

Duration: September 1963-August 1966.
Investigator(s): John H. Gaeth, Ph.D., Director, Hearing Clinic, Wayne State University, Detroit 2, Mich.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Data will be reported initially in final report for project.

18-T-21 DIAGNOSTIC ASPECTS OF ELECTROENCEPHALIC AUDIOMETRY

Purpose: To analyze evoked responses to repeated auditory stimuli which will be recorded from scalp electrodes by means of an average response computer.
Subjects: Children from birth through 6 years of age with auditory disorders, and some normal-hearing children in same age range.
Methods: Responses will be evaluated in terms of: (1) stimulus parameters; (2) kind and depth of anesthesia; (3) maturational development; (4) nature of auditory disorders and subsequent development in verbal communication. Resultant analysis should yield information which will lead to early and accurate diagnosis of auditory disorders, and to better understanding of central auditory mechanisms. Studies of effects of anesthesia should lead to improved methods of controlling young children during electroencephalic audiometry without invalidating significance of evoked response pattern.
Duration: April 1964-March 1969.
Investigator(s): Robert Goldstein, Ph.D., Director, Division of Audiology and Speech Pathology, Department of Otolaryngology, Jewish Hospital of St. Louis, St. Louis, Mo.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be published in Journal of Speech and Hearing Research or Journal of Speech and Hearing Disorders.

18-T-22 VISIBLE SPEECH FOR THE DEAF

Purpose: To investigate selected determinants of the ability of deaf and severely deafened subjects to substitute vision for defective audition in the acquisition of speech. Project is designed to evaluate subject's ability to differentiate, recognize and produce: (1) patterns of sounds spoken in isolation or with the neutral vowel; (2) patterns of selected common variants of phonemes; (3) patterns of sounds possessing similar kinesthetic perceptual characteristics; and (4) patterns of syllables, words, phrases, and sentences in continuous speech.
Subjects: Students attending upper elementary and intermediate classes at Detroit Day School for Deaf.
Methods: Subjects work with experimenters for four 45-minute class periods per week with instruction during scheduled period. Students are taught sounds through visible patterns in acquisition and control of speech, necessitating utilization of a visio-kinesthetic control or feedback system in place of audio-kinesthetic mechanism used by normal, hearing individuals. The visible speech translator will be used.
Duration: May 1964-1967.
Investigator(s): George A. Kopp, Ph.D., Director, Speech and Hearing Clinic, Wayne State University, and Harriet G. Kopp, Ph.D., Principal, Detroit Day School for Deaf, Detroit, Mich.

18-T-23 VISUAL PERCEPTION IN STRABISMUS

Purpose: To develop an improved understanding of normal binocular vision and of certain disorders of binocular vision, particularly nonparalytic strabismus and amblyopia ex anopsia; to develop improved clinical techniques for the treatment of these disorders.

Subjects: In some experiments, normal binocular individuals are used as subjects; however, most are strabismic and amblyopic patients who have been referred for experimental treatment by practicing ophthalmologists in the Boston area. Most of these patients are children.

Methods: Evaluation of clinical procedures is carried out by treating patients and observing the results. This treatment consists primarily of visual exercises at home on a daily basis. Patients are seen in clinic at intervals of one to four weeks. Psycho-physical experiments, usually employing nonstrabismic observers, are carried out in the laboratory.

Findings: A new theory regarding the nature of the disorder in strabismus and amblyopia has been developed, and substantiating evidence has been obtained and published. New clinical techniques, derived from this theory, have been devised and their efficacy has been demonstrated.

Duration: September 1962-indefinite.

Investigator(s): Samuel C. McLaughlin, M.S., Research Associate, Institute for Psychological Research, Tufts University, Medford, Mass.

Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: American Orthoptic Journal, 9:77-88, 1959; American Journal of Ophthalmology, 48:1:148-153, January 1959; 49:5:132-135, May 1960; Psychological Monographs, in press.

18-T-24 PERINATAL FACTORS ASSOCIATED WITH STRABISMUS IN NEGRO CHILDREN

Purpose: To study perinatal factors associated with strabismus in children.

Subjects: Negro children born in a hospital within the State of Maryland on or after January 1, 1963.

Duration: April 1963-September 1964.

Investigator(s): Maureen Henderson, M.D., Associate Professor of Preventive Medicine, School of Medicine, University of Maryland, Baltimore, Md.

18-T-25 STUDIES OF HYSTERICAL AMBLYOPIA (BLINDNESS) IN CHILDREN

Purpose: To evaluate family interrelationships and dynamics to better understand how this blindness pattern resulted.

Subjects: Three or four children with this disorder and their families.

Methods: Clinical evaluations; treatment by conventional procedures; follow-up studies.

Duration: 1963-1966.

Investigator(s): Irvin A. Kraft, M.D., Chief, Division of Child Psychiatry, Houston State Psychiatric Institute, Houston, Tex.

18-T-26 DIVERGENT THINKING IN BLIND CHILDREN

Purpose: To determine the quality and degree of divergent thinking abilities of totally blind pupils in day and residential schools when compared with visually normal children.

Subjects: 100 blind pupils in residential schools; 100 blind pupils in public day schools; 100 visually normal pupils in public day schools.

Methods: Assessment of the three groups on tests of divergent thinking.

Duration: June 1964-May 1966.

Investigator(s): William J. Tisdall, Ph.D., Assistant Professor, School of

Education, University of Pittsburgh, Pittsburgh, Pa.
Cooperating group(s): Division of Handicapped Children and Youth, Office of Education, U. S. Department of Health, Education, and Welfare.

18-T-27 BEHAVIORAL CHANGES AS A RESULT OF VISUAL TRAINING

Purpose: To measure incidence and nature of behavioral changes resulting from visual training.
Subjects: 10 randomly selected clinical patients, 8 to 22 years, receiving optometric visual training at Gesell Institute.
Methods: 30 one-hour sessions of training once a week; behavioral tests (Posture, Rorschach, Wechsler, Bender-Gestalt) administered by a psychologist working independently, to be evaluated independently by two psychologists.
Duration: June 1964-December 1967.
Investigator(s): John W. Streff, O.D., Director of Visual Research, Gesell Institute of Child Development, New Haven 11, Conn.
Cooperating group(s): Gesell Irstitute of Child Development Visual Research Fund.

18-T-28 AUTONOMIC LABILITY, VISUAL GENERALIZATION, CONDITIONING, AND MOTOR PERFORMANCE IN ABNORMAL CHILDREN AND CHILDREN WITH MINIMAL BRAIN DYSFUNCTIONS

Purpose: To develop a battery of tests that will enable a reliable assessment of brain dysfunctions.
Subjects: Thus far, 60 normal children and 30 children with minimal brain dysfunctions, 6 to 12 years of age. Latter group are hyperactive, have difficulty in talking or reading, or exhibit motor incoordination and single perceptual defects.
Methods: Standard psychophysiological, conditioning, and psychophysical methods; Weschler Intelligence Scale for Children.
Findings: Autonomic lability is correlated with motor impulsivity, fast reaction times in motor tasks, and response discrimination in conditioning. Minimal-brain-syndrome (MBD) children exhibit, in general, more autonomic lability and associated signs than normal children.
Duration: June 1963-1967.
Investigator(s): Roscoe A. Dykman, Ph.D., and John E. Peters, M.D., Professors, Department of Psychiatry, and Jim Boydston, Medical Student, Medical Center, University of Arkansas, Little Rock, Ark.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Two or three papers to be written in next two years.

18-T-29 THE APPLICABILITY OF WISC RATIOS IN THE DETECTION OF CEREBRAL DYSFUNCTION IN CHILDREN

Purpose: To study the usefulness of Hewson-type ratios as applied to WISC profiles of brain-damaged and nonbrain-damaged children.
Subjects: 20 groups of children covering various categories (private, public, clinic, hospital, sex, ethnic groups, etc.), half of whom have various types and degrees of cerebral dysfunctions; other half are matched controls.
Methods: WISC profiles were scored for six ratios derived from Hewson's work on the WAIS. Means, standard deviations, and correlation coefficients were derived together with age, full I.Q., verbal I.Q., and performance I.Q.
Findings: Encouraging for at least three of the six ratios, but sex differences seem to obliterate somewhat the usefulness of these ratios in the detection of cerebral dysfunctions.

Duration: January-December 1964.
Investigator(s): Luciano L'Abate, Ph.D., Assistant Professor and Chief Psychologist, Children's Unit, School of Medicine, Emory University, Atlanta, Ga.
Cooperating group(s): Aileen Clawson, Ph.D., Clinical Psychologist, Wichita Child Guidance Center, Wichita, Kans.

18-T-30 RELATIONSHIPS BETWEEN WECHSLER INTELLIGENCE SCALE FOR CHILDREN SCORE PATTERNS AND BRAIN DAMAGE IN CHILDREN

Purpose: To investigate possible relationships between score patterns and focus of damage.
Subjects: Approximately 60 children referred to pediatric neurology clinic because of possible central nervous system dysfunction.
Methods: Wechsler Intelligence Scale for Children; neurological evaluation.
Duration: March-November 1964.
Investigator(s): Gerald Gruden, Ph.D., Assistant Professor of Psychology, Pediatric Neurology Clinic, Department of Neurology, Medical Center, Indiana University, Indianapolis, Ind.

18-T-31 DEVELOPMENT OF NEUROMUSCULAR COORDINATION BY CHILDREN WITH BRAIN DAMAGE

Purpose: To study the relationships between impairment of motor skills and intellectual functions in children with neurological evidence of cerebral dysfunction.
Subjects: 44 children under age 7 and 12 children over age 7 having organic cerebral dysfunction of known and unknown etiology, including children referred mainly for speech problems, as well as a few with behavior and motor disorders.
Methods: Physical and neurological-psychological examinations were carried out to elicit information concerning visual-motor activity and, qualitatively, the relative ability to receive and communicate information by means of the sensory modalities of audio-verbal, visual-motor, and, to some extent, tactile-kinesthetic-motor modalities. The Wechsler Intelligence Scale for Children and other similar tests were used in psychological examinations. Motor development testing was carried out by use of Lincoln-Oseretsky Motor Development Test in children over age seven or the Gesell in children under age seven. Encephalography has been used in most cases; speech examination and, when indicated, a hearing examination has been performed.
Findings: Number of subjects examined is insufficient to subject to profound statistical study. However, a number of apparent trends will help in defining future studies. A large number of children who have both language and articulation disturbances also have associated motor, adaptive, or personal-social developmental delays. An extremely large percent also have positive electroencephalographic findings.
Duration: 1964-not reported.
Investigator(s): Daniel Halpern, M.D., Auke Tellegen, Ph.D., Clinical Psychologist, and Marjorie Thorpe, B.S., Occupational Therapist, Department of Physical Medicine and Rehabilitation, Medical Center, University of Minnesota, Minneapolis, Minn. (Reported by Frederic J. Kottke, M.D., Ph.D., Professor and Head, Department of Physical Medicine and Rehabilitation.)

18-T-32 STUDIES ON THE POSTURAL ATTITUDES OF CHILDREN WITH DAMAGED CENTRAL NERVOUS SYSTEM

Purpose: To study: (1) influence of sensory function in the development of a balanced posture; (2) relationship of time and reproducibility of response on

the development of postural reflexes; (3) relative influence of antagonistic reflexes on the postural attitude; and (4) effect on posture of abtunding or abolishing various sensory stimuli.
Methods: The influence of different sensory modalities in determination of verticality will be evaluated. Modalities chosen are those generally considered to have influence on postural adjustment--muscle receptors in the neck, proprioceptors of the cervical and lower vertebral joints, static vestibular sensation, and tactile and pressure sensation. A systematic study in normals is planned in which individuals will be subjected to lateral body tilt, with and without muscle activity, head tilting alone, body tilting alone, and application of weights to exert traction laterally to head to maintain active muscle contraction in muscles on one side of neck. Effect of each of these procedures on individuals' ability to determine verticality of an external object, such as a luminous rod, or of the body of the individual when tilted, will be used as criterion. By factorial analysis, influence of each modality may be inferred.
Duration: 1964-not reported.
Investigator(s): Daniel Halpern, M.D., Richard Owen, M.D., Psychiatrist, and Auke Tellegen, Ph.D., Psychologist, Department of Physical Medicine and Rehabilitation, Medical Center, University of Minnesota, Minneapolis, Minn.
(Reported by Frederic J. Kottke, M.D., Ph.D., Professor and Head, Department of Physical Medicine and Rehabilitation, Medical Center, University of Minnesota.)

18-T-33 NEONATAL SEIZURE STATES

Purpose: To investigate etiology, diagnosis, and prognosis of neonatal seizure states.
Subjects: Newborns having seizures in first two weeks of life.
Methods: Clinical evaluation and follow-up for four years; EEG, serial studies.
Findings: Initial study reveals difficult prognostic value of most clinical methods for neurological study of newborn, while significantly helpful data were obtained from serial EEG.
Duration: 1960-1966.
Investigator(s): Cesare T. Lombroso, M.D., Ph.D., Director, Seizure Unit and Laboratories, Department of Neurology, Children's Hospital Medical Center, Boston, Mass.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Ten papers in press.

18-T-34 ATTITUDES OF TEACHERS TOWARD CHILDREN WITH SEIZURES

Purpose: To ascertain teacher information concerning epilepsy and teacher attitudes toward children with epilepsy.
Subjects: 700 elementary and secondary teachers in public schools of Minneapolis.
Methods: Questionnaire to which teachers respond: 5 identifying facts about teachers; 12 questions concerning information and attitudes.
Duration: December 1963-September 1964.
Investigator(s): Dewey G. Force, Jr., Ph.D., Associate Professor of Special Education, University of Minnesota, Minneapolis, Minn.
Cooperating group(s): Minnesota Epilepsy League.
Publication: Report to be submitted to Minneapolis Public Schools and Minnesota Epilepsy League.

18-T-35 FAMILIAL CONSEQUENCES OF CHILDREN WITH CEREBRAL DEFECTS

Purpose: To find ways of studying the impact of brain-damaged children upon their families, with particular reference to low income and ethnic minority groups.
Subjects: (1) Low income and minority group families with cerebrally damaged children; (2) families at high risk of having a cerebrally damaged child or families in which such children already live but where identification has not been made by or to the family; and (3) comparison families in low income and minority groups with normal children.
Methods: A social research unit will adapt field interview methods to study family structure and behavior, as related to identification of brain damage in a child. Families are selected from: (1) rosters of those seeking service in a health center for reasons other than brain damage; (2) among families in the long-term collaborative roster of children with identifiable neurological defect; and (3) ultimately among families entering the collaborative project who are considered to be at high risk. Emphasis is placed upon structured interview methods applied in field.
Duration: September 1963-September 1965.
Investigator(s): Howard Kelman, Ph.D., Assistant Professor of Preventive Medicine, and Jonas N. Muller, M.D., Chairman and Professor of Preventive Medicine, New York Medical College, New York 29, N. Y.
Cooperating group(s): Association for the Aid of Crippled Children.

18-T-36 OPERANT CONDITIONING WITH BRAIN-DAMAGED CHILDREN

Purpose: To determine the efficacy and extent to which operant conditioning approaches may be used to establish auditory discrimination and receptivity for aural language with aphasic children.
Subjects: Nonverbal children, 5 to 10 years of age, diagnosed as having central nervous system dysfunctions.
Methods: Operant conditioning; reinforcement for correct nonverbal responses.
Findings: Encouraging for establishing sound discrimination.
Duration: January-September 1964.
Investigator(s): Leija McReynolds, Ph.D. Candidate, and Jon Eisenson, Ph.D., Director, Institute for Childhood Aphasia, School of Medicine, Stanford University, Palo Alto, Calif.
Publication: To be submitted to appropriate journals at completion of study.

18-T-37 INVESTIGATION OF CORRELATION BETWEEN AUDIOMETRIC RESPONSES AND TEMPERATURE, BAROMETRIC PRESSURE, AND RELATIVE HUMIDITY IN CHILDREN WITH CEREBRAL PALSY

Purpose: To discover by mensuration whether there is variable hearing in children with cerebral palsy.
Subjects: Children of all ages with cerebral palsy.
Duration: March 1964-March 1965.
Investigator(s): Mary Ann Classon, M.A., Speech Therapist, D. C. Society for Crippled Children, 2800 Thirteenth St., N. W., Washington, D. C. (Reported by William P. Argy, M.D., Medical Director, D. C. Society for Crippled Children.)
Cooperating group(s): U. S. Weather Bureau.
Publication: To be published.

18-T-38 ABSTRACTION AND SOUND DISCRIMINATION ABILITIES IN CEREBRAL PALSIED AND MENTALLY RETARDED CHILDREN

Purpose: To investigate comparatively the abilities of these children in these two areas.

Subjects: 153 cerebral palsied children and 115 mentally retarded children, 6 to 17 years of age.
Methods: Administration of Irwin-Jensen Sound Discrimination Test and the Irwin-Hammill Abstraction Test to subjects.
Duration: 1963-1966.
Investigator(s): Don D. Hammill, Ph.D., Assistant Professor, and Orvis C. Irwin, Ph.D., Adjunct Professor, Institute of Logopedics, 2400 Jardine Dr., Wichita, Kans.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be published in the Cerebral Palsy Review.

18-T-39 A FOLLOW-UP STUDY OF CHILDREN WITH CEREBRAL PALSY

Purpose: To assess change and correlates of change in a population of severely disabled children with cerebral palsy who were discharged to the community following long-term inpatient rehabilitation treatment.
Subjects: A study sample will be drawn from children who were hospitalized on special children's unit at Bird S. Coler Hospital between 1956 and 1963.
Methods: Present health, social, and physical status of those children discharged to community will be assessed through field interview and examination by a nurse and a social worker. Families will also be studied. Present status will be compared with status at time of admission and discharge from hospital. Information will also be gathered from health and health related agencies with whom child or family has had contact since discharge.
Duration: March 1964-1966.
Investigator(s): Howard R. Kelman, Ph.D., Assistant Professor, Departments of Preventive Medicine and Physical Medicine and Rehabilitation, Jonas N. Muller, M.D., Professor and Chairman, Department of Preventive Medicine, and Milton Lowenthal, M.D., Professor and Chairman, Department of Physical Medicine and Rehabilitation, New York Medical College, 1 East 105th St., New York 29, N. Y.
Cooperating group(s): New York State Health Department.

18-T-40 FOLLOW-UP STUDY OF CHILDREN FORMERLY ENROLLED IN THE SCHOOL FOR CEREBRAL PALSIED CHILDREN, SOUTHERN CALIFORNIA

Purpose: To correlate medical, psychological, sociological, and educational findings.
Subjects: 450 children, 3 to 17 years of age, with impairment of the central nervous system, who are residents of the 10 counties in Southern California.
Methods: Data will be interpreted after reducing them to a series of smaller projects or topics with questions suitable for data processing cards.
Duration: July 1964-June 1966.
Investigator(s): Melba M. Miller, Ed.D., Superintendent, School for Cerebral Palsied Children, 4339 E. State College Dr., Los Angeles, Calif. 90032.
Publication: To be submitted to medical, psychological and/or educational journals as appropriate.

18-T-41 BEHAVIOR AND CHRONIC DISEASE: A STUDY OF CHILDREN WITH DIABETES

Purpose: To compare the behavior of a group of children having a chronic disease (diabetes) with a normal group; to study the relationship between behavior and disease symptomatology.
Subjects: 16 male and 11 female diabetics between 8 and 12 years of age; a normal control group matched for I.Q., age, and sex.
Methods: Use of a newly developed technique standardized on normal children

and allowing objective scoring of children's responses to neutral stimuli (Emotional Perception Scale); categorization of disease symptomatology by laboratory findings and medical information.
Findings: Children with diabetes differ in behavior from normal children. Mean score for measure of behavior fell in behavior disorder range established in other research. Those children whose disease symptoms were more difficult to control showed more evidence of behavior disorder.
Duration: October 1963-July 1964.
Investigator(s): Theron Alexander, Ph.D., Associate Professor of Psychology in Pediatrics, and Charles H. Read, M.D., Professor of Pediatrics, State University of Iowa, Iowa City, Iowa.
Publication: To be published in a professional journal.

18-T-42 CONGENITAL HEART DISEASE: ITS MEANING TO THE AFFECTED CHILD AND HIS FAMILY

Purpose: (1) To determine the effect of a child's congenital heart disease on family life and on child's adjustment; (2) to investigate some of the factors that might influence the degree of effect of congenital heart illness; and (3) to compare characteristics of a group of children with congenital heart disease with a matched group of normal children.
Subjects: 20 experimental children, 4 to 14 years old (and their families), were admitted over a 5-month period to University of Florida Medical Center for cardiac catheterization. Normal control children were matched with experimental children for age, sex, race, I.Q. and socio-economic position.
Methods: Information dealing with effect of congenital heart illness on family was elicited through parent-focused interviews. MMPI tests were given to each parent. Experimental and control children were given an intelligence test followed by a focused interview involving H-T-P, Draw Inside of Body Test, and sentence completion tests. Also, a cardiologist classified severity of each child's illness using function classification employed by American Heart Association.
Findings: Thus far: (1) actual severity of child's illness was not related to degree of overprotectiveness nor to degree of effect of illness on family life; (2) mothers who distorted severity of their child's heart disease tended to overprotect their children more than mothers who perceived their child's illness accurately; (3) illness had a significantly greater effect on family life when mothers distorted severity of child's illness; and (4) the longer the family had lived with knowledge of child's illness, the greater the effect of disease on family life.
Duration: April 1963-June 1965.
Investigator(s): David R. Offord, M.D., Instructor in Psychiatry, and Joseph F. Aponte, B.S., Research Assistant, Department of Psychiatry, University of Florida, Gainesville, Fla.
Cooperating group(s): Florida State Board of Health.

18-T-43 ADAPTATIONAL AND DEFENSIVE BEHAVIOR IN YOUNG HEMOPHILIACS AND THEIR PARENTS

Purpose: To determine whether psychological factors influence the course of hemophilia; to study coping strategies, defensive behavior, and ensuing success or failure of adaptation of both child and parent.
Subjects: 32 hemophilic boys and their parents. Majority of children are between ages of 6 and 18. Of the 22 families, 9 have more than one hemophilic child. High clinical severity and diagnosis before age one characterize most of patients.
Methods: Subjects followed for up to two years by psychiatric interviewing and observations during children's numerous admissions. Hospital records and conferences with pediatricians have been used to amplify information about children's past history.

Findings: (1) A majority of patients and parents show good to optimum adaptation to hemophilia and its complications; (2) eight hemophiliacs show failure of adaptation due to deviation from optimum range of defensive behavior; (3) characteristic sequence of defensive techniques is used by most patients and parents as part of coping process; and (4) psychophysiological mechanism of bleeding, superimposed on the organic defect is evidenced.
Duration: January 1963-continuing.
Investigator(s): Ake Mattsson, M.D., Instructor in Child Psychiatry, Western Reserve University, 2040 Abington Rd., Cleveland 6, Ohio. (Reported by Willard D. Boaz, M.D., Director, Department of Child Psychiatry, Western Reserve University.)
Publication: To be submitted for publication to a pediatric and a psychiatric journal in 1965.

18-T-44 CLINICAL EVALUATION OF EXPERIMENTAL ORTHOTIC DEVICES AND PROCEDURES

Purpose: (1) To determine validity of principles of prescription for new devices; (2) to document in detailed manner indications and contraindications for new devices; (3) to test new materials for use in orthotic devices; (4) to develop new methods for alignment and fitting; and (5) to evaluate effectiveness of experimental devices.
Subjects: Present caseload of 25 children, ages 2 to 14, having variety of orthopedic and neuromusculoskeletal disorders.
Methods: Subjects are being examined to establish adequate criteria for design of devices. There is a cooperative effort with physicians, engineers, and orthotists to attempt to design devices to resolve problems.
Duration: November 1961-October 1964.
Investigator(s): Verne T. Inman, M.D., Ph.D., Professor of Orthopedic Surgery and Director, Biomechanics Laboratory, San Francisco Medical Center, University of California, San Francisco, Calif.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

18-T-45 CHILD AMPUTEE PROSTHETICS PROJECT

Purpose: (1) To explore the feasibility of prosthetics for children with one or more missing limbs and to establish optimum ages for initial fitting; (2) to establish the extent and type of training techniques necessary; (3) to devise suitable components for all types of limb prostheses; (4) to explore the psychological involvement of limb-deficient children and their parents, and to devise methods of preventing or alleviating these conditions; and (5) to collect data on prenatal and family histories for etiological studies.
Subjects: Clinical caseload of over 230 limb-deficient children.
Methods: Study of children; research and development of new devices and experimental fitting on children. Each member of the professional research staff is conducting independent research either alone or collectively with other staff members.
Findings: Scaled-down adult components used on children have fallen far short of satisfying children's many needs. Definite skills and techniques are necessary in fabrication and in fitting of growing children. Even with the most accurately devised and fitted prosthesis, failure will result without accurate and sustained occupational and physical therapy. The family requires prompt, adequate, and sustained care during this critical period as the shock of the birth of a limb-deficient child or an acquired amputation is much deeper than has been previously recognized. The medical health of these children is comparable with the child of the average population. Surgical requirements are infrequent, but extremely important. Consultation with a surgeon in this field is necessary before any surgical procedures for anticipated prosthetic use.

Duration: 1955-indefinite.
Investigator(s): Milo B. Brooks, M.D., Medical Director, and staff, Child Amputee Prosthetics Project, University of California, Los Angeles, Calif.
Cooperating group(s): California Crippled Children Services; National Academy of Sciences; National Research Council; Subcommittee on Children's Prosthetics Studies, Research Division, New York University.
Publication: Annual reports, 1956 through 1963; *The Limb-Deficient Child*, University of California Press; Inter-Clinic Information Bulletin.

THE CHILD IN THE FAMILY

Family background and relations

18-U-1 A LONGITUDINAL STUDY OF FERTILITY IN DETROIT AREA WITH SPECIAL REFERENCE TO ECONOMIC STATUS, UNEMPLOYMENT, AND FAMILY GROWTH

Purpose: To investigate the social and economic factors associated with various patterns of fertility, family growth, and expectations for future births; to investigate the reliability of expectations about family size as a basis for predicting aggregate and individual fertility; and to assess the factors affecting stability of such expectations.
Subjects: Initially based on probability sample of about 1,300 women who had a first, third, or fourth birth in July 1961 or were married that month in Detroit Metropolitan area.
Methods: Initial interviews were held and all women were reinterviewed twice at intervals of a year to check on changes in fertility, expectations, employment and economic position, etc.
Findings: After three interviews, there is remarkable stability in aggregate expectations about family size, resulting from stable expectations in about half the sample and many small compensating changes in the rest. Unexpected pregnancies are an important cause of upward changes in expectations. Unless a couple has a pregnancy in a rather short period following the interview, they are likely to change expectations downward. Catholics have much larger family size expectations than non-Catholics; however, Catholics' ideas are more changeable. The changes compensate and do not change relative position of Catholics and non-Catholics. Catholics least closely attached to the Church change most, presumably because they are under most cross-pressures between Church and general community. Those who were unemployed are even more likely to change, although changes are not necessarily downward. Illnesses, even if ranked as having major costs attached, were not associated with changes.
Investigator(s): Ronald Freedman, Ph.D., Professor of Sociology, and Director, and Lolagene C. Coombs, M.A., Research Associate, Population Studies Center, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Ford Foundation; Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Public Opinion Quarterly 28:112-117, 1964; other publications will be forthcoming in the next 18 months.

18-U-2 SOCIAL FACTORS AFFECTING FERTILITY AND FAMILY PLANNING IN TAIWAN

Purpose: To investigate the social, economic, and demographic factors affecting level and variations in fertility and family planning in Taiwan prior to an organized family planning program; to investigate what situations and types of people are involved in accepting family planning as part of a planned experimental program.
Subjects: Main group consists of 36,000 women, 20 to 39 years old, in Taichung, the fourth largest city. In addition, an intensive longitudinal study was done for a probability sample of 2,400 of these.
Methods: Accumulation of data involves: (1) registration data on population, births for entire city and its 2,400 neighborhood units; (2) intensive sample survey of 2,400 women; (3) short questionnaire interviews with random sample of 12,000 of these women visited at home; and (4) clinic records on 6,000 women who came to clinic for help with family planning.

Findings: In pre-program period there is great consensus on a moderate number of children, desire to learn about family planning that is general, and practice of several forms of family limitation by a significant minority; however, practice is so ineffective that even the most educated have more children than wanted by age 35 to 39. In an experiment to bring family planning to the people on a massive basis many more than 6,000 accepted; information about program was greatly aided by word-of-mouth diffusion. The great majority of requests were for intra-uterine devices. While lower socio-economic groups had done little to adopt family planning before, they were an important part of the accepting group afterwards.
Duration: June 1962-June 1966.
Investigator(s): Ronald Freedman, Ph.D., Professor of Sociology, and Director, Population Studies Center, and John Y. Takeshita, Ph.D., Assistant Professor of Sociology, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Population Council; Ford Foundation; Provincial Health Department of Taiwan.
Publication: Scientific American, May 1964; Population Studies, March 1963; a book will be prepared in the next two years.

18-U-3 PARENTS IN THE PERINATAL PERIOD

Purpose: To evaluate the nature, extent, background and origin of the problems faced by both parents in the perinatal period.
Subjects: (1) Primiparous parents attending a relatively expensive obstetric clinic; and (2) primiparous parents attending a clinic for patients on welfare or with a low income.
Methods: Tape recorded structured interviews with wives prepartum in the clinic and postpartum in their homes. A written questionnaire is filled out during their hospital stay. The husbands answer written questionnaires both prepartum and postpartum.
Duration: July 1960-June 1966.
Investigator(s): Norman F. Miller, M.D., Professor Emeritus, Department of Obstetrics and Gynecology, and John R. Gosling, M.D., Associate Professor, Department of Obstetrics and Gynecology, School of Medicine, University of Michigan, Ann Arbor, Mich. (Reported by Lois K. Rupke, R.N., Department of Obstetrics and Gynecology.)
Cooperating group(s): Maternal and Child Health Section, Michigan State Health Department.
Publication: Report made to the Maternal and Child Health Section of the American Public Health Association at the annual meeting, October 1962.

18-U-4 PSYCHOLOGICAL STRESS IN PREGNANCY

Purpose: To explore attitudes during pregnancy and their relation to physical complications during pregnancy, labor, and delivery and to the physical status of the neonate.
Subjects: 156 pregnant women at Children's Hospital.
Methods: A pregnancy attitude questionnaire was administered to all subjects; 54 were retested with same questionnaire four to six weeks after delivery. Prenatal, delivery, and neonatal data were analyzed in relation to attitudes.
Findings: Anxiety and rejection of the pregnancy were associated with more health problems in pregnancy, but not significantly with greater physical complications of the total pregnancy experience, including labor and delivery. Sexual attitudes were highly associated with the pregnancy experience.
Duration: 1960-1964.
Investigator(s): Martin I. Heinstein, Ph.D., Research Psychologist, Bureau of Maternal and Child Health, California State Department of Public Health, Berkeley 4, Calif.

Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted for journal publication in late 1964 or early 1965.

18-U-5 FAMILY STRUCTURE AND INTERPERSONAL RELATIONS

Purpose: To discover any existing linkage between authority structure in families (patriarchal, matriarchal, or equalitarian) and quality of relationships between husband and wife, child and parents, and child and his peers.
Subjects: (1) 850 students in grade 8, most from schools in northern Indiana, some from localities in Pennsylvania and Kansas; (2) 605 students in grade 8 from schools in Frankfurt, Germany.
Methods: Self-reporting questionnaires (translated for German subjects) administered in classroom situation arranged during school hours.
Findings: Equalitarian families are somewhat favored over patriarchal and matriarchal types in regard to scores on interpersonal relationships scales. Scores are lowest for matriarchal families. Differences in scale scores between rural and urban families were found to be insignificant.
Duration: January 1963-summer 1965.
Investigator(s): J. Howard Kauffman, Ph.D., Professor of Sociology, Goshen College, Goshen, Ind.
Cooperating group(s): National Science Foundation.
Publication: Articles in preparation.

18-U-6 FAMILY AND SCHOOL SOCIALIZATION

Purpose: To examine three potentially salient socialization variables, postulated in earlier work by Larson and Myerhoff. Specifically, to determine the extent to which these variables, separately and in combination, are associated with the acceptance of culturally provided goals--in this case, goals surrounding success in school.
Subjects: Adolescent boys, their fathers and mothers; in all, 148 families are involved.
Methods: Four-hour interviews held with each family member (father, mother, and son) separately, but at the same time. Primary emphasis was on study of different types of correspondence in child-training practices. The three variables postulated cover a three-generation time span and three contemporary role positions and are titled "consistancy," "continuity," and "congruence." They are operationalized by means of interview data bearing upon practices used upon the parents of the subject boy, as well as those used upon the subject at present.
Duration: March-November 1964.
Investigator(s): William R. Larson, M.A., Project Head, Youth Studies Center, University of Southern California, Los Angeles 7, Calif.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: To be published in professional journals upon completion.

18-U-7 MOTIVATIONAL AND INCENTIVE FACTORS IN SOCIALLY INFLUENCED BEHAVIOR

Purpose: To study parent-child interaction and parental attitudes as antecedents of individual differences in susceptibility to social influence and pressures to conform.
Subjects: High school and college students.
Methods: Experimental assessment of conforming behavior; retrospective report

of perceived parental attitudes and parent-child interactions.
Duration: January 1962-December 1965.
Investigator(s): John W. McDavid, Ph.D., Associate Professor of Psychology, University of Miami, Coral Gables, Fla.
Cooperating group(s): Office of Naval Research, Department of the Navy, U. S. Department of Defense.
Publication: To be reported in Office of Naval Research technical reports and standard publication outlets.

18-U-8 PARENTAL ROLES IN THE SOCIALIZATION OF YOUNG ADULTS

Purpose: To examine nature of a postulated process of socialization which continues beyond adolescence and into early adulthood. Tentative model defines two aspects of such a process: (1) parental support toward extended education, new household formation, or career development as this serves to reinforce family's basic values; (2) relative competence of parents in giving advice to young adult offspring as this tends to guide specific implementation of family values. Research will test a set of hypotheses about these two aspects of continuing socialization as they may operate together in different types of families to maintain values from one generation to the next.
Methods: Design, building upon an earlier Rutgers study, will follow longitudinally two different samples in which offspring and their parents are studied at three different stages in family cycle.
Duration: 1962-1967.
Investigator(s): Matilda White Riley, Professor of Sociology, and staff, Rutgers, The State University, New Brunswick, N. J.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-U-9 PARENT-INFANT INTERACTION PATTERNS

Purpose: To identify primary mother-infant interaction patterns; to determine how these patterns are related to the early behavioral makeup of the infant, the preparental relationship of the mother and father, and the mother's early experience within her own family matrix. Sequencing of mother-infant interaction will be analyzed to determine probabilities of certain events leading to others. Analysis will be directed toward establishing the information yield of various events. In addition, sex differences and developmental changes in mother-infant behavior patterns will be studied for the first three months of life.
Subjects: 25 to 30 parent-infant combinations.
Methods: Direct observation in the home in order to make continuous recordings and ratings of selected maternal and infant behaviors. Two periods are studied during three-month intervals. Period one includes a cluster of three observations made at weekly intervals during first month of life to evaluate initial adaption process of mother and infant. Period two consists of another cluster of three observations made around three months when relatively stable patterns of behavior have been established. Each cluster includes one eight-hour and two three-hour observations. At seven weeks of age the infant with the mother and father spend an eight-hour laboratory session at the National Institutes of Health where tests are administered and interaction in various situations is evaluated.
Duration: January 1963-June 1964.
Investigator(s): Howard A. Moss, Ph.D., Psychologist, D. Wells Goodrich, M.D., Psychiatrist and Chief, Section on Family Development, Clinical Investigations, Child Research Branch, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.

18-U-10 STUDY OF NORMAL SEPARATION-INDIVIDUATION

Purpose: As an outcome of studies of symbiotic child psychosis (Bulletin 15, Research Relating to Children), to investigate the process of separation of the normal infant and toddler from his mother and, concomitantly, his developing individuation; to verify four subphases into which the normal separation-individuation phase can be divided, which grow out of the developing ego functions of the infant and are characterized by different developmental tasks and needs within mother-child unit.
Subjects: Normal mother-child pairs, with infants ranging from 2 to 3 months up to toddlers of 36 months; 6 to 8 mother-child pair subjects at any given period, recruited from available and interested neighborhood mothers.
Methods: Primarily an observational study of a limited longitudinal design (i.e., each mother-child pair followed intensively for approximately three years). Observations of a clinical and a more structured nature carried out by participant observers and by nonparticipant observers and raters (from a one way mirror booth), supplemented by interviews carried out by senior clinical workers, by home visits, and by formal testing.
Duration: September 1963-August 1968.
Investigator(s): Margaret S. Mahler, M.D., Director of Research, Masters Children's Center, 75 Horatio St., and Clinical Professor of Psychiatry, Albert Einstein College of Medicine, Yeshiva University, New York, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: The Psychoanalytic Study of the Child, Vol. 18, 1963; other publications planned.

18-U-11 PARENTS' SOCIAL LEARNING HISTORY AND FAMILY DYNAMICS

Purpose: To study effects of family constellation variables on dominance and conflict variables.
Subjects: College students.
Methods: Questionnaire.
Duration: April 1964-April 1965.
Investigator(s): James C. Baxter, Ph.D., Department of Psychology, University of Kentucky, Lexington, Ky.

18-U-12 KINSHIP SYSTEMS AND EMOTIONAL DISTURBANCE IN CHILDREN

Purpose: To determine whether various characteristics related to kinship in American society affect socialization of children adversely. Study is exploratory and is aimed at developing procedures for a more focused investigation.
Subjects: Several samples representing about 200 respondents have been used in the development of procedures. Core of study is comparison of: (1) families residing in Champaign-Urbana area, having a child under treatment for emotional disturbance, with (2) families of comparable ethnic and socio-economic background in which all children are considered by parents and friends as "normal".
Methods: Parents residing in Champaign-Urbana area have been interviewed in their homes and asked to complete questionnaires pertaining to kinship, family relationships, and description of child behavior.
Duration: July 1962-June 1965.
Investigator(s): Bernard Farber, Ph.D., Professor of Sociology, Institute for Research on Exceptional Children, University of Illinois, Urbana, Ill.
Cooperating group(s): Illinois Department of Mental Health.

18-U-13 PARENTAL AUTHORITARIANISM AND CHILDREN'S EMOTIONAL DISTURBANCE

Purpose: To investigate extent to which parents' authoritarian values are associated with severity of children's disturbance.
Subjects: Experimental group of child psychiatric patients; control group of matched normal children.
Methods: Careful matching of children and parents for pilot study; long-range survey of child psychiatry patients and their families for extensive study.
Findings: In pilot study, it was found that parental authoritarian values do differentiate normal and control groups.
Duration: 1961-1975.
Investigator(s): Paul L. Adams, M.D., Assistant Professor of Psychiatry and Pediatrics, J. Hillis Miller Health Center, University of Florida, Gainesville, Fla.
Cooperating group(s): Florida Council on Mental Health Training and Research.
Publication: Initial phase of pilot study to be published in American Journal of Psychiatry.

18-U-14 A COMPARATIVE STUDY OF CERTAIN MOTHER-CHILD RELATIONSHIPS WITH DISTURBED CHILDREN AND WITH THEIR SIBLINGS

Purpose: To explore differential relationships which individual mothers have with their children whom they consider well-adjusted and with their children whom they consider disturbed; to furnish suggestions which will be helpful in the therapeutic treatment of mother and child.
Subjects: 20 family units (mother, "disturbed" child, and normal child), selected from families whose children are undergoing diagnostic study at the Child Study Center of Philadelphia. All children are known to be brain-damaged, psychotic, mentally defective, or physically handicapped.
Methods: (1) Tests administered to mothers include Taylor Anxiety Scale, an attitude scale specifically devised to determine a numerical index into mother's psychological needs as they relate to each of her children, and the Thematic Apperception Test. (2) Tests administered to children consist of an attitude scale, similar to the one for mothers, to measure psychological needs in same areas, Children's Manifest Anxiety Scale, and the Thematic Apperception Test.
Duration: October 1963-February 1965.
Investigator(s): Beverly Todd (Ed.D. Candidate, Temple University), Staff Psychologist, Child Study Center of Philadelphia, 110 N. 48th St., Philadelphia, Pa.
Publication: Dissertation to be on file at Temple University.

18-U-15 ROLE PERCEPTIONS IN FAMILIES OF DISTURBED CHILDREN

Purpose: To elucidate patterns of role perceptions which characterize families of differing types of disturbed children; to determine how these patterns differ from those of normal families.
Subjects: Children who are patients in the Child Psychiatry Clinic, University of Washington Hospital, and their families.
Methods: Questionnaire and interview methods; questionnaire material contains both projective and direct questions as well as a picture method.
Duration: June 1964-January 1965.
Investigator(s): Leslie Y. Rabkin, Ph.D., Instructor in Psychiatry, Medical School, University of Washington, Seattle, Wash. 98105.
Publication: To be published in a psychological journal.

440

18-U-16 PARENTS' GROUP PSYCHOTHERAPY EXPERIENCE AS RELATED TO CHILDREN'S ADJUSTMENT

Purpose: To determine relationships between parent participation in group psychotherapy and follow-up study of children's adjustment.
Subjects: Both parents from 22 families who had sought psychological service for problems relating to their children's adjustment from the Michigan State University Psychological Clinic one to five years earlier.
Methods: Evaluation of parent's comments and ratings of changes in each child's adjustment following parental group psychotherapy.
Findings: At time of post-therapy follow-up, about 90 percent of parents described their children as better adjusted; improvement was especially noticeable in academic performance, and to a lesser degree, in family relationships.
Duration: 1963-1964.
Investigator(s): John R. Hurley, Ph.D., Associate Professor, and Robert L. Hohn, M.A., Department of Psychology, Michigan State University, East Lansing, Mich.
Publication: To be published in either American Journal of Orthopsychiatry or International Journal of Group Psychotherapy.

18-U-17 COMPARATIVE STUDY OF CHILDREN FROM "NORMAL" FAMILIES AND FROM FAMILIES IN WHICH A PARENT IS PSYCHOTIC

Purpose: To attempt to assess effect of family psychosis on the development of children.
Subjects: Children of normal parents (hospitalized and nonhospitalized); children of psychotic parents (hospitalized and nonhospitalized).
Methods: Phase I: screening by means of family questionnaire, symptom inventory, and Vineland. Phase II: intensive extended home visit, psychological testing, psychiatric interview, and developmental evaluation (for younger children).
Duration: January 1964-June 1965.
Investigator(s): Joan K. Barber, M.D., Director, Preventive Service, Division of Social and Community Psychiatry, Department of Psychiatry, Albert Einstein College of Medicine, Yeshiva University, Bronx, N. Y.

18-U-18 LEVEL OF PSYCHOSOCIAL ADJUSTMENT IN CHILDREN OF IDENTIFIED SCHIZOPHRENIC MOTHERS

Purpose: To investigate level of adjustment in children of mothers hospitalized for a schizophrenic disorder, and relationship between parent's level of pathology and child's current adjustment level.
Subjects: Children, 6 to 11 years old, attending public schools. Offspring of schizophrenic mothers (N=96) will be compared with children of psychoneurotic mothers (N=48), of chronically physically ill (N=48), and with children of mothers with normal adjustment patterns (N=48), with groups matched for age, sex, and parent's socio-economic status.
Methods: Parents will be interviewed with standard questionnaires on child's behavioral adjustment indices, and independent measures of adjustment of child will be obtained through the schools by means of teacher ratings, self inventories and sociometric techniques previously standardized in studies in California Public Schools. Parental pathology will be measured by psychological tests and ratings of hospital case material.
Duration: July 1964-June 1966.
Investigator(s): Arnold R. Beisser, M.D., Chief of Professional Education, and Norbert Glasser, Ph.D., Clinical Psychologist II, Metropolitan State Hospital, 11400 S. Norwalk Blvd., Norwalk, Calif.

Cooperating group(s): Research Division, California Department of Mental Hygiene.
Publication: Publication planned in psychological journals; progress reports in *California Mental Health Research Digest*.

18-U-19 MANAGEMENT AND EVALUATION OF A JOINT ADMISSION PROGRAM

Purpose: To test hypothesis that separation of the child from his psychotic mother increases her guilt, prevents development of positive feelings, and offers no opportunity for day-to-day experience with the child nor for direct therapeutic investigation of her relationship with the child. Also, to gather information on: (1) characteristics of women who have psychiatric disorders in the post-partum period; (2) introduction of joint admission to a large state hospital and methods of management found most useful; and (3) effectiveness of joint admission.
Subjects: 17 infants and young children cared for by their mothers in adult wards of the Massachusetts Mental Health Center during period mothers were in treatment for fairly severe emotional disturbances; mother-child pairs in which the disturbed mother was separated from her child during hospital treatment.
Methods: Patients studied carefully with full psychiatric work-up, psychological testing, and interviews with family members.
Duration: 1963-1966.
Investigator(s): Henry U. Grunebaum, M.D., Staff Psychiatrist, Justin L. Weiss, Ph.D., Chief, Clinical Psychology Service, and Louis Sander, M.D., Child Psychiatry Consultant, Massachusetts Mental Health Center, Cambridge, Mass.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-U-20 COUPLE-GROUP THERAPY

Purpose: A clinical study of the psychodynamics of parents of disturbed children.
Subjects: Couples manifesting marital and other problems who originally came to therapy with reference to a disturbed child.
Methods: Study of parents as couples, using couple-group therapy.
Duration: 1964-1965.
Investigator(s): Martin Megdal, M.D., Fellow in Child Psychiatry, and Irvin A. Kraft, M.D., Chief, Division of Child Psychiatry, Houston State Psychiatric Institute, Houston, Tex.

18-U-21 IMPACT OF THE LAW UPON THE MENTAL, PHYSICAL, AND MORAL HEALTH OF THE FAMILY UNIT

Purpose: The initial phase is a comprehensive socio-legal study of childhood mental retardation, covering every significant area from detection of the child's retardation through the various phases of his education, treatment and training as a basis for a brief in support of the thesis that the institutionalized mentally retarded child has a legal right to therapy and treatment in accordance with sound prevailing medical norms. A Model Code on Mental Retardation will be drafted along with a brief in support of its adoption by the states. The second phase will enlarge upon the first by a study of legal problems of children generally in context of the family unit. This phase will include a study of the family as a legal unit with emphasis on problems of child custody, child support, paternity, guardianship, adoption and annulments, and the need for establishment of family courts to function in these problem areas.

Duration: 1964-indefinite.
Investigator(s): David W. Louisell, LL.B., Professor of Law, Arthur H. Sherry, LL.B., and Bernard L. Diamond, M.D., Professors of Law and Criminology, and Staff, University of California, Berkeley 4, Calif.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-U-22 A STUDY OF BATTERED CHILD LEGISLATION

Purpose: To identify and formulate the issues arising from the drafting of child abuse statutes through a study of the legislative settings in which such laws were enacted; to determine what reporting has, in fact, occurred and what other consequences have taken place in cases arising after the enactment of child abuse legislation.
Duration: 1964-indefinite.
Investigator(s): Monrad G. Paulsen, J.D., Professor of Law, and Graham E. Parker, J.D., Research Associate, School of Law, Columbia University, New York, N. Y. 10027.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-U-23 PARENTS OF BATTERED CHILDREN

Purpose: To gain understanding of the problem of why parents attack children. To get a clearer picture of dynamics of such behavior and to explore possibilities of treatment and prevention.
Methods: Parents of battered children will be studied in as much depth and for as long a time as possible. Psychiatric interviews and psychological testing will be employed whenever possible. Home visits will be made by social workers and joint interviews with parents, psychiatrist, and social worker will be held.
Duration: 1962-indefinite.
Investigator(s): C. Henry Kempe, M.D., Professor and Head, Department of Pediatrics, and Brandt F. Steele, M.D., Associate Professor, Department of Psychiatry, University of Colorado School of Medicine, Denver 20, Colo.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-U-24 A STUDY OF BATTERED CHILDREN IN DENVER

Purpose: To acquire general information concerning battered children and their families: types of injuries, family characteristics, attitudes, and behavior patterns; to study effects of injury on children's behavior; to study actions taken by Denver Welfare Department, police, and courts; and to analyze implications for the city.
Subjects: Caseload of all battered children in Denver for one year.
Methods: Statistical analysis of actions taken on behalf of battered children, family patterns and attitudes, battered children's behavior.
Duration: June 1964-June 1965.
Investigator(s): Betty Johnson, M.S.W., Supervisor, Child Welfare Services, and Harold Morse, B.A., Supervisor, Research and Statistics, Denver Department of Welfare, Denver 4, Colo.

18-U-25 A FOLLOW-UP STUDY OF NEGLECTFUL PARENTS

Purpose: To learn how parents of 33 families who were once considered neglectful by a protective agency were caring for their children two years after their cases were closed as "service completed".
Methods: Families were interviewed in their homes with prepared schedule. Minimum standards of care were also developed as a base for questions used in the schedule and for use in future research.
Findings: A majority of families were not giving their children proper care and needed community services that were more integrated, comprehensive, and sustained. The greater proportion needed help with problems of loneliness, relationships, and their lack of skills in home management.
Duration: Not reported-1963.
Investigator(s): Gordon Kingsford Askwith (Doctoral Candidate, University of Pennsylvania School of Social Work), 1869 Crystal Crescent, London, Ont.
Cooperating group(s): Pennsylvania Society for the Protection of Children from Cruelty.

18-U-26 PROBATION SERVICES FOR ADULTS FOUND GUILTY OF CHILD NEGLECT

Purpose: Primary goal is child protection, through the modification of attitudes and behavior patterns of the adult offender, to the degree that his or her children are no longer placed in jeopardy. It is recognized that the complete reformation of adult offenders in this area is unlikely; and realistically, probation officers of the juvenile court have neither the skills nor the facilities to deal effectively with the total range of problems presented by such offenders and their families. However, this program reasonably expects to: (1) better equip the probationer to cope with the pressures and responsibilities of parenthood; and (2) motivate the probationer and his or her family toward improved status by revealing opportunities for self-improvement where the subject sees no such opportunities.
Subjects: Neglectful parents involved in cases in which removal of the children from the home and/or incarceration of one or both parents is not necessary and the family remains intact following the court's finding of neglect.
Methods: Individualized casework, group counseling. Initial evaluation is to be made in June 1964.
Duration: June 1963-continuing.
Investigator(s): Frederic L. Faust, ACSW, Director of Court Services, and staff, Franklin County Court of Domestic Relations, 50 East Mound St., Columbus, Ohio 43215. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1963-1964.)

18-U-27 A COMPARATIVE STUDY OF SOME ASPECTS OF FAMILY FUNCTION IN CHILDREN WITH ACTUAL AND PREDICTED READING DISABILITY AND CHILDREN WITH READING COMPETENCE

Purpose: To determine incidence of family pathology in located groups of children with reading disability. Specifically, to test hypothesis that there will be a greater degree of psychopathology in families: (1) with children having established reading disability; or (2) with children having a school prognosis for reading disability than will be found in control families in which the children either have no reading disability or are predicted not to acquire it.
Subjects: 48 boys and 12 girls from a large public elementary school in New York city, divided into 4 groups of 15 children each: (1) Reading Disability Group (3rd and 4th graders designated by school as having a reading disability of at least 18 months); (2) Reading Disability Control Group (children of same age and grade who were competent readers); (3) Predicted Reading Disability

Group (second graders who had during the previous school year scored below the 50th percentile on a routine reading readiness test); and (4) Predicted Reading Disability Control Group (selected in parallel fashion to group 2).
Methods: Family questionnaire administered separately to mothers and fathers of all four groups. Four critical areas of family functioning were sampled with four scales on questionnaire: (1) Husband-Wife Attitudinal Difference Scale; (2) Symptom Scale (feeding problems, toilet problems, general family problems); (3) Maternal Role Adequacy Scale; and (4) Father's Work Role Adequacy Scale.
Findings: Presented at Annual Meeting of American Orthopsychiatric Association, Chicago, March 1964.
Investigator(s): Israel Zwerling, M.D., Ph.D., Director, Division of Social and Community Psychiatry, and Marilyn Mendelsohn, M.S.W., Instructor in Psychiatry, Albert Einstein College of Medicine, Yeshiva University, New York, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-U-28 PARENTS AS IDENTIFICATION MODELS AND REINFORCERS OF CHILDREN'S ACHIEVEMENT BEHAVIOR

Purpose: To elucidate and evaluate the influences of parents and elder siblings on children's achievement development; to study attitudinal and motivational characteristics of children predictive of their achievement behaviors; to systematically vary attributes of achievement situations to determine effects of these treatments on children's achievement performance; to study interactive effects of personality and situational variables on those behaviors.
Subjects: Children, ranging in age from birth to college age, from Fels longitudinal sample, surrounding community (and parents), selected schools in Greene County School System, and Antioch College.
Methods: Interviews, specially constructed questionnaires, behavioral observations in situ and in experimental sessions, rating scales, records from Fels longitudinal files and school files, etc.
Duration: 1959-indefinite.
Investigator(s): Virginia C. Crandall, M.A., Research Associate, Fels Research Institute, Antioch College, Yellow Springs, Ohio.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Numerous articles in Child Development, Journal of Consulting Psychology, Journal of Genetic Psychology, and others.

18-U-29 CHILD DEVELOPMENT AND ADOPTION STUDY

Purpose: To study differential interactions between different types of mothers and children.
Subjects: Children adopted in infancy.
Methods: Longitudinal study involving repeated interviewing of mother, and filming and psychological testing of child.
Duration: 1960-indefinite.
Investigator(s): Peter B. Neubauer, M.D., Director, Child Development Center, 120 W. 57th St., and Vera D. Bernard, M.D., Clinical Professor of Psychiatry, College of Physicians and Surgeons, Columbia University, New York, N. Y.

18-U-30 PRELIMINARY INVESTIGATION OF PARENTAL ATTITUDES TOWARD ADOPTED CHILDREN

Purpose: To assess and compare parental attitudes, personality structure, and

demographic variables among parents of adopted, emotionally disturbed, and normal children, seeking variables contributing to higher incidence of emotional disturbance in adopted children than expected from incidence of adopted children in general population.
Subjects: 50 parents each of: (1) adopted emotionally disturbed children; (2) adopted nondisturbed children; (3) nonadopted, nondisturbed children; and (4) nonadopted, disturbed children.
Methods: Administration of PARI (as modified by investigators), MMPI, and Shipley-Hartford.
Duration: 1962-1965.
Investigator(s): Paul V. Carlson, Ph.D., Assistant Professor of Medical Psychology, James Q. Simmons III, M.D., Senior Psychiatrist and Chief, Child Psychiatry (Inpatient Service), and Henry H. Work, M.D., Head, Division of Child Psychiatry, Neuropsychiatric Institute, University of California, Los Angeles 24, Calif.; Marshall Schechter, M.D., Medical Center, University of Oklahoma, Oklahoma City, Okla.

18-U-31 PARENTAL ATTITUDES TOWARD CHRONICALLY HANDICAPPED CHILDREN

Purpose: To study parental attitudes toward handicapped children; to ascertain whether attitudinal differences exist toward various chronic disease entities in children.
Subjects: Approximately 150 children representing problems in muscular dystrophy and cerebral dysfunction. Nonretarded, retarded, juvenile diabetic, and epileptic children will be investigated.
Methods: Parental Attitude Research Instrument.
Duration: February-December 1964.
Investigator(s): Eugene G. Roach, Ph.D., Chief Psychologist, Pediatric Neurology Clinic, Department of Neurology, Medical Center, Indiana University, Indianapolis, Ind.

18-U-32 EDUCATIONAL, VOCATIONAL, AND MARITAL ASPIRATIONS OF RURAL MOTHERS FOR THEIR ELEMENTARY SCHOOL CHILDREN

Purpose: To determine the aspirations rural parents hold for their elementary school children regarding education, vocation, and marriage; to determine relationships between these aspirations and certain social and economic variables.
Subjects: 338 rural mothers, each having a child in elementary school, randomly selected from school records of all elementary schools in two widely diverse counties.
Methods: Interview guide developed and pretested; tape-recorded interviews conducted with subjects in their own homes; interview data transcribed, coded, and electronically processed; Chi-square and other analyses performed.
Duration: June 1963-June 1965.
Investigator(s): Kate B. Garner, M.S., Research Instructor in Home Economics, University of North Carolina at Greensboro, Greensboro, N. C. 27412.
Cooperating group(s): Faculty Research Council, University of North Carolina at Greensboro; Agricultural Experiment Station, Raleigh, N. C.

18-U-33 THE TRANSMISSION AND MODIFICATION OF ATTITUDES AND BEHAVIOR PATTERNS OVER SUCCESSIVE GENERATIONS

Purpose: To arrive at a better understanding of how attitudes and interpersonal behaviors are transmitted and modified from one generation to the next.
Subjects: An American, urban, upper middle class kinship group of 25 members, including 2 sets of grandparents, 4 sets of parents, and 13 children.

Methods: Interviews conducted with each set of parents and grandparents. All four families observed interacting in two different situations, one consisting of four structured family tasks, and the other a dinner at which researcher was a guest. All material was tape recorded. Procedure for analyzing data will include: (1) categorization of content of interviews to reveal attitudes and value systems of parent and grandparent generations; and (2) use of a newly developed method for systematically observing family interactions. This method, which is being prepared for publication, provides profiles of each individual's primary motives when relating to other family members.
Duration: 1962-1965.
Investigator(s): Helene Borke, Ph.D., Research Associate, Western Psychiatric Institute and Clinic, Medical School, University of Pittsburgh, Pittsburgh 13, Pa.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication planned in spring 1965.

18-U-34 THE DEVELOPMENT AND ADJUSTMENT OF NEGRO AMERICAN CHILDREN

Purpose: To study over a two-year period the development and adjustment of Negro American children in relation to their family structure ("intact" versus "broken" homes) and social status ("upper" versus "lower" socio-economic classes).
Subjects: Approximately 343 Negro American children, ages 6 to 10, in primary school grades.
Methods: Comprehensive schedules have been developed for recording school grades and tests, teachers' evaluations, and physical examinations, and for interviewing the children, mothers and a 25 percent stratified sample of fathers or father substitutes. Additional instruments employed with child include Stanford-Binet (Form L-M), California Test of Personality, and a short general achievement test to compare with school tests and grade.
Duration: December 1964-1966.
Investigator(s): S. Oliver Roberts, Ph.D., Chairman, Department of Psychology, and staff, Fisk University, Nashville 8, Tenn.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-U-35 RELATIONSHIP OF CHILDHOOD AND FAMILY BACKGROUND FACTORS TO PERSONAL AND HETEROSEXUAL ADJUSTMENT OF COLLEGE STUDENTS

Purpose: To determine nature and significance of family love and affection, parental discipline, and childhood associations and their relationship to personal and heterosexual adjustment of college students.
Subjects: 400 college males; 400 college females.
Methods: Personality tests, marital prediction inventories, and depth interviews.
Duration: January 1963-December 1964.
Investigator(s): Clifford R. Adams, Ph.D., Professor of Psychology, and David Shope, M.S., Rehabilitation Counselor, Pennsylvania State University, University Park, Pa.

18-U-36 RELATION OF ACCIDENT EXPERIENCE OF HIGH SCHOOL STUDENTS TO THAT OF THEIR FAMILIES

Purpose: To determine whether the family influences accident rates.
Subjects: 6,000 high school sophomores.

Methods: Questionnaire, group administered in classroom.
Duration: Spring 1963-spring 1965.
Investigator(s): William G. Mather, Ph.D., Research Professor of Sociology, Pennsylvania State University, University Park, Pa.

Child-rearing attitudes and practices

18-V-1 COMPARATIVE STUDY OF CHILD-REARING PATTERNS

Purpose: To make a comparative study of child-rearing patterns in European countries and in the United States.
Methods: Selected communities are being studied from an ethnological viewpoint; historical implications are also being evaluated.
Duration: 1955-1967.
Investigator(s): Alfred McClung Lee, Ph.D., Professor of Sociology and Anthropology, Brooklyn College, City University of New York, Brooklyn 10, N. Y.
Cooperating group(s): Graduate Division, Brooklyn College.

18-V-2 CHILDHOOD IN A PANTAGAMOUS SOCIETY

Purpose: A behavioral scientific analysis of child-rearing practices of nineteenth century Noyesian Perfectionists.
Methods: Case study materials from secondary and primary sources (personal documents: diaries, autobiographies, personal letters, etc.). Behavioral analysis of case study materials.
Findings: Assumption that monogamous kind of parent-child relationships are necessary for mental health is not supported by preliminary findings.
Duration: 1963-1965.
Investigator(s): Robert M. Frumkin, Ph.D., Research Editor, Journal of Human Relations, 3427 Dellwood Rd., Cleveland, Ohio 44118.
Publication: Research monograph to be published.

18-V-3 CHILD CARE PROVIDED BY MOTHERS IN SOUTH CAROLINA, PHASE III

Purpose: To obtain information about care of preschool and elementary school children provided by mothers in South Carolina. To test the hypotheses that there is a difference in child care provided in South Carolina by: (1) substitutes for employed mothers and mothers who do not work outside the home; (2) mothers who are employed in mills and mothers who are employed in professional occupations; and (3) employed mothers of preschool children and employed mothers of elementary school children. To identify the modal kinds of reorganizations of families when mothers work. To compare child care patterns in South Carolina with patterns in Massachusetts as reported by Sears, Maccoby, and Levin in Patterns of Child Rearing.
Subjects: 91 mothers randomly selected from each of 34 counties.
Methods: Instrument used by Sears, Maccoby, and Levin was employed. Interviews were taped by home demonstration agents who had been trained to conduct interview record on tape which was coded and analyzed.
Duration: 1962-August 1964.
Investigator(s): Kathryn Summers Powell, Ph.D., Professor of Home Economics, Winthrop College, Rock Hill, S. C.
Cooperating group(s): Clemson-Winthrop Home Economics Research Council.
Publication: Experiment Station Bulletin (Clemson University).

18-V-4 IMPACT OF PARENTAL EXPERIENCE UPON PARENTAL CHILD-REARING ATTITUDES

Purpose: To ascertain whether scores of persons on certain attitudinal dimensions changed after the experience of parenthood.
Subjects: 67 former undergraduate psychology students, enrolled at Michigan State University, 1956-1957, who are, for the most part, parents.
Methods: Child-rearing attitude scales administered in 1956-57 and readministered in 1963. Differences between pre-parental and post-parental scores were evaluated for statistical significance.
Findings: After parenthood, subjects became significantly more rejecting and more overprotective toward their children. Occupation influenced changes, with parents engaged in psychologically-oriented professions showing more favorable attitudes than others.
Duration: 1963-1964.
Investigator(s): John R. Hurley, Ph.D., Associate Professor, and Lois Q. Williams, M.A., Department of Psychology, Michigan State University, East Lansing, Mich.
Publication: To be published in either *Journal of Consulting Psychology* or *Child Development*.

18-V-5 CHILD TRAINING AND MOTIVATIONAL DEVELOPMENT

Purpose: To investigate child training antecedents of the development of motive to achieve and motive to avoid failure; to study manifestation of these motives in classroom behavior of the child with special reference to use of programmed learning materials presented in a self-direction learning situation.
Methods: A distinction is made between training for achievement and training for independence; a curvilinear relationship between age of demands for independence and achievement and strength of achievement motivation is expected with low need for achievement being associated with very early or very late demands. Parents' motives and value orientations, and identification of the child with his parents will also be measured, and influence of these variables on development of achievement related motives investigated.
Investigator(s): Charles Philip Smith, Ph.D., Assistant Professor of Psychology, Princeton University, Princeton, N. J.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-V-6 PATTERNS OF MATERNAL CHILD-REARING CONTROL AND SUBSEQUENT EFFECTS OF AVERSIVE SOCIAL REINFORCEMENTS UPON COGNITIVE PERFORMANCE OF MALE OFFSPRING

Purpose: To investigate whether combined ratings of maternal control and nurturance would be predictive of concept formation performance under conditions of mild failure and including negative social reinforcement.
Subjects: 63 college undergraduate males.
Methods: Psychometric ratings of maternal child-rearing control and nurturance were obtained under group conditions. Subjects, recalled individually, were given the Wisconsin Card Sorting Test by a female examiner similar in age to their actual mothers. Card decks of increased difficulty were used to elicit greater failure experiences, and the technique involved examiner's emitting the negative reinforcer "wrong".
Findings: As predicted, the low control-high nurturant mother group (highest mediated self-esteem) performed better than the high control-low nurturant mother group (lowest mediated self-esteem). The high control-high nurturant and low control-low nurturant groups were intermediate in performance.
Duration: October 1963-February 1964.
Investigator(s): Alfred B. Heilbrun, Jr., Ph.D., Visiting Associate Professor

of Psychology, and Helen K. Orr, B.A., University of California, Berkeley 4, Calif.
Publication: Submitted to Journal of Abnormal Psychology.

18-V-7 CHILD REARING AND BEHAVIOR PROBLEMS OF PRESCHOOL CHILDREN IN CALIFORNIA

Purpose: To provide normative data on child-rearing practices and preschool behavior problems; to explore relationship between child-rearing practices and behavior problems in preschool children.
Subjects: Two stratified cluster samples of preschool children's families: 809 families covering the State of California; 812 covering the metropolitan county of Contra Costa.
Methods: Household interviews with mothers; comparative use of findings in both samples; cluster analysis of child-rearing and behavior variables.
Findings: Preliminary findings point up critical influence of mother's education on child-rearing practices and effect of type and frequency of punishment on behavior.
Duration: 1962-1964.
Investigator(s): Martin I. Heinstein, Ph.D., Research Psychologist, Bureau of Maternal and Child Health, California State Department of Public Health, Berkeley 4, Calif.
Cooperating group(s): Bureau of the Census, U. S. Department of Commerce; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-V-8 THE MATRIARCHAL HOME: A DILEMMA OF FOSTER HOME CARE

Purpose: To determine whether Negro foster homes studied are matriarchal. If homes are matriarchal, to determine whether the mother treats boys differently from girls. To determine whether there is a significant difference in manner and success of adjustment between the two sexes.
Subjects: 34 foster mothers; 34 Negro boys and 34 Negro girls, 7.6 years to 13.6 years, in long-term care, in the present foster home 2 years or more, and taken from population of the Division of Foster Home Care, New York City Department of Welfare.
Methods: For children, test battery was administered consisting of WISC, Draw-A-Man, Draw-A-Family, and Rorschach; for mothers, family drawing, questionnaire, and Rorschach were used. Statistics were based on "t" test for I.Q. and Chi-square for other material. Findings of boys versus girls were compared; preferences of mothers concerning sex of child were compared; statistical treatment noted possible correlations between mother's pattern and child's adjustment.
Findings: (1) In WISC girls were significantly higher in digit span (1 percent level) and coding (7 percent level). No other significant differences in verbal, performance, full scale I.Q., or nine other subtests; no significant difference in scatter. (2) No significant difference in location, determinants, or content in children's Rorschach or drawing; children's dynamics similar. (3) Mother's Rorschach results, using most acceptable "norms", suggest substantial pathology. Mother's preference for girl children significant well beyond 1 percent level. No correlation between mother's Rorschach and children's patterns of functioning.
Duration: September 1962-November 1964.
Investigator(s): Janet Nisselson (Ph.D. Candidate, Graduate School of Education, Yeshiva University), Psychologist, Division of Foster Home Care, New York City Department of Welfare, New York, N. Y.

18-V-9 TEACHING PARENTS PSYCHOLOGICAL PRINCIPLES FOR CHILD REARING

Purpose: To teach parents psychological principles (e.g., reinforcement, extinction, etc.) so that these particular concepts can be of use to parents in understanding and in modifying their children's behavior.
Subjects: Parent groups from elementary schools, mental health clinics, and a day school.
Methods: Lecture method is used in which experimenter lectures to parents for ten one-hour sessions. First four sessions focus on teaching particular principles and defining terms. Second group of sessions is to consist of presentation of studies in which these principles have been used to modify behavior of children. In last group of sessions parents present particular problems that concern them; the group, under guidance of experimenter, helps parent work on problem, using techniques discussed earlier. Effect of method will be evaluated in several ways, the two major ones being use of the Maryland Parent Attitude Survey administered before and after the sessions, and use of a questionnaire at end of sessions to determine parents' feelings toward value of sessions and instances in which they have been able to use techniques discussed.
Duration: February-September 1964.
Investigator(s): Donald K. Pumroy, Ph.D., Associate Professor of Psychology, University of Maryland, College Park, Md.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

SOCIAL, ECONOMIC, AND CULTURAL INFLUENCES

18-W-1 AN ANALYSIS OF THE CROSS-CULTURAL STUDY OF CHILDREN'S SOCIAL BEHAVIOR

Purpose: To determine the extent and nature of cross-cultural dimensions of social behavior of children; to discover the cross-cultural relations existing between mothers' self-reports of their child-training practices and observed social behavior of their children.
Subjects: 134 children in 6 different societies selected from United States, Mexico, India, Philippines, Okinawa, and Africa.
Methods: Behavior of subjects observed, recorded, coded by field teams, and prepared for computer analysis. Mothers of subjects interviewed with regard to family life and child-training practices; data from these interviews were independently analyzed. By means of factor analysis and other statistical techniques, social behavior of children (e.g., dominance, nurturance, responsibility) will be internally analyzed and then related to variables in mother interviews (e.g., responsibility training, mother affect).
Duration: January 1963-December 1964.
Investigator(s): Richard Longabaugh, Assistant Professor of Psychology and Sociology, William Lambert, Ph.D., Professor of Psychology, Sociology, and Anthropology, Cornell University, Ithaca, N. Y.; Allen Ellis, Ph.D., IBM Postdoctoral Research Fellow, Graduate School of Education, Harvard University, Cambridge, Mass.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

18-W-2 A CROSS-CULTURAL STUDY OF ADOLESCENT SOCIETIES

Purpose: To compare the bases for formation and maintenance of "adolescent societies" under differing cultural conditions. Principal objective is to test several hypotheses derived from theoretical concepts and empirical findings on American "adolescent societies" and analyses of the Danish culture.
Methods: Danish adolescent subcultures will be described in detail and systematically compared to various adolescent societies in the United States. Implications of these comparisons for secondary education in both countries will be discussed. Special care will be given to selecting Danish samples which represent true counterparts to the American samples, adapting Coleman's techniques so that observed differences between adolescent subcultures can be attributed to real differences in the relative impacts of cultural conditions rather than differences in meanings of words used in the assessment instruments, and collecting additional background data on American samples to facilitate the derivation of explanations of cross-cultural differences. In addition to Coleman's samples, a number of American high schools which require qualifying examinations will be included in order to control for this selective factor in comparing the adolescent subcultures. Statistical comparisons will be made to test hypotheses which predict several dimensions of difference between adolescent societies in America and Denmark.
Duration: October 1963-October 1966.
Investigator(s): Gerald S. Lesser, Ph.D., Director, Laboratory of Human Development, Harvard University, Cambridge 38, Mass.
Cooperating group(s): Cooperative Research Branch, Office of Education, U. S. Department of Health, Education, and Welfare.

18-W-3 A COMPARATIVE STUDY OF CHILDREN'S ALLOWANCES IN CANADA, GREAT BRITAIN, THE SOVIET UNION, AND FRANCE

Purpose: To analyze the social impact of children's allowances on the welfare of children.

Methods: Library research and field studies in the four countries involved.

Duration: Summer 1964-summer 1966.

Investigator(s): Bernice Madison, Ph.D., Chairman, Department of Social Welfare, San Francisco State College, San Francisco, Calif.

18-W-4 CROSS-CULTURAL STUDY OF SOCIAL CONTROL

Purpose: To study cultural differences in sensitivity to social approval and disapproval as techniques of social control of behavior, with particular reference to child-rearing antecedents.

Subjects: Elementary and high school students in Florida and Caribbean and Latin American islands.

Methods: Special assessment of incentive value of social approval and disapproval; retrospective report of perceived parental attitudes; some direct assessment of parental attitudes and practices.

Duration: June 1964-December 1965.

Investigator(s): John W. McDavid, Ph.D., Associate Professor of Psychology, University of Miami, Coral Gables, Fla.

Publication: To be submitted for publication.

18-W-5 DEVELOPMENT OF CONCEPTS OF WOMEN'S ROLE: A JAPANESE-AMERICAN SAMPLE IN HAWAII

Purpose: To understand the perceptions of male and female roles held by children at different developmental levels and in varying cultural milieus.

Subjects: Elementary school girls, 8 to 11 years old, of Japanese ancestry.

Methods: Structured interviews and recording of reactions to drawings and photographs depicting role situations of both men and women.

Duration: Summer 1964-summer 1965.

Investigator(s): Hazel V. Kraemer, Ph.D., Professor of Child Development and Family Study, University of Hawaii, Honolulu, Hawaii.

Cooperating group(s): Faculty Research Fund, University of Hawaii.

Publication: To be submitted for publication.

18-W-6 QUANTITATIVE AND QUALITATIVE COMPARISON OF JAPANESE AND AMERICAN FIGURE DRAWINGS

Purpose: An empirical study and attempt to designate some of the reasons for differences that may appear in the two sets of drawings.

Subjects: Sample of Japanese children, 8 to 12 years of age, in a special class; sample of American children of same chronological ages taken from an institution for the mentally retarded and a public school special class.

Methods: Correlations will be run on I.Q.'s and M.A.'s as obtained on the Draw-a-Person and other standard measures of intelligence (Stanford-Binet) by both groups of subjects. A qualitative analysis will be made to determine possible cultural differences in drawings.

Duration: June-August 1964.

Investigator(s): Ivan Z. Holowinsky, Ed.D., Chief Clinical Psychologist, and Mall Vahar, M.A., Psychologist, Training School, Vineland, N. J.; and Naohiko Fukada, Assistant Professor of Psychology, Doshisha Women's College, Japan.

Publication: To be published in August issue of Training School Bulletin, Vineland, N. J.

18-W-7 CULTURAL DEPRIVATION IN A PAIUTE INDIAN POPULATION

Purpose: To investigate whether cultural deprivation inhibits success in school.
Subjects: 100 Paiute Indian children.
Methods: Longitudinal observations including pediatric, neurological, psychological, and sociological factors.
Duration: July 1963-1968.
Investigator(s): Richard Koch, M.D., Director, Child Development Clinic; Karol Fishler, Ph.D., Chief Clinical Psychologist; and Gayle Goldschmidt, ACSW, Children's Hospital, Los Angeles, Calif.

18-W-8 PATTERNS OF PERCEPTUAL AND LANGUAGE FUNCTIONING IN CHILDREN WITH COGNITIVE DEFICIT

Purpose: To compare patterns of functioning in the two broad areas of perceptual and language functioning; to relate these patterns to social background and experiential variables.
Subjects: Approximately 70 first grade children from slum environments. Half the children will have been through a planned preschool enrichment program; half will not.
Methods: The Illinois Test of Psycholinguistic Ability, plus two Institute-developed language tests for the linguistic area; a revised form of a very extensive visual, auditory, and tactile perceptual test battery devised at the Institute; socio-economic status measures (the Institute SES index); several concept-formation measures, such as those devised by Kendler and by Osler.
Duration: June 1964-May 1967.
Investigator(s): Cynthia P. Deutsch, Ph.D., Associate Professor and Senior Project Coordinator, Institute for Developmental Studies, Department of Psychiatry, New York Medical College, 106th St. and Fifth Ave., New York, N. Y.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: To be published in professional journals upon completion of study.

18-W-9 THE RELATIONSHIP OF CREATIVITY TO SOCIAL CLASS

Purpose: To investigate the relationship between various factors of creativity and the socio-economic position of school age children.
Subjects: Approximately 450 Negro and white middle socio-economic children and approximately 450 Negro and white lower socio-economic children in grade 5 in the Pittsburgh Public Schools.
Methods: Socio-economic circumstances of all subjects will be evaluated, using the Index of Status Characteristics. Scores from eight test evaluating factors of creativity will be compared between subjects from various socio-economic situations. I.Q. and achievement will be controlled.
Duration: November 1963-July 1965.
Investigator(s): Robert M. Smith, Ed.D., Assistant Professor, Department of Special Education and Rehabilitation, University of Pittsburgh, Pittsburgh, Pa. 15213.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Journal articles of final report.

BEST COPY AVAILABLE

18-W-10 EDUCATIONAL STATUS AND SOCIOECONOMIC CHARACTERISTICS OF FARM AND NONFARM YOUTH IN THE UNITED STATES, 1960

Purpose: To describe variations in school dropout rates and school retardation rates among farm and nonfarm youths; to analyze social and economic characteristics associated with the variations.
Subjects: Persons 16 to 24 years old in the United States.
Methods: Application of standard statistical techniques to data contained in the Subject Reports of the U. S. Census of Population, 1960.
Findings: Preliminary data show substantial differences in measures of educational statistics associated with residence, color, ethnic background, income, and education of the young person's family.
Duration: April 1964-August 1965.
Investigator(s): James D. Cowhig, Ph.D., Head, Levels of Living Section, Farm Population Branch, U. S. Department of Agriculture, Washington, D. C.
Publication: Results probably will be published in an Agricultural Economic Report by the U. S. Department of Agriculture.

18-W-11 A STUDY OF ISOLATED FAMILIES AND COMMUNITIES

Purpose: To specify some psychological and sociological consequences of geographical isolation.
Subjects: Residents of three different Norwegian localities which were selected on basis of: (1) occurrence of families and homesteads without immediate neighbors; and (2) location in communities far removed from cities or densely populated rural regions. In one community, Lappish-speaking minority group was singled out for specific analysis.
Methods: Consequences of the two types of isolation on personality formation of children are studied by variety of tests. Results are compared to results obtained on matched samples of children in city and in nonisolated community. By sociological methods, interviewing, and participant observation, an attempt is made to determine most significant interaction patterns within isolated communities and across borders to "central society."
Duration: May 1961-May 1966.
Investigator(s): Vilhelm Aubert, Ph.D., Professor, and staff, Institute for Social Research, Fuglehauggt. 6, Oslo, Norway.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-W-12 A QUANTITATIVE STUDY OF ENVIRONMENTAL CHANGE OVER A DECADE WITHIN AN AMERICAN AND AN ENGLISH TOWN

Purpose: To study how the environment which a community imposes upon its inhabitants changes over time; specifically, to discover nature and measure extent of change over the period 1954-1955 to 1963-1964 in the public (nonfamily) environments which the towns of Midwest, Kansas and Yoredale, Yorkshire provided for their inhabitants. Baseline data are provided by research carried out in Midwest and Yoredale in 1954-1955 in connection with a cross-cultural study of the community environments of children of the two towns (Bulletin 9, Research Relating to Children). In the earlier study, it was found that American children and adolescents at all ages entered more of their town's settings and were less segregated from people of all ages than were English children.
Methods: Identical field procedures to replicate original study will be used. Environmental change over the decade will be measured in terms of births and deaths in behavior settings, changes in attributes of the continuing behavior settings of the towns, and changes in the occupancy of settings with designated attributes. For 47 environmental attributes, such questions will be raised as:

"Has the number of behavior settings of Midwest and Yoredale in which formal education is prominent increased or decreased in the decade?" "Has the change occurred equally for inhabitants of all ages, sexes, and social classes?"
Duration: June 1963-August 1965.
Investigator(s): Roger G. Barker, Ph.D., Professor of Psychology, University of Kansas Midwest Field Station, Oskaloosa, Kans., and Phil Schoggen, Ph.D., Associate Professor of Psychology, University of Oregon, Eugene, Oreg. (Reported by Louise S. Barker, Research Associate, University of Kansas Midwest Field Station.)
Publication: Chapters 7 and 8, The Stream of Behavior; probably book form in 1966.

18-W-13 SOCIAL IMPACT STUDY OF URBAN RENEWAL

Purpose: To examine various facets of impact of urban renewal programs in urban life and life styles of Negro poor in relation to possible helping programs, including school-community relations in a poor Negro neighborhood, impact of relocation on children, limits of cultural heterogenity in schools, and unemployed Negro youth.
Methods: Survey research; school observation and interviews with school personnel; use of school records; participant observation in poor Negro neighborhoods.
Duration: January 1964-February 1965.
Investigator(s): Charles Lebeaux, Ph.D., Professor, School of Social Work, and Eleanor P. Wolfe, Ph.D., Associate Professor of Sociology and Anthropology, Wayne State University, Detroit, Mich.
Cooperating group(s): City of Detroit.
Publication: Initial report to City of Detroit, February 1965; further report, April 1965.

18-W-14 EDUCATIONAL BARRIERS TO ECONOMIC SECURITY IN LARGE CITIES

Purpose: To identify the extent, distribution, and social and economic correlates of premature withdrawal from high school and adult functional illiteracy.
Subjects: High school population, 14 to 19 years, and adult population, 25 years and older, in 131 of the largest cities in the United States.
Methods: Correlation and regression analysis.
Duration: September 1963-August 1964.
Investigator(s): Robert A. Dentler, Ph.D., Executive Officer, and Mary Ellen Warshauer, M.A., Research Assistant, Institute of Urban Studies, Teachers College, Columbia University, New York 27, N. Y.
Cooperating group(s): Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: To be published by Teachers College Bureau of Publications in January or February 1965.

18-W-15 ORIENTATIONS TO WORK AMONG TEENAGERS

Purpose: (1) To describe the cognitions of teenagers regarding nature of work, play, competence, achievement, etc.; (2) to determine social factors related to differences in meanings of these work-orientation components; and (3) to determine which components commonly cluster to form representative work orientations.
Subjects: Over 1200 teenagers varying in age, sex, social class, race, religion, and geographical residence; in addition, a subsample of Puerto

Ricans and institutionalized delinquents.
Methods: Three questionnaire-inventory type instruments employed.
Duration: June 1963-not reported.
Investigator(s): Ronald Lippitt, Ph.D., Professor of Psychology, Institute for Social Research, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): National Science Foundation.

18-W-16 FACTORS AFFECTING CAREER CHOICES OF ADOLESCENTS: A CROSS-CULTURAL STUDY OF COGNITIVE STRUCTURES USED IN ORGANIZING POSSIBILITIES

Purpose: To obtain knowledge about the varieties of cognitive structures adolescents use in thinking about possibilities and making choices; to obtain evidence on validity of several new assessment techniques potentially useful to counselors.
Methods: Two communities will be selected, one in the Netherlands and one in the United States, matched for size and general occupational characteristics. A questionnaire and group tests will be administered to students in the ninth grade and its Dutch equivalent; a sample of 48 Dutch students and approximately 96 American students, matched for sex, social level, and church status will be selected. Subjects will be interviewed about choices and decisions; individual tests regarding choices, values, and cognitive structures will be administered, and daily activity records will be obtained. By means of statistical procedures, composition of these groups with regard to sociological and cultural variables (sex, social status, religion, and nationality) will be studied and compared with regard to psychological variables obtained in group and individual testing. Procedures used will be evaluated to determine which were best indicators of significant individual styles of valuing and choosing.
Duration: January-December 1964.
Investigator(s): Leona Tyler, Ph.D., and Norman D. Sundberg, Ph.D., Associate Professors of Psychology, University of Oregon, Eugene, Oreg.
Cooperating group(s): Cooperative Research Branch, Office of Education, U. S. Department of Health, Education, and Welfare.

18-W-17 YOUTH EMPLOYMENT SURVEY, CENSUS TRACT 34

Purpose: To gather data on education, delinquency, employment, and mobility of all 16 to 20 year olds living in census tract 34.
Methods: Door-to-door survey undertaken by volunteers.
Findings: One-third of labor force was unemployed; 37 percent of males and 29 percent of females were out of work. Unemployment for Negro females was three times as great as for white females. Nine out of ten would like more help in finding work. Two dropouts were found for every high school graduate within the tract; white dropouts left school at lower grades than did Negro dropouts. Eighty-six percent of dropouts had moved in last five years; forty-eight percent of graduates had moved. Three out of ten youngsters interviewed had police or court records; over half of the male dropouts had records; none of female graduates had records.
Duration: September 1962-October 1963.
Investigator(s): Richard W. Faunce, M.A., and staff, Youth Development Project Washington School, Chicago at 6th St., Minneapolis, Minn. 55415. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1963-1964.)
Cooperating group(s): Northside Youth Development Council; Community Health and Welfare Council of Hennepin County, Inc.; President's Committee on Juvenile Delinquency and Youth Crime.
Publication: Multilith report by Youth Development Project.

18-W-18 UNMARRIED MOTHERHOOD AMONG NEGROES

Purpose: To study attitudes toward illegitimately pregnant Negro girls, their parents, and the staff involved in serving them; to identify different patterns of normative expectations which develop in the Negro community and which appear to lead the young Negro girl into this form of deviant behavior; to examine the influence of variables other than race.
Subjects: Potential populations are available for study through Salvation Army services in Buffalo, Cincinnati, and Cleveland.
Methods: During nine-month period, project director, working with a consultant and staff, obtains detailed description of population served from case records; three questionnaire instruments have been administered in two of institutions for unmarried mothers run by Women's Social Service Department, Eastern Territory of the Salvation Army; three interview schedules are being pretested.
Duration: April 1963-September 1964.
Investigator(s): Hope J. Leichter, Ph.D., Russell Sage Foundation, 505 Park Ave., and Jewish Family Service Inc., 113 W. 57th St., and Deborah Shapiro (D.S.W. Candidate, New York School of Social Work), Research Consultant, Women's Social Service Department, Eastern Territory of The Salvation Army, New York, N. Y.
Cooperating group(s): Research Center, New York School of Social Work, Columbia University; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-W-19 ORIENTATION TO LIFE IN A COMMUNITY OF THE BLIND

Purpose: To focus on specific problem of how children orient themselves to the expectation of loss of sight and how adults continue to work after becoming blind; to accumulate material on systematic perception of culture when one modality (sight) is missing in anthropologist himself. Findings should have wider application to all those conditions, whether somatic or associated with socially deprived environment, where children are reared with narrow expectations of what future must be, as compared with the wider society.
Subjects: Inhabitants of Rincon area, Oaxaca, Mexico, where onchocercosis threatens blindness; infection reaches as high as 90 percent in some areas according to the Department of Health of Mexico.
Investigator(s): Margaret Mead, Ph.D., Associate Curator, Department of Anthropology, American Museum of Natural History, Central Park W. and 79th St., and John Langston Gwaltney, Graduate Student, Columbia University, New York 27, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-W-20 SELECTIVE CRITERIA AND TELEVISION VIEWING BY PUBLIC AND PAROCHIAL SCHOOL CHILDREN

Purpose: To measure attitudes as well as socio-psychological factors as they influence children's television viewing; to reveal children's ideas concerning perception and analysis of these programs.
Subjects: Approximately 5,000 to 10,000 public and parochial school children, 10 to 17 years of age.
Methods: Questionnaires, interviews, and appropriate statistical techniques (correlations and tests of significance) utilized.
Duration: Summer 1964-summer 1966.
Investigator(s): Joseph K. Balogh, Ph.D., Professor of Sociology and Criminology, Bowling Green State University, Bowling Green, Ohio, and Marc Riedel, M.A., Concord College, Athens, W. Va.

18-W-21 FILM EFFECTS ON CHILDREN'S ATTITUDES

Purpose: To gauge effect of selected film in making for change in perceptual field and attitudes toward basic democratic concepts.
Subjects: 85 boys and 68 girls in grades 7 through 9 attending a public junior high school.
Methods: Use of questionnaire and open end space for written-in comments of children prior to viewing film ("Neighbors", Canadian Film Board). Film shown, same form filled again by subjects with three additional questions based on context of film.
Findings: Broader participation on second set of questionnaires, after seeing film. Room for written comments utilized by the children again after seeing film, proving to be a vehicle for an explicit interaction between subjects and researcher. Comments written gave indications of both affective and cognitive states. To statistically ascertain degree of validity in leanings toward a sex and maturational differential present between seventh and ninth grades, it is suggested the study be repeated with larger sample at ninth grade, including an equal distribution of boys and girls. Design seems applicable to basic research at classroom level, providing a framework to gauge interaction both to new experience and to further growth.
Duration: June-July 1964.
Investigator(s): Ann Nowell, Ed.D., Certified Psychologist, P. O. Box 61, Carmel Valley, Calif.
Cooperating group(s): Carmel Unified School District.
Publication: Information available from investigator or Turn Toward Peace, Pacific Central Region, 1730 Grove St., Berkeley 9, Calif.

18-W-22 THE IDEAL FATHER IMAGE HELD BY HOME ECONOMICS TEACHERS COMPARED TO THE IMAGE OF THE FATHER PORTRAYED ON COMMERCIAL TELEVISION'S FAMILY SERIALS

Purpose: To evaluate commercial television for its use in family life education.
Subjects: High school students.
Methods: TV fathers rated on semantic differential.
Findings: Television image of the father is weak, ineffectual, but moral.
Duration: September 1963-July 1964.
Investigator(s): Xenia F. Fane (Ph.D. Candidate), Chairman, Home Economics Department, Prospect Heights High School, Brooklyn, N. Y.

HEALTH SERVICES

18-X-1 DIAGNOSTIC CENTER PROJECT

Purpose: To establish a diagnostic testing center for purpose of evaluating preschool children who are suspected of having a hearing loss or who exhibit a lack of speech and language or delay in speech and language development.
Subjects: Preschool children referred by medical, psychologic, or educational personnel.
Methods: A multi-disciplined approach is to be used in testing; members of testing team will include a clinical psychologist, a speech pathologist, and an audiologist, as well as a pediatric consultant. Routine for each child will be as follows: (1) intake interview with parents, during which time child will be observed in a clinic "playroom"; (2) pediatric examination; (3) audiological evaluation including gross sound tests, play audiometry, speech audiometry, and electro-dermal audiometry, if indicated; (4) speech and language evaluation including speech assessment (phonetic evaluation), oral examination, evaluation of use of symbols (Goldstein-Scheer Form-Color test), and evaluation of auditory, visual, and "inner" language abilities; and (5) psychological evaluation including Vineland Social Maturity Scale, appropriate tests of intellectual capacity (Cattell, Draw-A-Man, Leiter Scale, Stanford-Binet and Grace Arthur), evaluation of visual-motor function, and evaluation of motor performance. If indicated, observation in a semi-structured therapy situation will be undertaken. Therapy or appropriate referrals for further examinations will then be made. The project will be evaluated in two ways, the first involving an enumeration of the number of youngsters referred to the center, the second dealing with reliability and validity of diagnostic procedures. Such an evaluation will be accomplished by follow-up studies of children seen. Also, children residing in immediate area will be enrolled in an evaluative therapy program in speech and hearing clinic. A randomly selected sample will be rescheduled for recheck testing within six months after their initial visit. Factorial analyses will be made of all test data to determine most reliable tests and test items.
Duration: September 1964-August 1966.
Investigator(s): John J. O'Neill, Ph.D., Professor and Director, Speech and Hearing Clinic, and Earl Stark, Ph.D., Assistant Professor, University of Illinois, Champaign, Ill.

18-X-2 THE EFFECTS OF HEALTH EDUCATION AND TUBERCULIN TESTING ON SCHOOL CHILDREN'S BELIEFS ABOUT TUBERCULOSIS

Purpose: To evaluate information and attitudes changed by tuberculosis education and tuberculin testing in the public schools.
Subjects: In pilot study, 510 public school children, grades 5 and 6, in one school district in St. Louis County; in final stage of study, 633 children, grade 6, in another public school district in St. Louis County.
Methods: In pilot study, an instrument was developed containing 84 true-false items to be scored on four variables: accuracy of beliefs about TB, belief in susceptibility of persons to TB, belief in severity of consequences of getting TB, and belief in benefits of taking action to prevent or diagnose TB. Another instrument was developed to enable comparison of beliefs about TB with beliefs about other diseases. In final study, the first measure was administered to four groups: children prior to tuberculin testing who had been taught about TB, children who had neither been taught nor tuberculin tested, children who

had been tuberculin tested but not taught about TB, and children who had had both experiences.
Findings: All three groups who had either been tuberculin tested, taught, or both scored lower on belief in susceptibility and belief in severity than the control group which had had neither experience. Both tuberculin tested groups scored higher on belief in the benefits of protective actions against TB than did the non-tuberculin tested groups. Overall accuracy was greater for the tuberculin tested groups than the control group; other differences were not significant.
Duration: October 1962-August 1964.
Investigator(s): Samuel L. Guskin, Ph.D., Research Project Director, St. Louis County Health Department, Clayton, Mo.
Cooperating group(s): Tuberculosis and Health Society of St. Louis.
Publication: To be submitted to a professional journal.

18-X-3 A STUDY OF PARENTS' REACTIONS TO A HEART SOUND SCREENING PROGRAM FOR CHILDREN

Purpose: To systematically assess parents' reactions to written materials concerning a heart sound screening program as well as their reactions to the program itself.
Subjects: 41 parents living in the Washington, D. C. area who have children in grade school and high school.
Methods: Personal interviews were carried out with each parent using a structured interview schedule as well as a number of open-ended questions.
Findings: A number of communication problems were identified and parents' perceptions and attitudes toward the program were defined. Specific informational needs of parents were described as well as various issues of interest and concern to them, including factors relating to the child's health status, the program's purpose, procedures and results, the parent's role in the program, and general information about heart disease.
Duration: June 1963-June 1964.
Investigator(s): Fred Heinzelmann, Ph.D., Research Psychologist, Behavioral Science Section, Division of Community Health Services, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington, D. C. 20201.
Publication: Mimeographed reports available from the Heart Disease Control Branch, Division of Chronic Diseases, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington, D. C.

18-X-4 SCREENING AUDIOMETRY

Purpose: To determine efficiency of single-frequency testing.
Subjects: Patients in Children's Orthopedic Hospital.
Methods: Pure tone audiometry.
Duration: January-December 1964.
Investigator(s): Clair N. Hanley, Ph.D., Associate Professor of Speech, University of Washington, Seattle, Wash.
Publication: To be published by American Speech and Hearing Association.

18-X-5 THRESHOLD TESTING OF THREE YEAR OLD CHILDREN WITH NORMAL HEARING

Purpose: A follow-up of early infant screening done on three, four, and five month old children formerly seen at the University of Kansas Medical Center as a part of early infant screening.
Subjects: 46 subjects equally divided between sex, predominantly Negro.
Methods: Children are being tested in a puretone by air for 250 cps., 500 cps., 1000 cps., 2000 cps., 4000 cps., and 8000 cps.

Findings: Thus far, children's hearing ranged between -10 db. and 0 db.
Investigator(s): June Miller, Ed.D., Educational Director, Medical Center, University of Kansas, Kansas City, Kans. 66103.

18-X-6 SCHOOL HEALTH SERVICES IN A NORTH CAROLINA COMMUNITY

Purpose: To learn how a school system in a given community sees and carries out its role in the provision of health services.
Subjects: Winston-Salem/Forsyth County consolidated school system.
Methods: Loosely structured interviews with selected, representative members of the school system, health department, and community to get a complete picture of both theoretical and practical aspects of the school health program and how it relates to other health programs in the community.
Duration: May-December 1964.
Investigator(s): Sidney S. Chipman, M.D., M.P.H., Professor and Chairman; Naomi M. Morris, M.D., M.P.H., Assistant Professor; and E. Barbara Stocking, M.P.H., Associate Professor, Department of Maternal and Child Health, School of Public Health, University of North Carolina, Chapel Hill, N. C.
Cooperating group(s): Community Health Services Division, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-X-7 THE ROLE OF THE PSYCHIATRIST IN THE PUBLIC SCHOOL

Purpose: To evaluate dynamics and techniques of handling school problems in the school when psychotherapy must be brief.
Subjects: Students, parents, teachers, administrators, and guidance and school adjustment personnel.
Methods: Individual, family, and group evaluation and discussion.
Findings: (1) The school community is adaptable; change facilitates education of student. (2) Schools are eager for help. (3) The psychiatrist must go to and work in the school.
Duration: January 1962-indefinite.
Investigator(s): Edward M. Daniels, M.D., Clinical Associate in Psychiatry, Harvard University, Cambridge, Mass.

18-X-8 A SCHOOL MENTAL HEALTH CONSULTATION PROGRAM

Purpose: To develop and demonstrate an efficient method by which local community mental health centers can provide, through consultation with school personnel, a preventive mental health program in the public schools which will effect a reduction in incidence and severity of mental health problems of school children, to develop methods for staff training in consultation techniques; to develop and apply methods for assessment of mental health of the school child; to describe and analyze the procedures for establishing an effective consultant-consultee relationship; and to test various patterns of consultant services to schools.
Investigator(s): Raymond D. Fowler, Jr., Ph.D., Associate Professor, Michael Dinoff, Ph.D., Lecturer, Jerry M. O'Donnell, Ph.D., Associate Professor, and Hally W. Vernon, M.A., Instructor, Department of Psychology, University of Alabama, University, Ala.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-X-9 SYMPTOMS OF PSYCHOLOGICAL PROBLEMS IN SPEECH CLINIC CASES

Purpose: To assess the overlap between child guidance clinic and speech clinic cases; to then consider implications for services and training.
Subjects: Caseload of Speech Clinic of Childrens Hospital of Pittsburgh for one year.
Methods: Data concerning children will be collected; appropriate comparisons with work previously finished will then be made.
Duration: June 1964-June 1965.
Investigator(s): Doris Bradley, Ph.D., Director, Speech Clinic, Children's Hospital of Pittsburgh, H. Lee Wylie, M.D., Medical Director, and Martin R. Gluck, Ph.D., Chief Psychologist, South Hills Child Guidance Center, 300 Mt. Lebanon Blvd., Pittsburgh, Pa. 15234.
Publication: To be submitted to speech and clinical child psychology or psychiatry journals.

18-X-10 LINCOLN HOSPITAL MENTAL HEALTH SERVICES

Purpose: To develop a comprehensive community mental health center and a training facility in community psychiatry. To develop an extensive program of mental health services in the school, including preschool, day care consultation program and K-6 school projects.
Duration: November 1963-not reported.
Investigator(s): Harris B. Peck, M.D., Director, Mental Health Services, Lincoln Hospital and Associate Professor; Meyer Rabban, Ph.D.; and Melvin Roman, Ph.D., Division of Social and Community Psychiatry, Albert Einstein College of Medicine, Yeshiva University, New York 61, N. Y.

18-X-11 CHARACTERISTICS OF SOUTH HILLS CHILD GUIDANCE CENTER'S OVERALL CASELOAD

Purpose: To describe kinds of children being seen in clinic and to consider implications for patterns of service.
Subjects: Total caseload of South Hills Child Guidance Center since reorganization in September 1959.
Methods: Statistical description.
Duration: June-December 1964.
Investigator(s): Martin R. Gluck, Ph.D., Chief Psychologist, and H. Lee Wylie, M.D., Medical Director, South Hills Child Guidance Center, 300 Mt. Lebanon Blvd., Pittsburgh, Pa. 15234.
Publication: Paper to be presented at meetings of professional organizations (e.g., A.A.P.C.C.); to be submitted for publication.

18-X-12 CRISIS-FOCUSED TREATMENT IN A CHILD GUIDANCE CLINIC

Purpose: To investigate the important factors in crisis-focused treatment by categorizing: (1) the objective environmental events which precipitate family stress and subsequent referral to a clinic; (2) the subjective meaning of these events; and (3) the types of therapeutic interventions used to alleviate the stress.
Subjects: Approximately 100 families in treatment at a child guidance clinic.
Methods: A semi-structured interview of each family prior to intake interview, and a follow-up interview. Data will be analyzed to provide descriptive categories for the variables and to reveal relationships among them, such as the well-known pattern of grief reactions associated with death.
Duration: June 1963-November 1966.
Investigator(s): Mary D. Bain, M.D., Psychiatric Director, Beatrice Bloom,

M.S.S.S., ACSW, Chief, Social Service, and Karen Signell, Ph.D., Research Coordinator, Greater Lawrence Guidance Center, Inc., 217 Haverhill St., Lawrence, Mass. 01842.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Tentative plans for publication in American Journal of Orthopsychiatry.

18-X-13 RESEARCH INTO PROCESSES OF FAMILY THERAPY

Purpose: To collect empirical data on the procedure of conjoint family therapy as practiced in the Family Psychiatry Section of the Jewish General Hospital.
Subjects: 20 families selected in order of presentation for psychiatric evaluation and therapy. All families are intact with at least two parents and one child, and are seen in therapy for at least the first session conjointly.
Methods: Questionnaires are completed after initial screening, after second therapy session, after every sixth session for six months, and then after every twelfth session. Questionnaires have been structured to gather material considered pertinent from standpoint of family psychopathology on basis of clinical experience and discussions in research groups and seminars.
Duration: September 1964-1967.
Investigator(s): Nathan B. Epstein, M.D., Associate Professor, McGill University and Psychiatrist-in-Chief, Jewish General Hospital, 3755 Cote St. Catherine Rd., Montreal 26, Que.

18-X-14 FOLLOW-UP OF CHILD PSYCHIATRY DEPARTMENT CASES

Purpose: To establish a clinical facility for teaching and research purposes that will be able to follow-up all patients discharged from the Children's In-Patient Service.
Methods: Subjects to be periodically re-evaluated by a psychiatrist, psychologist, and social work team.
Duration: 1962-indefinite.
Investigator(s): Edward R. Ritvo, M.D., Ward Psychiatrist, Children's Unit, Neuropsychiatric Institute, University of California, Los Angeles 24, Calif.
Cooperating group(s): Departments of Psychology and Social Work, University of California at Los Angeles.

18-X-15 MATERNAL AND CHILD HEALTH RESEARCH PROGRAM

Purpose: To develop a research program in maternal and child health having the following objectives: (1) to study the utilization of prenatal services including the reasons or causes as to why services are not sought or are sought late in pregnancy, and the relation of this to outcome of pregnancy; (2) to evaluate adequacy of maternal and child health service programs in terms of coverage and quality of care, with promptness of attention, frequency and regularity of visits, immunization levels, referral systems and continuity of care serving as indices of such quality.
Duration: July 1964-continuing.
Investigator(s): Luis F. Sanchez Meana, M.D., M.P.H., Associate Professor, Maternal and Child Health Section, Department of Preventive Medicine and Public Health, School of Medicine, University of Puerto Rico, San Juan, P. R.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-X-16 REGIONAL MATERNAL AND CHILD HEALTH RESEARCH PROGRAM

Purpose: To establish a university-based regional maternal and child health research program, bringing together on a continuing basis a core of research personnel to produce and implement strategy of long-range, well-conceived and substantive studies. Cooperative relationships with appropriate service agencies will be developed. Primary interest will focus on impact of social and community change on health and welfare of families, especially during high risk periods such as conception, pregnancy, perinatal and early childhood. Effect of "change", including technological advances, legislative decisions, population shifts, and cultural differences, will be studied from a number of points of view: as a cause, as a result, and as a way of solving health problems of mothers and children. The geographic region involved includes New York State (especially New York City) and New Jersey, and possible eventual collaborative projects with agencies or universities in contiguous areas.
Duration: July 1964-continuing.
Investigator(s): Elinor F. Downs, M.D., M.P.H., Assistant Professor of Public Health Practice, School of Public Health and Administrative Medicine, Columbia University, New York, N. Y. 10032.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-X-17 HEALTH AND MEDICAL CARE OF MOTHERS AND CHILDREN IN AN URBAN COMMUNITY

Purpose: To provide periodic information on demographic characteristics, patterns of medical care, and health needs of families, particularly mothers and children, in the Washington Heights area of New York City. The impact of trends, movements and community changes on this known population will be examined as transition takes place.
Methods: Data gathering by personal interview from a probability sample of housewives.
Duration: July 1964-indefinite.
Investigator(s): Elinor F. Downs, M.D., M.P.H., Assistant Professor of Public Health Practice, and Jack Elinson, Ph.D., Director, Community Population Laboratory, and Associate Professor of Administrative Medicine, School of Public Health and Administrative Medicine, Columbia University, New York, N. Y. 10032.
Cooperating group(s): Children's Bureau, Welfare Administrative, U. S. Department of Health, Education, and Welfare.

18-X-18 A PLAN OF COMMUNITY RESEARCH IN MATERNAL AND CHILD HEALTH

Purpose: To undertake studies in the New England area, particularly Boston, dealing with: (1) methods of improving service programs for prevention of risks of complications and adverse outcomes of pregnancy; (2) design and evaluation of community services for prevention of risks of injuries and consequences of neglect in early childhood; (3) requirements for programs directed to health and related problems of adolescents and youth, with special emphasis on low-income, low-education level groups, and with particular focus on implications for future childbearing and child rearing. Reviews of adequacy, availability, and utilization of vital and health records for maternal and child health program studies are planned. Evaluative and experimental studies of maternity care programs are to be developed. Closely related areas of adolescents and youth and care of the young infant will be initially studied in framework of service programs, and through reporting and surveillance procedures to be established.
Duration: July 1964-continuing.
Investigator(s): William M. Schmidt, M.D., Professor and Head, Department of

Maternal and Child Health, and Robert B. Reed, Ph.D., Professor and Head, Department of Biostatistics, School of Public Health, Harvard University, 1 Shattuck St., Boston 15, Mass.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-X-19 STUDIES OF MATERNITY CARE AND PERINATAL MORTALITY IN THE SOUTHEASTERN REGION OF THE UNITED STATES

Purpose: (1) To undertake two studies focused on consumer conception, utilization, and response to maternity care in North Carolina: one of women delivering without prenatal care, the other of women applying for prenatal and delivery care under free or public programs requiring a means test; further studies of other high-risk groups will be undertaken as methodology develops. (2) To carry out methodological studies in perinatal mortality, continuing research in application of existing statistical models and developing new models for analysis and prediction of pregnancy outcome and fetal survival.
Methods: A preliminary analysis of hospital deliveries in North Carolina and some assessment of how maternity services are made available to women in the State will be made. Data will be collected by structured questionnaires administered by trained interviewers, and will be analyzed to determine relationship of study variables to utilization of maternity care and outcome of pregnancy. Emphasis will be placed on following answers: whether prenatal care itself, characteristics of woman and family, or social milieu which affects her utilization of services appear to be the most important factors in favorable or unfavorable pregnancy experience.
Duration: July 1964-continuing.
Investigator(s): Sidney S. Chipman, M.D., M.P.H., Professor and Chairman, Department of Maternal and Child Health, School of Public Health. University of North Carolina, Chapel Hill, N. C. 27515.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-X-20 WESTERN REGION MATERNAL AND CHILD HEALTH RESEARCH PROGRAM

Purpose: (1) To establish a regional research program in maternal and child health in cooperation with 12 western states in order to advance knowledge about principal factors related to high maternal, infant, and childhood mortality and morbidity in the area; (2) to determine pattern of utilization of prepaid ambulatory health and medical care services for children for a sample of families covered by Kaiser Foundation Health Plan, Oakland; (3) to study effectiveness of other community programs of prevention and medical care; and (4) to stimulate and assist the states in carrying out experiments and demonstrations of improved approaches to program planning and development based on research findings.
Methods: Demographic studies will be made to identify high risk communities, followed by detailed investigations of roles of poverty, cultural, ethnic, and geographic factors, as well as availability and use made of existing health resources, and situational and motivational barriers to utilization by high risk groups of mothers and children. Staff will initiate, in cooperation with State of Hawaii, a study of perinatal and environmental influences on physical defects and mental retardation in group of children originally followed to age two in the Kauai Pregnancy Study.
Duration: June 1964-continuing.
Investigator(s): Jessie M. Bierman, M.D., M.S.P.H., Research Physician, Fern E. French, Dr.P.H., Associate Research Biostatistician, Helen M. Wallace, M.D., M.P.H., Professor of Maternal and Child Health, School of Public Health, University of California, Berkeley; and Robert L. Nolan, M.D., M.P.H.,

Assistant Director, Department of Pediatrics, Kaiser Foundation Health Plan, Oakland, Calif.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-X-21 THE UNIVERSITY OF MICHIGAN REGION V RESEARCH PROGRAM IN MATERNAL AND CHILD HEALTH AND CRIPPLED CHILDREN'S SERVICES

Purpose: To establish and develop a long-range research program designed to contribute to improvements and innovations in health services for mothers and normal and handicapped children; eventually, to serve as a regional resource and center of research competence. Proposed research tasks include: (1) evaluation of services for handicapped children, including a general review of medical and social functioning of children with a wide variety of handicapping conditions who have received care under a State-wide crippled children's program, examination of the effectiveness of certain specialized services for handicapped children, and re-examination of "natural history" of certain chronic diseases of childhood; (2) investigations in pediatric outpatient services; (3) problems of institutionalization and institutional care for children; and (4) financing children's health services.
Duration: July 1964-continuing.
Investigator(s): Donald C. Smith, M.D., Professor, and Harold A. Decker, M.D., Assistant Professor, Department of Maternal and Child Health, School of Public Health, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-X-22 A PROGRAM TO INVESTIGATE REPRODUCTIVE WASTAGE (INCLUDING RELATED FORMS OF MENTAL RETARDATION AND NEUROLOGIC DAMAGE) IN A VERY HIGH RISK URBAN INDIGENT POPULATION

Purpose: To build a research program designed to investigate all forms of reproductive wastage in a very high risk urban indigent population in order that reproductive care programs may be redesigned to prevent this high incidence of reproductive wastage.
Methods: Program will begin with clinico-pathologic correlations in abortion, fetal and neonatal death and expand to include nonfatal sequelae of perinatal stress. Patients with a history of previous reproductive wastage will be selected and prospectively studied to learn techniques of applying reproductive research skills to improve patient care. Additional areas of development include sociologic definition of high risk population, application of genetic counseling to reproductive care, continuous audit of congenital malformation occurrence, natural history of reproduction in the mentally retarded mother, and maternal mortality in abortion among the indigent.
Duration: July 1964-continuing.
Investigator(s): Malcolm G. Freeman, M.D., and staff, Department of Gynecology-Obstetrics, School of Medicine, Emory University, Atlanta, Ga. 30303.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-X-23 A STUDY TO DESCRIBE THE CHARACTERISTICS OF DEATHS ASSOCIATED WITH CHILDBIRTH IN METROPOLITAN NEW ORLEANS AND SUBSEQUENTLY IN THE STATE OF LOUISIANA

Purpose: To undertake an epidemiologic review of stillbirths and of infant and maternal deaths; to identify regions of high prevalence of fetal and infant wastage and to describe the geographic, demographic, and temporal details of

the loss. To identify an area of high annual perinatal mortality in New Orleans and conduct a prospective study of subsequent pregnancies of the mothers. To identify localities having highest rates of stillbirth and infant mortality in State of Louisiana and undertake an epidemiologic and sociologic review of these areas to determine what factors may be responsible for these occurrences.
Methods: Examination of vital records of the State of Louisiana and the parish of Orleans, including medical records, records in health and welfare departments, and in other official and voluntary agencies. Collaboration with Boards of Health of New Orleans and State of Louisiana in program planning for areas of highest rates of stillbirths and infant mortality. Evaluation of effectiveness of these programs at specified intervals.
Duration: July 1964-continuing.
Investigator(s): Robert H. Lennox, M.D., Professor of Child Health, Division of Hygiene and Tropical Medicine, School of Medicine, Tulane University, New Orleans, La. 70112.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-X-24 SUDDEN UNEXPLAINED DEATH IN INFANTS SYNDROME

Purpose: To establish the epidemiologic background for sudden unexplained death in the State of Washington antecedent to further analysis.
Subjects: Dead infants.
Methods: At present, careful postmortem exams and clinical summaries are being accumulated. Frozen serum and tissues are stored for subsequent analysis. After sufficient experience and accumulation of background information, an investigation into the mechanism of death will be done.
Duration: July 1963-indefinite.
Investigator(s): N. Karle Mottet, M.D., Director of Hospital Pathology and Associate Professor of Pathology, University Hospital, University of Washington, Seattle, Wash.
Cooperating group(s): Washington State Medical Association.

18-X-25 ASSESSMENT OF THE HEALTH STATUS OF MOTHERS AND CHILDREN AND THE AVAILABILITY AND UTILIZATION OF HEALTH FACILITIES IN A SELECTED SAMPLE OF HIGH-RISK COMMUNITIES

Purpose: To provide nationwide comparative data on both urban and rural areas of high risk for maternal and child health and welfare.
Subjects: Mothers and children.
Methods: Analysis of census data and special tabulations; selection of a sub-set of rural and urban high-risk areas for field survey and intensive study; examination of local data as to availability and utilization of services pertinent to maternal and child health.
Duration: June 1964-May 1967.
Investigator(s): Robert B. Reed, Ph.D., Chairman, Department of Biostatistics, and Lenin A. Baler, Ph.D., S.D. Hyg., Assistant Professor of Psychology, Harvard School of Public Health, Boston 15, Mass.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-X-26 MEDICAL CARE OF INFANTS AND PRESCHOOL CHILDREN

Purpose: (1) To determine amount and kind of medical care now actually being received by infants and preschool children; (2) to describe the barriers to

fuller use of facilities that are at present available; and (3) to provide a rational basis for suggesting changes in the structure and organization for providing their medical care.
Subjects: Mothers of infants and preschool children.
Methods: Repeated interviews with mothers of a cohort of newborn infants and mothers of a randomly selected sample of preschool children. Interviews will be conducted monthly for one year for infants, and bimonthly for one year for preschool children. Appropriate control groups will be interviewed once only at intervals during the year to assess effect of repeated interviewing.
Duration: January 1964-1968.
Investigator(s): Rowland L. Mindlin, M.D., Acting Director, Bureau of Child Health, and Paul M. Densen, Sc.D., Deputy Commissioner, New York City Department of Health, New York, N. Y.
Cooperating group(s): Albert Einstein College of Medicine.
Publication: A series of articles is anticipated.

18-X-27 A STUDY OF FACTORS INFLUENCING THE HEALTH CARE OF INFANTS BORN TO RESIDENTS OF A NORTH CAROLINA COUNTY

Purpose: To learn how, why, and where families of young infants in a specific area of the South do or do not obtain health care for their infants during the first 14 months of life.
Subjects: A cohort sample of infants born to Orange County residents, selected monthly from the birth registrations over a period of one year and followed until approximately 14 months of age.
Methods: By using highly structured questionnaires and trained interviewers, information is obtained from mothers of these infants at specified intervals. Questions are designed to obtain information on family characteristics and family's level of health awareness, their satisfaction or dissatisfaction with health care, and availability to them of health resources. Health records of the infants will be checked at the end of the family data collection.
Duration: July 1963-July 1966.
Investigator(s): Ann DeHuff Peters, M.D., Associate Professor of Maternal and Child Health, and Sidney S. Chipman, M.D., Professor and Chairman, Department of Maternal and Child Health, School of Public Health, University of North Carolina, Chapel Hill, N. C.
Cooperating group(s): North Carolina State Board of Health.

18-X-28 DETERRENTS TO CHILD HEALTH SUPERVISION

Purpose: To determine whether family circumstances or other factors play a role in influencing scheduled attendance at a pediatric comprehensive health clinic.
Subjects: Infants born at North Carolina Memorial Hospital, qualifying for comprehensive health care in the pediatric clinics and given appointments for such follow-up care.
Methods: Infants were studied by chart review to obtain a record of first nine-months of attendance in clinic. Mothers of these infants (N=246) were visited at home and were interviewed when infant was approximately ten months of age; a structured questionnaire designed to give information about family's awareness of health resources, child health knowledge, attitudes toward health personnel, social alienation, and other factors which might influence their attendance at clinic was employed.
Duration: January 1963-September 1964.
Investigator(s): Naomi M. Morris, M.D., M.P.H., Assistant Professor; Martha H. Hatch, B.S., Research Associate; and Sidney S. Chipman, M.D., M.P.H., Professor and Chairman, Department of Maternal and Child Health, School of Public Health, University of North Carolina, Chapel Hill, N. C.

Cooperating group(s): North Carolina Memorial Hospital, University of North Carolina.
Publication: Paper presented at Maternal and Child Health Session at Annual Meeting of the American Public Health Association, New York City, October 1964.

18-X-29 SOCIAL FACTORS AND PARTICIPATION IN FOLLOW-UP CARE OF CHOREA

Purpose: To describe a group of chorea patients; to evaluate their participation in a program of follow-up care; to determine whether certain medical and social factors are associated with cooperation in follow-up care.
Subjects: 132 patients at La Rabida Jackson Park Sanitarium, with a diagnosis of encephalitis rheumaticum, who were placed in Home Service (follow-up) program from its inception in 1950 until December 1959.
Methods: Analysis of medical and social service records. Cases were assigned to criterion groups on basis of quality of cooperation.
Findings: Thus far, all but 19 continued to return for follow-up care over four years or more; of these, 11 withdrew for "acceptable" reasons such as moving from state. Of those who continued 96 percent made 10 or more return visits. Various social factors show associations with quality of participation.
Duration: October 1963-indefinite.
Investigator(s): Mary E. Macdonald, Ph.D., Professor, School of Social Service Administration, University of Chicago, Burton J. Grossman, M.D., Medical Director, and Katherine L. Hagberg, A.M., Director of Social Service, La Rabida Jackson Park Sanitarium, 65th St. and South Shore Dr., Chicago 49, Ill.
Publication: Two or more papers are planned.

18-X-30 HOSPITAL INPATIENT UTILIZATION BY AGE, SEX, DIAGNOSIS, AND TYPE OF BLUE CROSS AGREEMENT

Purpose: To determine type and extent of overall hospital (inpatient) utilization and differences in hospital utilization for various membership groups (agreements); to establish basis for similar comparative studies.
Subjects: Blue Cross of Western Pennsylvania enrollees for 1963 who were under 18 years of age.
Methods: Analysis of hospital claim forms submitted from approximately 100 member hospitals.
Duration: June-December 1964.
Investigator(s): Bernard Ferber, M.S., Assistant Director for Research, Blue Cross of Western Pennsylvania, One Smithfield St., Pittsburgh, Pa. 15222.
Publication: To be submitted to Blue Cross Association, Chicago, Ill.

18-X-31 DAY TREATMENT PROGRAM FOR HOSPITALIZED YOUNG PATIENTS

Purpose: To test effectiveness of a program which provides the maximum service possible for hospitalized children and adolescents within the present resources at St. Elizabeths Hospital.
Subjects: Inpatients at St. Elizabeths Hospital.
Methods: Comparison of patients who are participants in Day Treatment Program with matched cases who are not.
Duration: June 1964-June 1967.
Investigator(s): Dale C. Cameron, M.D., Superintendent, and Goldie Cohen, M.A., Coordinator, Youth Program, St. Elizabeths Hospital, U. S. Department of Health, Education, and Welfare, Washington, D. C. 20032.
Publication: Results will be available from St. Elizabeths Hospital upon completion of the study.

18-X-32 UTILIZATION OF PROFESSIONAL PERSONNEL IN NEW YORK CITY SCHOOL HEALTH SERVICE

Purpose: To develop a school health team that will employ an optimum percentage of professional time for professional purposes; to develop methodology for studying public health personnel utilization patterns.
Subjects: Activities of Health Department doctors, nurses and public health assistants in the school health program will be studied.
Methods: Study will be conducted in three phases: phase I will be a utilization study of present system. A work diary method will be employed to arrive at baseline data. Phase II will be an analysis of baseline data and experimentation with restructured staffing patterns. Phase III will be an appraisal of the restructured patterns.
Duration: April 1964-November 1966.
Investigator(s): Lester J. Rosner, M.A., Assistant Commissioner for Administrative Services; Robert W. Culbert, M.D., Director, Bureau of School Health Services; and Grace McFadden, M.A., M.P.H., Director of Public Health Nursing, New York City Department of Health, New York 13, N. Y.
Cooperating group(s): New York City Board of Education.
Publication: Report will be available from New York City Health Department.

18-X-33 JOINT STUDY ON PEDIATRIC RESEARCH, EDUCATION, AND PRACTICE

Purpose: To gather information on various aspects of pediatric practice and health services to children; to study relation of pediatric teaching and research to changing problems of child health.
Methods: Questionnaire surveys of pediatricians and chairmen of pediatric departments; compilation of information available from other health organizations and surveys.
Duration: May 1962-June 1965.
Investigator(s): Robert E. Cooke, M.D., Chairman, Department of Pediatrics, School of Medicine, Johns Hopkins University, Baltimore 5, Md.; Donald A. Cornely, M.D., Associate Research Professor of Maternal and Child Health, School of Public Health, University of Pittsburgh, Pittsburgh, Pa; and E. H. Christopherson, M.D., Executive Director, American Academy of Pediatrics, 1801 Hinman Ave., Evanston, Ill. 60204 (Reported by Robert G. Frazier, M.D., Secretary, American Academy of Pediatrics.)
Cooperating group(s): American Pediatric Society; American Board of Pediatrics; Section of Pediatrics, American Medical Association; Society for Pediatric Research.

18-X-34 BRIDGING GAPS IN DOCTOR-PATIENT COMMUNICATION

Purpose: To determine some gaps in communication between physician and patient or parent; to develop methods for bridging these gaps.
Subjects: Parents of patients visiting various outpatient departments and well-baby clinics.
Methods: Using brief interview schedules to explore patients' expectations from physician and clinic, and their ideas about the illness and treatment, etc.
Findings: Preliminary findings would suggest that if patients' expectations and patients' own ideas concerning illness and treatment are taken into account, more effective communication between physician and parents will take place, and medical advice will be more likely to be followed.
Duration: October 1964-October 1967.
Investigator(s): Barbara Korsch, M.D., Associate Professor of Pediatrics, School of Medicine, University of Southern California, Los Angeles 7, Calif.
Cooperating group(s): Children's Hospital of Los Angeles; Cedars of Lebanon Hospital; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-X-35 APPLICATION OF CEPHALOMETRIC ROENTGENOGRAPHY TO PEDODONTICS RESEARCH

Purpose: To develop a program of cephalometric roentgenography for the evaluation of therapeutic and preventive measures now employed in pedodontics and supportive to training of pedodontists; to evaluate and measure the effects of static and corrective orthodontic technics now employed in Children's Dentistry.
Subjects: Normal patient load available in Department of Pedodontics at College of Dentistry, constituting children, ages 3 to 15, actively being seen for dental care.
Methods: In addition to routine dental examination and records, oriental lateral cephalometric films, frontal cephalometric films, and oriented oblique cephalometric films are obtained. Dental casts are also obtained at regular intervals. Cephalometric analysis will be made on each child using standard tracing and measuring techniques as well as other analysis specifically developed for these demonstrations. Related measurements of dentition will be made from dental casts.
Duration: September 1959-continuing.
Investigator(s): Thomas K. Barber, D.D.S., M.S., Professor of Dentistry, and Samuel Pruzansky, D.D.S., M.S., Professor of Pedodontics, College of Dentistry, University of Illinois, Chicago, Ill.
Cooperating group(s): National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be published as each subject studied is completed. A few papers relative to comparative studies in tooth eruption and effects of anterior crossbite have been published.

18-X-36 DENTAL THROAT CULTURE STUDY

Purpose: To include the dentist in a more active role in the primary prevention of rheumatic fever and its sequelae; to postpone oral surgery when culture is positive until a 10-day treatment period is completed; and to show that this can be a simple procedure adaptable to dental practice.
Subjects: Children, 5 to 15 years of age.
Methods: (1) Use of Stickney Township Dental Clinics; and (2) use of questionnaire to determine whether child needs a throat culture.
Findings: Thus far, approximately 25 percent of children on whom throat cultures were taken were positive for Group A streptococci.
Duration: April 1964-April 1967.
Investigator(s): Gene J. Franchi, D.D.S., M.P.H., Dental Director and Acting Health Officer, and staff, Stickney Public Health District, Oaklawn, Ill.
Cooperating group(s): Illinois State Department of Public Health; National Heart Institute, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: First year results to be available in 1965.

18-X-37 MEDICAL DEPENDENCY AND DENTAL CONDITION

Purpose: Findings from an earlier phase of this dental research program suggest that, over and above economic status, some families receive health care primarily through organized community programs (Bulletin 12, Research Relating to Children). Present study will determine whether the dental condition of teenagers is associated with an earlier pattern of receiving free care in a public health dental clinic by the teenagers themselves or by their younger siblings.
Subjects: A cohort of 850 lower income families in which there is a teenage child.
Methods: Dental examinations, including bitewing X-rays, have been conducted

on the teenagers, and various ratings of dental condition have been constructed. Information has been collected in structured interviews with mothers on general style of life variables, with particular emphasis on respondents' roles in initiating and maintaining family pattern of health care.
Duration: January 1963-December 1965.
Investigator(s): Camille Lambert, Jr., Ph.D., Assistant Professor of Social Research, Howard E. Freeman, Ph.D., Associate Professor, and Robert Morris, D.S.W., Professor, Florence Heller School for Advanced Studies in Social Welfare, Brandeis University, Waltham 54; Leon J. Taubenhaus, M.D., M.P.H., Assistant Director, Boston City Hospital, Boston; and Edward C. Maloof, D.D.S., M.P.H., Director, Brookline Dental Clinic, Brookline, Mass.
Cooperating group(s): Brookline Department of Health; Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Several papers to be developed for submission to professional journals upon completion of project.

18-X-38 OPTIMUM PRENATAL-POSTNATAL FLOURIDE FOR DEVELOPMENT OF DECIDUOUS AND PERMANENT TEETH

Purpose: To determine from clinical examination optimum prenatal-postnatal flouride for development of caries-resistant deciduous and permanent teeth.
Subjects: 300 children from kindergarten and grades 1 and 2--lifelong residents of communities with 0.0, 1.0, or 4.0 p.p.m. flouride in the water.
Methods: Dental examinations.
Duration: April 1963-indefinite.
Investigator(s): Charles W. Gish, D.D.S., M.S.D., Director, Division of Dental Health, Indiana State Board of Health, Indianapolis, Ind.
Publication: To be submitted for publication in 1964.

18-X-39 THE EFFECT OF SCHOOL WATER FLUORIDATION ON DENTAL CARIES IN PIKE COUNTY, KENTUCKY AND ELK LAKE, PENNSYLVANIA

Purpose: To determine the reductions in dental caries activity which can be attained by the addition of fluorides to water consumed by children while attending school in an area where communal water supplies are fluoride-deficient.
Subjects: Students attending the Elk Lake School in Dimock, Pa. and the Feds Creek and Phelps Schools in Pike County, Ky.; all these schools contain grades 1 through 12.
Methods: At Elk Lake School, fluoride level of school's water supply has been maintained at five parts per million since 1958. Fluoride levels at the two schools in Kentucky have been adjusted to 3 ppm since 1957. All children in these schools were examined prior to initiating fluoridation. Periodically, children are re-examined and findings compared with baseline data to determine interim results.
Duration: Kentucky: 1957-1968; Pennsylvania: 1958-1969.
Investigator(s): Herschel S. Horowitz, D.D.S., M.P.H., Chief, Research and Development Section, and Frank E. Law, D.D.S., M.P.H., Former Chief (retired), Disease Control Branch, Division of Dental Public Health and Resources, Public Health Service, U. S. Department of Health, Education, and Welfare, 8120 Woodmont Ave., Bethesda, Md.
Cooperating group(s): Kentucky State Department of Health; Pennsylvania State Department of Health; Division of Dental Public Health and Resources, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Results obtained after five years' investigation in Kentucky and four years in Pennsylvania are currently being prepared for an interim report.

18-X-40 A STUDY OF THE PRENATAL EFFECTS OF CONTROLLED FLUORIDATION ON DECIDUOUS TEETH

Purpose: To determine the benefits, if any, to the deciduous teeth of seven year old children who have ingested optimally fluoridated water during the period of embryonic growth and development.
Subjects: Approximately 3000 school children in Minneapolis, Minnesota, enrolled in grades 1 and 2, who have the proper lengths of prenatal exposure to fluoridated water.
Methods: A series of five dental examinations will be conducted at three month intervals on children aged seven years two months through seven years four months at the time of examination. Group A children have had no prenatal exposure; Group B children were exposed to fluoridated water up to the last three months of the prenatal period; Group C children were exposed to fluoridated water more than the last three months but less than the last six months of the prenatal period; Group D children were exposed to fluoridated water more than the last six months but less than the nine months of the prenatal period; Group E children were exposed to fluoridated water during the full term of pregnancy.
Duration: September 1964-September 1965.
Investigator(s): Herschel S. Horowitz, D.D.S., M.P.H., Chief, and Stanley B. Heifetz, D.D.S., M.P.H., Research and Development Section, Disease Control Branch, Division of Dental Public Health and Resources, Public Health Service, U. S. Department of Health, Education, and Welfare, 8120 Woodmont Ave., Bethesda, Md.
Cooperating group(s): Minneapolis Board of Education; Minnesota State Department of Health.
Publication: Paper will be submitted for publication in appropriate professional journal and may be presented at a national dental meeting.

18-X-41 EVALUATION OF A TOPICAL APPLICATION OF STANNOUS FLUORIDE TO TEETH OF CHILDREN RESIDING IN A FLUORIDATED COMMUNITY

Purpose: To determine if a significant additive effect in caries-inhibition results from augmenting water fluoridation with topical application of stannous fluoride.
Subjects: A sample of 1266 Chattanooga, Tennessee school children in grades 2 through 4 who have had maximum exposure to fluoridated water.
Methods: Children divided into three comparable study groups: Group A receives annually a prophylaxis; Group B receives annually a prophylaxis followed by a four-minute topical application of an eight percent stannous fluoride solution; Group C receives annually a prophylaxis followed by a thirty-second topical application of a ten percent stannous fluoride solution. Clinical dental examinations annually; dental caries increment for each group tabulated and evaluated statistically.
Duration: December 1963-December 1965.
Investigator(s): Herschel S. Horowitz, D.D.S., M.P.H., Chief, and Stanley B. Heifetz, D.D.S., M.P.H., Research and Development Section, Disease Control Branch, Division of Dental Public Health and Resources, Public Health Service, U. S. Department of Health, Education, and Welfare, 8120 Woodmont Ave., Bethesda, Md.
Cooperating group(s): Tennessee State Department of Public Health.
Publication: Paper will be submitted for publication in appropriate professional journal and may be presented at a national dental meeting.

18-X-42 EVALUATION OF A STANNOUS FLUORIDE PROPHYLAXIS PASTE FOR USE IN DENTAL PUBLIC HEALTH PROGRAMS

Purpose: To determine the efficacy of a stannous fluoride prophylaxis paste

BEST COPY AVAILABLE 474

in controlling dental caries when the paste is employed: (1) as an independent agent; and (2) when followed by a single topical application of an eight percent stannous fluoride solution.
Subjects: A sample of 1157 school children in Asheville, North Carolina enrolled in grades 3 through 5.
Methods: Children divided into four comparable study groups. Group A annually receives a regular prophylaxis; Group B annually receives a prophylaxis using a stannous fluoride prophylaxis paste; Group C annually receives a regular prophylaxis followed by a topical application of an eight percent stannous fluoride solution; Group D receives a prophylaxis using a stannous fluoride paste, followed by a topical application of an eight percent fluoride solution. Clinical dental examinations conducted annually. Dental caries increment for each group tabulated and evaluated statistically.
Duration: February 1963-February 1965.
Investigator(s): Herschel S. Horowitz, D.D.S., M.P.H., Chief, Research and Development Section, Disease Control Branch, Division of Dental Public Health and Resources, Public Health Service, U. S. Department of Health, Education, and Welfare, 8120 Woodmont Ave., Bethesda, Md.
Cooperating group(s): North Carolina State Board of Health.
Publication: Paper will be submitted for publication in appropriate professional journal and may be presented at a national dental meeting.

18-X-43 STUDY TO DETECT ANTI-CARIOGENIC EFFECT OF A STANNOUS FLUORIDE PROPHYLACTIC PASTE

Purpose: To determine if cleaning the teeth professionally with a prophylactic paste containing stannous fluoride is effective in reducing incidence of dental caries and, if so, how effective.
Subjects: Approximately 975 white school children, 7 to 13 years of age.
Methods: Dental examinations (DMFT and DMFS); selection of three equal groups according to age, sex and dental caries experience, and treatments as follows: (1) to receive a dental cleansing by a dental hygienist using a fluoride prophylactic paste; (2) to receive a dental cleansing by a dental hygienist using a prophylactic paste without fluoride; and (3) to receive no dental cleaning (examinations only). Examinations and treatments will be repeated at the end of one year and final examinations will be made two years after initial treatments.
Duration: September 1963-December 1965.
Investigator(s): John E. Chrietzberg, D.D.S., M.P.H., Director, Branch of Dental Health, and James F. Lewis, D.D.S., Acting Director, Dental Public Health Service, Georgia Department of Public Health, 47 Trinity Ave., S.W., Atlanta, Ga.

SOCIAL SERVICES

18-Y-1 ADOPTION OF AMERICAN INDIAN CHILDREN BY CAUCASIAN FAMILIES

Purpose: To follow a sample of families who adopted American Indian children through the Indian Adoption Project, a joint undertaking of the Child Welfare League of America and the U. S. Bureau of Indian Affairs, in order to evaluate the outcome of placements, thus providing information to the child welfare field relevant to the issue of promoting adoption of children across racial lines.
Methods: Annual research interviews with adoptive parents will be conducted for a five-year period to determine their degree of satisfaction with overall experience with these children. Measures of personal and social adjustment of the child will be developed, using reports of parents as well as independent reports secured from teachers in the schools children attend.
Duration: January 1964-1969.
Investigator(s): David Fanshel, D.S.W., Associate Professor, School of Social Work, Columbia University, New York, N. Y.
Cooperating group(s): Child Welfare League of America, Inc.; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-2 FACTORS ASSOCIATED WITH VARYING LEVELS OF ADJUSTMENT OF ADOPTED CHILDREN

Purpose: To identify factors associated with "good" versus "poor" adoptive placements with special attention to those factors known to agency or which could have been known to agency at time of placement.
Subjects: A random sample of 180 children, 7 through 10 years old, who were placed in adoption in infancy (less than 18 months of age) in homes in which there were no other children at time of placement.
Methods: Intensive analysis of initial adoptive study from case records, and information on current situation obtained through follow-up visits by professional caseworkers. Each adoptive parent will be separately interviewed, and child will be observed briefly during a home visit.
Duration: December 1963-July 1967.
Investigator(s): Lilian Ripple, Ph.D., Professor and Director, Research Center, School of Social Service Administration, University of Chicago, Chicago, Ill.
Cooperating group(s): Illinois Children's Home and Aid Society; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Publication is planned.

18-Y-3 FOLLOW-UP ADOPTION STUDY OF CHILDREN LEGALLY ADOPTED THROUGH THE CHILDREN'S AID SOCIETY, 1950-1957

Purpose: To study characteristic adjustment patterns of adoptive families at point of follow-up; to identify some factors responsible for differentiating most successful from least successful placements; in children's phase, to evaluate child's sense of identity, nature of child-parent relations in adoption, adopted child's concept of birth origin, and general level of adjustment.
Subjects: Sample of 200 families; 100 children, now ranging in age from 7 to over 15 years, selected from these families.

Methods: Questionnaire, data from records, and taped interviews.
Duration: 1960-1966.
Investigator(s): Elizabeth A. Lawder, D.S.W., Executive Director, Children's Aid Society of Pennsylvania, 311 S. Juniper St., Philadelphia, Pa. 19107.
Cooperating group(s): Graduate Department of Social Work and Social Research, Bryn Mawr College; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-4 DAY CARE -- THE UTAH STUDY

Purpose: To study need for day care services in Utah for preschool and school age children in the five Wasatch Front counties comprising approximately 75 percent of the State population: Box Elder, Weber, Davis, Salt Lake, and Utah.
Methods: Four independent studies used to collect data. (1) In a survey of mothers, 4,669 family units were randomly selected and screened to determine whether mothers worked at least five hours per week and whether children under age 17 were present. Of 1,112 mothers selected, 1,031 were interviewed using a 101-item schedule. An item analysis technique using 11 criteria as indicators of need yielded means and standard deviations for each item and provided frequencies, percentages, biserial correlations, and standard errors for each alternative. (2) Questionnaires were sent to 12 community service agencies; 10 replies were received and analyzed. (3) Questionnaires were sent to 68 day care centers. (4) Feasibility of day care centers based upon geographic area-population density data was computed. Finally, the four studies were compared.
Findings: All studies strongly suggest need for additional day care services. Survey of mothers suggests a particular need for services for preschool children, including infants. Mothers feel strongly about need for evening services and prefer group care centers and visiting homemaker services to family care. Agencies envision strong need for youth or after school centers; day care centers see a need for services for infants, hourly drop-ins, and the handicapped.
Duration: July 1963-June 1964.
Investigator(s): Frank Q. Sessions, Ph.D., Instructor in Sociology, University of Utah, and Eva V. Hancock, M.A., M.S.W., Executive Director, Community Services Council, Salt Lake City, Utah.
Cooperating group(s): Utah State Department of Public Welfare; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Report available from Community Services Council and Utah State Department of Public Welfare.

18-Y-5 BUCKHORN DAY CARE PROJECT

Purpose: To evaluate and demonstrate in a qualitative and quantitative manner what can be accomplished in the current and future provisions of an enriched day care program, supplemented by casework services to families of children receiving day care, in raising the level of their psychosocial, cultural, and intellectual performance.
Methods: Children will be followed as they move from day care program into public schools, and comparison will be made between these children and children from similar home situations who have not participated in day care program to determine what differences, if any, can be perceived in responsiveness to new learning challenges, ability to cope with tasks demanding sustained effort, relationship to peers and teachers, etc.
Duration: 1964-1968.
Investigator(s): Rita McMahon, M.A., Supervisor of Licensing, Kentucky Department of Child Welfare, Frankfort, and Frank Kodman, Ph.D., Associate Professor of Psychology, University of Kentucky, Lexington, Ky.

Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-6 THE DAY CARE EXCHANGE

Purpose: To subject an existing process, the private placement of children by their parents in an unrelated home for the purpose of receiving day care service, to an orderly investigation and evaluation to determine if this process can be effectively organized into a new type of day care resource.
Methods: Initially, existing private care in one area of Portland will be investigated. The new service arrangement will consist of a core of social work staff whose function will be to assist working parents in finding private families to care for their children. At the same time the private family will be involved in a voluntary educational-supervisory program to ensure the provision of adequate care.
Duration: 1963-1966.
Investigator(s): Gerald A. Frey, ACSW, Program Director, Friendly House, Inc., 2617 N.W. Savier, Portland 10, Oreg.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-7 UTILIZING DAY CARE SERVICES AS AN INTEGRAL PART OF THE AFDC PROGRAM

Purpose: To determine whether day care services are a significant and useful service, warranting their incorporation as an integral part of the Public Assistance Program; to restore AFDC families, using an experimental approach, to greater levels of self-sufficiency by means of day care services.
Subjects: 3 groups of 100 families.
Methods: Services of the Rhode Island Public Assistance and Child Welfare Services and both units of the Rhode Island Department of Social Welfare will be converged upon the selected families as a means of opening opportunity and stimulating positive, voluntary change. The first group of subjects will receive day care services and intensive social work services by professionally trained staff; the second group will receive professional social work services, but cannot be provided with day care; the third group will receive regular public agency services, but will receive neither day care nor professional social work services. Focal point of evaluation will be an assessment of differential outcomes of the three groups at conclusion of two-year project period.
Duration: July 1964-1966.
Investigator(s): John J. Affleck, ACSW, Assistant Director, Division of Community Services, Rhode Island State Department of Social Welfare, Providence, R. I.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-8 DAY CARE TREATMENT OF EMOTIONALLY DISTURBED CHILDREN

Purpose: To develop an interdisciplinary day care program with service, training, and research functions. The design of the program is to integrate treatment of parents with special education and psychotherapy for children. The day care setting with child remaining in his home will be used for study of family relationships with particular emphasis on interpersonal meaning of child's symptoms in the family and school.
Subjects: 24 emotionally disturbed children at Children's Psychiatric Hospital who are not educable in the regular school system, but not sufficiently dis-

turbed to justify hospitalization, and their parents. Availability of parents for family treatment will be a criterion for admission to the program.
Methods: Children will receive small group and individual remedial instruction, occupational therapy, recreational therapy, individual psychotherapy, and chemotherapy when indicated. Families will be divided into two groups. In the first, parents will be seen in parallel group psychotherapy in which the school principal will participate as an observer and will also deal directly with the parents in this group for administrative matters connected with school. The second group of parents will be seen in casework and will relate to school through the social worker. The relative effectiveness of the two treatment designs will be compared.
Duration: 1962-not reported.
Investigator(s): Jack C. Westman, M.D., Assistant Professor of Psychiatry, Daniel R. Miller, Ph.D., Professor of Psychology, Frank Wilderson, Ph.D., School Principal, William A. Bell, M.S.W., Staff Social Worker, and Eric Berman, Ph.D., Research Psychologist, Medical Center, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-Y-9 A DIVISION OF CASEWORK RESPONSIBILITY AS A METHOD OF WORKING WITH DISTURBED CHILDREN IN FOSTER CARE

Purpose: To demonstrate a new method, the division of casework responsibility into two parts (parental force and therapy), as a way of working with disturbed children in foster care, using the casework resources within the agency.
Subjects: A sample of 24 children between ages 7 and 16 who will be placed in foster care by Iowa Children's Home Society between December 1, 1963 and December 1, 1964, and who will remain under care of agency for at least two years. All are emotionally disturbed.
Methods: Cases will be assigned at random to one of two methods to be used. In first group, one worker will do all casework with child; in second, one caseworker will act as parental force worker and another caseworker will do casework therapy. Each case will be staffed every ten weeks with consulting psychiatrist and all crucial people. At time of intake, a battery of psychological tests will be given. Within first two months in care a series of tests will be administered including interviews with child, foster mother, school peers, teachers, and caseworker. Same tests will be given two years later for evaluative purposes.
Duration: December 1963-June 1966.
Investigator(s): Edith Zober, M.S.S.W., Research Director, Iowa Children's Home Society, 1101 Walnut St.; Milford P. Barnes, M.D., Medical Director, Des Moines Child Guidance Center, 1206 Pleasant St., Des Moines, Iowa, and Merlin Taber, Ph.D., Associate Professor, School of Social Work, University of Illinois, Urbana, Ill.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: A book is planned, directed to an audience of caseworkers working with children; tentative title: Parental Force.

18-Y-10 A VOCATIONAL DEVELOPMENT PROGRAM FOR EMOTIONALLY DISTURBED ADOLESCENTS IN RESIDENTIAL TREATMENT, GROUP HOME, AND FOSTER HOME PLACEMENT

Purpose: (1) To test hypothesis that initiating vocational habilitation services for emotionally disturbed adolescents in placement at age 14 will be more effective in promoting eventual vocational adjustment than will be initiating such services at more traditional age of 17; (2) to study the vocational development of such adolescents.

Subjects: Approximately 60 children receiving services from 4 agencies providing residential services to emotionally disturbed children.
Methods: Series of vocational services for 30 14-year old children focused on use of a rehabilitation workshop. Services are integrated into treatment programs of child care agencies. Vocational services will continue for approximately 4 years for each child. A group of older children will receive shorter-term services. Vocational outcomes in year following completion of individual programs will be compared for the two groups. Annual measures are being secured in order to study vocational development.
Duration: July 1963-October 1968.
Investigator(s): William Gellman, Ph.D., Executive Director, and Gisela Mendel, Ph.D., Research Associate, Jewish Vocational Service of Chicago, 1 S. Franklin St., Chicago 6, Ill.
Cooperating group(s): Jewish Federation of Metropolitan Chicago; Jewish Children's Bureau of Chicago; Illinois Children's Home and Aid Society; Illinois Lutheran Welfare Association; Mary Bartelme Home for Girls of Metropolitan Chicago; Vocational Rehabilitation Administration; and Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: To be reported in journal articles, progress reports, and a final report.

18-Y-11 DEVELOPMENT OF GROUP FOSTER HOMES FOR CHILDREN IN LONG-TERM CARE

Purpose: To demonstrate the feasibility of developing more stable family homes in an urban setting for children of minority groups, coming into custody of a public welfare department for long-term care.
Methods: Children in compatible groups of family size will be assembled and placed with foster parents employed by Family and Child Services, the homes to be supplied by the agency. Six such homes will be established with sufficient variation in their composition to test response to such facilities by children of different ages. Securities of employment provision of full supporting social services to children and foster parents are relied upon to ensure continued care.
Duration: April 1963-1967.
Investigator(s): Catherine Pratt, Project Director, Family and Child Services of Washington, D. C., 929 L St., N. W., Washington, D. C.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-12 THE EXTENT AND ADEQUACY OF THE EXISTING PHYSICAL PLANT, UNDER SOCIAL WORK AUSPICES, FOR THE GROUP CARE OF CHILDREN

Purpose: As beginning phase of ongoing research, study seeks to determine the extent and adequacy of the existing physical plant, and thus provide a gauge whereby society can relate current program needs and requirements to available capacity and condition of physical child care facilities. These factors, in combination with other critical considerations (not within scope of this study, i.e., availability of professional staff, organizational structure, etc.) would furnish ingredients necessary for preparation of feasible and achievable comprehensive child care program. Study will be limited to public and voluntary institutions under social work auspices for group care of children and will be based on a representative selection of public and voluntary institutions geographically distributed by program throughout the nation. All detailed information will be tabulated by public and voluntary character of institution, by state and region, and by type of group care facility.
Duration: June 1964-1966.
Investigator(s): Jack Meltzer, M.A., Director, Center for Urban Studies,

University of Chicago, Chicago, Ill.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-13 SUBSTITUTE CARE STUDY

Purpose: To determine need for substitute care for children who cannot remain in own homes; to plan means for providing care and/or means for preventing necessity for leaving home.
Duration: May 1964-not reported.
Investigator(s): Margaret A. Barrett, M.S.S.W., Assistant Executive Director, and staff, Richmond Area Community Council, 2501 Monument Ave., Richmond, Va. 23220. (Reported by Charles W. Fleming, Executive Director, Richmond Area Community Council.)
Cooperating group(s): Catholic Family and Children's Service; Jewish Family Service; Children's Home Society; Friends Association for Children; Henrico and Chesterfield Welfare Departments; Family and Children's Service, Richmond Welfare Department.

18-Y-14 CHILD WELFARE RESEARCH PROGRAM

Purpose: To develop a basic perspective for a five to seven year program of child welfare research in New York City, focusing mainly upon problems of group care for children, the institutionalization of services to children, and the task of developing innovations in services for long-term care of minority group children and children of poverty-stricken families. First year will be utilized for developing a "hard fact" study, looking at various patterns of care for children in New York City, particularly the "left out" child and sizing up problem's basic dimensions. Columbia University School of Social Work will be examining, with public and voluntary agencies, specific roles they might play within School's overall effort. Of particular importance will be exploration of feasibility of studying major policy issues permeating child welfare services in New York City.
Duration: July 1964-indefinite.
Investigator(s): David Fanshel, D.S.W., School of Social Work, Columbia University, New York 28, N. Y.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-15 A PROGRAM OF CHILD WELFARE RESEARCH AT THE JEWISH BOARD OF GUARDIANS

Purpose: This program of research is directed to one of the fundamental issues in child welfare, namely the avoidance of total separation and placement.
Methods: The placement decision will be analyzed and evaluated in terms of four dimensions: (1) level of personality growth and general well-being of child; (2) the constellation of factors bearing on the capacity of the family to provide nurture and protection for the child; (3) availability to the child of community resources to meet basic social needs as well as to supplement family capacity; and (4) the standards and norms of the placement agency itself, and as a surrogate of the community.
Duration: July 1964-June 1965.
Investigator(s): Herschel Alt, M.A., Executive Vice President, Peter B. Neubauer, M.D., Consultant Psychiatrist, and John Mann, Ph.D., Research Advisor, Jewish Board of Guardians, 120 W. 57th St., New York, N. Y. 10019.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-16 CHILD WELFARE PROGRAM OF RESEARCH

Purpose: To undertake a continuing research program in child welfare directed toward investigating theory and practice relative to provision of foster care. "Separation" is proposed as central organizing theme not merely because it is always involved in foster care, but because it appears to offer a fruitful focus for development of major theoretical formulations which may provide better bases for the two crucial decisions involved in providing foster care: (1) is foster care the suitable treatment method? and (2) what form of foster care should be provided?
Duration: August 1964-1969.
Investigator(s): Lilian Ripple, Ph.D., Director, Research Center, School of Social Service Administration, University of Chicago, Chicago, Ill. 60637.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-17 CHILD WELFARE STUDY OF ONONDAGA COUNTY, NEW YORK

Purpose: To identify children for whom agency services are requested, what services or care are available to them, what happens to those not accepted, and what additional services are needed but not available in the community.
Subjects: Children for whom a request for service was made between November 1963 and October 1964 in the following children's agencies (all of which offer some form of placement): Catholic Welfare, Child and Family Service, Children's Division, Jewish Family Service, and Probation Department.
Methods: Design provides for systematic data on all children receiving service in above agencies on a Census Day. State Department of Parole and 14 hospitals and schools serving mentally retarded, emotionally disturbed, or physically handicapped children also participated in this phase, providing similar information on all children up to 19 years from Onondaga City who were under care. Special forms used by staffs of the five participating agencies for Intake Study. In addition, a project worker visits agencies and secures further information. Referrals and refused requests are followed up by a project worker. All Census Day data is provided on prepared schedules. Other community agencies will be involved in a questionnaire and inventory related to resources.
Duration: January 1963-September 1965.
Investigator(s): Dorothy Giles, M.S.S., Project Director, Ruth Rothman, M.S.S., and Janet Weinandy, M.S.S., Social Workers, Child Welfare Study, United Community Chest and Council of Onondaga County, Syracuse, N. Y., and Bettye Caldwell, Ph.D., Research Consultant, Department of Pediatrics, Upstate Medical Center, State University of New York, Syracuse, N. Y.
Cooperating group(s): Onondaga County Mental Health Department; New York State Department of Social Welfare; Rosamond Gifford Charitable Corporation.
Publication: Material to be available through United Community Chest and Council of Onondaga County.

18-Y-18 CHILD WELFARE PROBLEMS IN AFRICAN DEVELOPING COUNTRIES

Purpose: To explore the special social and health needs of children under rapid change of industrial and political conditions in the newly independent countries of Africa.
Subjects: Children of families disrupted by urban attraction of village people to new industrial centers; children whose parents engage in industrial work; and children whose parents are working or remain in native villages.
Methods: (1) A systematic survey of the findings of the various international conferences sponsored by the United Nations or affiliated agencies (i.e., United Nations International Children's Emergency Fund, World Health Organization, Food and Agricultural Organization), the International Child Welfare

Union, as well as child welfare organizations in the United States and in several European nations concerned with community development; and (2) interviews and correspondence with experts assigned to African countries.
Findings: An urgent need for developing and strengthening family and child welfare services consonant with the specific cultural, religious, health conditions and habits of the various African countries, frequently different from Western society.
Duration: 1963-1964.
Investigator(s): Walter A. Friedlander, Ph.D., Professor of Social Welfare Emeritus, University of California, Berkeley, Calif.
Publication: To be submitted to appropriate journals.

18-Y-19 PROVISION OF CHILD WELFARE SERVICES WITH CHILDREN AND PARENTS AT HOME BY WORKERS WITHOUT PROFESSIONAL SOCIAL WORK EDUCATION

Purpose: To demonstrate what child welfare services can be given by workers without professional social work education, who receive special on-the-job training and professional supervision. Specifically: (1) to develop new or modified techniques for working with clients; (2) to devise means which can be used for better problem identification and client evaluation; (3) to work with community planning groups in order to coordinate community resources for a combined effort in meeting client needs; (4) to identify services these workers are able to provide; (5) to study content and method of training, and evaluate results on basis of worker performance at stages of training and experience; and (6) to determine size of manageable caseloads.
Subjects: Cases are selected from Aid to Families with Dependent Children caseload of Texas Department of Public Welfare.
Duration: 1963-indefinite.
Investigator(s): Price Parker, M.S.W., Regional Service Supervisor, Texas State Department of Public Welfare, Dallas 2, Tex.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-20 ALTERNATIVE DEPLOYMENT OF PUBLIC ASSISTANCE AND TRAINED CASEWORK PERSONNEL

Purpose: To assess the consequences of alternative assignments of public assistance and trained casework personnel in the Department of Welfare of the city of New York.
Subjects: 2500 clients, parents and children, served by a selected welfare center of the Department of Welfare.
Methods: Primarily "before" and "after" tests of dependent variables measuring "outcome," using structured interviews and selected records concerning knowledge, motivations, and behavior.
Findings: Initial findings should be available by June 1965; final results by June 1966.
Duration: July 1964-May 1966.
Investigator(s): Lawrence Podell, Ph.D., Director of Social Research, New York City Department of Welfare, 250 Church St., New York 13, N. Y.
Cooperating group(s): Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-21 CONTINUOUS CASE LOAD ANALYSIS PROJECT

Purpose: To develop a statistical reporting system for child welfare agencies designed to provide, by means of an annual census, systematic information on qualitative and quantitative aspects of an agency's client population and

483

services to this population. System is intended to be applicable with appropriate modifications to other types of social welfare agencies.
Subjects: Total client population of Massachusetts Society for Prevention of Cruelty to Children.
Methods: (1) Development of data collection instrument; (2) testing instrument through statewide application on a quarterly basis with entire active caseload; and (3) modifying instrument on basis of staff experience during the several applications.
Duration: October 1963-March 1965.
Investigator(s): David G. Gil, D.S.W., Director of Research, Massachusetts Society for The Prevention of Cruelty to Children, 43 Mt. Vernon St., Boston 8, Mass.
Publication: Description of instrument and discussion of procedures to be published in a social work journal.

18-Y-22 A STUDY OF THE EFFECT OF TRAINING ON PERFORMANCE OF GROUP LEADERS SERVING ON A PART-TIME BASIS UNDER SUPERVISION OF PROFESSIONALLY TRAINED GROUP WORKERS

Purpose: To evaluate effectiveness of leadership training techniques in providing more effective work with children in groups; to compare group leadership training and direct supervisory conference methods; to study effect of training on learning abilities of part-time group leaders; and to examine way in which leadership training influences direct program services.
Methods: (1) Intensive record keeping on leadership training experience; (2) study of leadership attitudes before and after training program; and (3) examination of program content in relation to program.
Duration: 1963-1966.
Investigator(s): Jack Weiner, M.S.W., Assistant Director, Meyer Bass, M.S.W., ACSW, Executive Director, Richard Rabin, M.S.W., Director, Children and Youth Division, Rod Eglash, M.S.W., Tween and Youth Worker, Jewish Community Center of Milwaukee, 1400 N. Prospect St.; and Ferne Katleman, M.S.W., School of Social Work, University of Wisconsin, Milwaukee, Wis.
Publication: To be published in Jewish Community Center Program Aids, Journal of Jewish Communal Service, Social Work, and similar periodicals.

18-Y-23 A STUDY OF COUNSELOR-IN-TRAINING PROGRAM IN A SUMMER DAY CAMP AS IT AFFECTS CAREER CHOICES OF PARTICIPANTS

Purpose: To determine how an intensive counselor training program can be used to interest young teenagers in problems of child care and training for professional work.
Subjects: Teenagers.
Methods: Intensive record keeping on individuals in program; follow-up interviews after completion of program; and study of attitudes before and after training.
Duration: June 1963-1966.
Investigator(s): Rod Eglash, M.S.W., Youth Director, Jack Weiner, M.S.W., Assistant Director, and Richard Rabin, M.S.W., Director of Children and Youth Division, Jewish Community Center of Milwaukee, 1400 N. Prospect Ave., Milwaukee, Wis. 53202. (Reported by Meyer Bass, M.S.W., ACSW, Executive Director, Jewish Community Center of Milwaukee.)
Publication: To be published in Social Work, Journal of Jewish Communal Service, Jewish Community Center Program Aids, and similar periodicals.

18-Y-24 OPPORTUNITIES FOR YOUTH: A COMMUNITY ACTION AND RESEARCH PROJECT

Purpose: (1) To provide on-the-job training for young boys in general vocational skills such as responsibility, reliability, and conscientiousness; (2) to provide remedial educational guidance geared to boys' work experience; and (3) to alter participant's attitudes toward their educational and occupational potentials so that they can make more effective use of other educational and vocational programs provided by schools and other community projects.
Subjects: 14 and 15 year old boys (N=140) in 4 high-delinquency public housing projects in Seattle; equal number of boys for controls.
Duration: 1963-1965.
Investigator(s): Joseph L. Thimm, Acting Director, and staff, Metropolitan Youth Development Committee, Inc., 107 Cherry St., Seattle 4, Wash. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1963-1964.)
Cooperating group(s): Seattle Housing Authority; Municipal Advisory Commission on Youth (City of Seattle).

18-Y-25 NEIGHBORHOOD APPROACH TO MEXICAN-AMERICAN GANGS

Purpose: To test the effectiveness of a total neighborhood program on the reduction of "conflict gangs" within low income Mexican-American neighborhoods.
Subjects: Gang and pre-gang boys (young junior high school boys), parents of both, and significant adults within the two neighborhoods being studied.
Methods: A method of service will be used which is generic social work in that the individual, group and community will all be worked with. A sociologist will use standard procedures to evaluate this method.
Duration: June 1964-May 1967.
Investigator(s): Buford Farris, M.A., M.S.S.W., Executive Director, William Hale, M.S.S.W., Associate Director of Service, and Richard Brymer, (Ph.D. Candidate), Wesley Community Centers, 150 Colima St., San Antonio, Tex. 78207.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

18-Y-26 TOWARD SUPPORT OF A DEMONSTRATION PROJECT TO TEST AND EVALUATE THE SIGNIFICANCE OF A WORK CAMP EXPERIENCE IN PREVENTING SCHOOL DROPOUTS

Purpose: To test the work camp situation as an appropriate environment and instrumentality, supplementing the efforts of the schools and directed toward manpower improvement.
Methods: Using Turkey Mountain Camp as the setting, program content consists of work experience, independent study, recreation, guidance, outdoor life, and group experience.
Findings: Work camp experience for a high school boy having difficulty in school can be most significant. Project will be expanded if funds can be secured.
Duration: Summer 1962-1968.
Investigator(s): Domenick Allagio, M.A., Bayside High School, Flushing, L.I., N. Y. (Reported by Samuel C. Weir, Executive Director, Child Service League, 92-32 Union Hall St., Jamaica 33, N. Y.)
Cooperating group(s): W. T. Grant Foundation.
Publication: Yearly reports.

18-Y-27 COMMUNITY ACTION PROGRAM (CAP)

Purpose: To determine effective methods whereby a small professional staff,

within a limited time period, can help a multiproblem neighborhood to mobilize its resources and capacities for community improvement so that families and children will have greater opportunities for wholesome development.
Methods: Basic methodology is rooted in social work principles of involving the residents, the professionals, and the indigenous leaders in the process of identifying community problems and working toward their amelioration or resolution. Research efforts are pre-evaluative in nature and are geared to the analysis and assessment of action programs.
Duration: July 1961-1964.
Investigator(s): Sophie Engel, Director, and staff, Community Action Program, 2804 Third Ave., Bronx, N. Y. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1963-1964.)
Cooperating group(s): New York City Youth Board; Community Service Society.

18-Y-28 AVAILABILITY AND UTILIZATION OF RECREATION RESOURCES FOR CHRONICALLY DISABLED CHILDREN IN THE UNITED STATES

Purpose: To evaluate extent of recreation services offered to disabled children, and degree to which these children are needlessly segregated.
Methods: Extent of chronic disability in eight representative Standard Metropolitan Areas will be estimated from existing data; recreative programs available for various types and degrees of disability will be determined by a questionnaire and field survey. From these parameters, major deficiencies in service will be calculated. These data can then serve as a guide to further projects to improve recreation services in these areas and as a baseline from which to measure improvement achieved.
Duration: 1964-indefinite.
Investigator(s): John E. Silson, M.D., M.P.H., Research Coordinator, Doris L. Berryman, M.A., and William E. Knott, M.A., Recreation Specialists, Comeback, Inc., 16 W. 46th St., New York, N. Y. 10036.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

18-Y-29 A STUDY OF THE PROBLEMS OF INTEGRATING PHYSICALLY HANDICAPPED CHILDREN WITH NONHANDICAPPED CHILDREN IN RECREATIONAL GROUPS

Purpose: To conduct a research and demonstration program in the integration of physically handicapped children with nonhandicapped children in recreational groups; to evaluate efficacy of program in terms of identified variables indicative of "success" or "failure"; to examine whether there is any change in self-image of handicapped child, his peer relationships, and various aspects of his family adjustment; to examine attitudes of nonhandicapped children and their parents toward handicapped; and to identify factors that may make it possible to serve handicapped and children with special needs more effectively in normal community center setting.
Subjects: 35 handicapped children, nonhandicapped children, and their families.
Methods: An interdisciplinary approach utilizing medical and casework consultation in support of a group work and recreational program.
Duration: October 1962-November 1965.
Investigator(s): Victor D. Sanua, Ph.D., Director of Research, and Douglas Holmes, Ph.D., Associate Director of Research, Associated YM-YWHA's of Greater New York, 33 W. 60th St., New York 23, N. Y.
Cooperating group(s): Jewish Family Service; Montefiore Hospital; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

RESEARCH NOTES

RESEARCH CENTER ON LEARNING PROBLEMS

The first national center to study learning problems is soon to be established at the University of Wisconsin. Under a cooperative agreement between the University and the U. S. Office of Education, the center will carry out a program of research under the co-direction of Dr. Herbert Klausmeier and Dean Lindley Stiles. Federal support will be given over an initial period of five years.

CLEARINGHOUSE FOR INFORMATION ON DISADVANTAGED

An Information Retrieval Center on the Disadvantaged has recently been established in the Graduate School of Education, Yeshiva University, New York, N. Y. The IRCD is designed to serve "as a clearinghouse for information concerning problems, theory, research, programs and practices, materials and other developments in the field of compensatory education on elementary, secondary, and collegiate levels," both nationally and internationally. The *IRCD Bulletin*, a semimonthly publication of the Center, includes recent news and selected bibliographies. Services of the Center are available to interested professionals at a nominal charge.

NEW BIBLIOGRAPHIES ON DISADVANTAGED

Under a grant from the U. S. Office of Education, the Center for Cultural Studies of Adams State College (Alamosa, Colo.) has compiled an annotated bibliography of resource materials on migrants and the culturally and educationally disadvantaged. The official publication title is: *Guide to Resource Materials--knowing and educating migrant, culturally disadvantaged, undereducated adults*. The Guide includes references to materials on all aspects of educating the undereducated adult and child, their personal characteristics and culture, and the society of which they are a part.

A new selected bibliography entitled *A Guide to Resources for Antipoverty Programs* is available from the Federation Employment and Guidance Service, 215 Park Avenue South, New York, N. Y. 10003. A "Selected List of Recent Basic Readings Related to the War on Poverty" is appended to the 18-page Guide.

HEW GRANTS SUMMARY NOW AVAILABLE

A recent HEW publication summarizes financial aid programs administered by that agency. *Grants-in-Aid and Other Financial Assistance Programs Administered by the U. S. Department of Health, Education, and Welfare, 1964-65* contains descriptions of each type of financial aid--"its purpose; financing; method by which Federal funds are distributed; matching requirements, where these apply; who may receive Federal funds; how application for funds is made; significant developments during the past year; and the legal basis under which funds are made available." The publication may be obtained at a cost of $2.50 from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, and may be found in many libraries.

REVISED MENTAL RETARDATION AND ABUSED CHILD LISTINGS

Research Relating to Mentally Retarded Children, first published by the Children's Bureau Clearinghouse in 1960, is currently being revised to include studies reported to the Clearinghouse between August 1959 and December 1964. The updated publication is expected to be available in late 1965. Also undergoing revision is the "Bibliography on the Battered Child"; copies should be available in fall 1965.

OTHER ABSTRACTING JOURNALS AND SERVICES

Child Development Abstracts and Bibliography, Child Development Publications, Society for Research in Child Development, Inc., Purdue University, Lafayette, Ind.
Digest of Neurology and Psychiatry, Institute of Living, Hartford, Conn.
Dissertation Abstracts, University Microfilms, Ann Arbor, Mich. (Gives synopses of U. S. doctoral dissertations with an annual index.)
dsh Abstracts, Deafness, Speech and Hearing Publications, Gallaudet College, Washington 2, D. C.
Excerpta Criminologica, New York Academy of Medicine Bldg., 2 E. 103rd St., New York 29, N. Y.
Inventory of Social and Economic Research in Health, Health Information Foundation, 420 Lexington Ave., New York 17, N. Y.
Listing of Health and Welfare Research Projects in Local Communities, United Community Funds and Councils of America, Inc., 345 E. 46th St., New York 17, N. Y.
Nursing Research, American Journal of Nursing Co., 10 Columbus Circle, New York, N. Y.
Nutrition Abstracts and Reviews, Rowett Research Institute, Bucksburn, Aberdeenshire, Scotland.
Psychological Abstracts, American Psychological Association, 1333 - 16th St., N. W., Washington 6, D. C.
Rehabilitation Literature, National Society for Crippled Children and Adults, 2023 W. Ogden Ave., Chicago 12, Ill.
Research and Study Projects Reported by FSAA Member Agencies, Family Service Association of America, 215 Park Ave. South, New York 3, N. Y.
Sociological Abstracts, Leo P. Chall, 225 W. 86th St., New York 24, N. Y.
Sources of Morbidity Data, Clearinghouse on Current Morbidity Statistics Projects, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington 25, D. C.

The Excerpta Medica Foundation, New York Academy of Medicine Bldg., 2 E. 103rd St., New York 29, N. Y., has established an abstracting service on pediatrics on a yearly subscription basis. In addition to abstracts, Excerpta Medica can provide to subscribers, at cost, photocopies and translations of complete articles.

The Human Relations Area Files have classified cultural data on primitive and non-primitive societies into 710 categories of human behavior. Complete sets of all files are available in 22 member institutions in the United States. For information, write to Dr. Clellan S. Ford, President, Human Relations Area Files, Yale University, New Haven, Conn. 06520.

The Science Information Exchange, Smithsonian Institution, 313 Universal Bldg., Connecticut and Florida Aves., N. W., Washington 6, D. C., provides to qualified investigators on request selected abstracts of current research supported by foundation or government grants. The Exchange covers such fields as medicine, nursing, public health, nutrition, psychology, education, anthropology, mental health, and intercultural relations.

The World Federation for Mental Health, 19 Manchester St., London W.1, England, operates a clearinghouse for research and study projects in the field of mental health.

In addition to these journals and services, many professional journals in such fields as pediatrics and mental deficiency include a section of abstracts regularly or once a year. There are also a number of indexes and abstracting journals in the medical area which occasionally refer to materials in the area of child development.

CHILDREN'S BUREAU
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE
WASHINGTON, D.C. 20201

If you or your colleagues are currently engaged in research on children or their families, we would greatly appreciate your cooperation in providing a short summary of your work for inclusion in the next issue of *Research Relating to Children.*

The Clearinghouse is the branch of the Children's Bureau which collects and disseminates information on current research relating to children and their families. Its purpose is to provide research investigators with information about other research in progress, to point up gaps in present research, and thereby to stimulate more effective research.

The instructions on the third page of this form will serve as a guide for your summary. You will, of course, receive a free copy of the issue in which your study appears.

If you know of others doing research which might be of interest to the Clearinghouse, please give name(s) and address(es) below:

____

____

Thank you for your cooperation.

SUMMARY OF RESEARCH PROJECT

Title:

Purpose:

Subjects (sample):

Methods:

Findings to date, if any:

Date project initiated: Estimated terminal date:

Principal investigator(s) only Degree Position and organization

Cooperating groups (in the research or in the funding of the research):

Publication references and/or plans (If no publication is planned, please indicate under what conditions data and results will be available):

If this represents work toward an academic degree, please state degree ____________________.
(Please do not report master's theses unless they represent work beyond a doctorate, as in dentistry.)

INSTRUCTIONS

Please report studies in progress (or recently completed) which:

center on children or their families in such areas as child growth and development, intelligence, personality, education, social adjustment, family life, physical and emotional disorders, etc.

concern service programs in the fields of child health, child welfare, or special education

Please *DO NOT* report:

studies already reported to the Clearinghouse

purely medical studies limited to morphology or physiology, the physical aspects of etiology, epidemiology or symptomatology of diseases or handicapping conditions, surgery, chemotherapy, antibiotics or physical therapy; biochemical or other laboratory studies; animal studies

educational studies of curriculum construction or materials, teaching methods, surveys of school facilities or needs, general school administration studies

studies already published in sources generally available in major libraries across the country

demonstration projects, unless there is a formal plan for evaluation

studies of test development, standardization, or validation, except for special groups of children such as blind or retarded

regularly collected material such as annual reports, work preparatory to writing handbooks; directories; research based on secondary sources

master's theses, unless they represent work beyond a doctorate, as in dentistry

Previous Issues of

RESEARCH RELATING TO CHILDREN

Single copies of the following issues are available without charge from the Clearinghouse, Children's Bureau, Washington, D. C. 20201:

Bulletin II, Supplement 2 (November 1952-May 1954)
Bulletin II, Supplement 3 (April 1954-January 1955)
Bulletin II, Supplement 4 (February-November 1955)

Copies of the following issues are available from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402:

Bulletin 4 (May-September 1956) - 75 cents
Bulletin 9 (August 1958-February 1959) - $1.00
Bulletin 16 (July 1962-January 1963) - $1.00
Bulletin 17 (February 1963-February 1964) - 75 cents

The following issues are OUT OF PRINT:

Bulletin I (December 1948-June 1949)
Bulletin I, Supplement 1 (July 1949-March 1950)
Bulletin I, Supplement 2 (April-July 1950)
Bulletin I, Supplement 3 (August-December 1950)
Bulletin I, Supplement 4 (January-April 1951)
Bulletin I, Supplement 5 (May-December 1951)

Bulletin II (January-October 1952)
Bulletin II, Supplement 1 (January 1952-March 1954)

Bulletin 3 (December 1955-April 1956)
Bulletin 5 (October 1956-February 1957)
Bulletin 6 (March-July 1957)
Bulletin 7 (August 1957-February 1958)
Bulletin 8 (March-July 1958)
Bulletin 10 (March-July 1959)
Bulletin 11 (August 1959-February 1960)
Bulletin 12 (February-July 1960)
Bulletin 13 (August 1960-January 1961)
Bulletin 14 (February-September 1961)
Bulletin 15 (October 1961-June 1962)

An investigator receives a free copy of the issue of Research Relating to Children in which his study appears. Additional free copies are available to directors of research centers and to libraries upon direct request to the Clearinghouse, Children's Bureau, Washington, D. C. 20201.

The Clearinghouse will be happy to add anyone to the mailing list to be notified whenever a new issue is published.

AND ITS
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE . . . .

The Children's Bureau was established in 1912 to "investigate and report. . . . upon all matters pertaining to the welfare of children and child life among all classes of our people." From this beginning, the Bureau has extended its activities into such areas as developing standards of care for children and providing funds to States to improve conditions for children. More recently, the Bureau has established several new grants programs to support research in areas of maternal and child health and child welfare.

In keeping with the basic act establishing the Bureau, the Clearinghouse for Research in Child Life was set up in 1948. Its function is to collect information about current research with children in order to keep investigators informed of the work of other investigators, to point up gaps in present research, and hopefully to stimulate more effective research programs.

Investigators reporting a study to the Clearinghouse receive a free copy of the issue of *Research Relating to Children* in which their study appears. Additional free copies of each issue are sent to directors of research programs and to libraries. Individuals may purchase copies from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. The Clearinghouse maintains a mailing list of persons to be notified whenever a new issue is published, usually twice a year.

The Children's Bureau Clearinghouse routinely exchanges information with other clearinghouses in related fields such as the National Research and Information Center on Crime and Delinquency of the National Council on Crime and Delinquency, and the U.S. Public Health Service Clearinghouse on Current Morbidity Statistics Projects. The Science Information Exchange is very helpful in providing abstracts of research supported by federal funds and by large foundations.

The major source of information, however, is the individual research investigator, whose help is essential in obtaining the most complete and up-to-date coverage possible.

CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE

For sale by the Superintendent of Documents, U.S. Government Printing Office
Washington, D.C., 20402 - Price $1.50 cents

FOREWORD

This Bulletin like previous issues, includes reports of research in progress or research very recently completed. It does not report again studies included in Bulletin 3 through 18 even though they are still continuing. This issue, therefore, does not reflect all research relating to children in a given period but only that which was first reported to the Clearinghouse January 1, 1965 through September 30, 1965.

The Clearinghouse has only such information about the research projects as the abstracts provide. Publication references and plans are given for some of the projects, but the Clearinghouse cannot attempt to keep track of the final publication of the studies. The reader who wishes to obtain further information about any of the projects reported should write directly to the investigator or check professional jornals in the appropriate field.

For the Clearinghouse, I wish to thank those who have submitted reports and to acknowledge the valuable assistance of the National Clearinghouse on Mental Health Information, the Science Information Exchange, and the several foundations which provide us with information about recent research grants.

To Research Investigators:

This publication is only as complete as you are willing to make it. Page 247 is a form for letting us know of other investigators who are working in the field. Page 250 is a form for reporting your own current research. Please let us hear from you.

Clearinghouse for Research in Child Life

LONG TERM RESEARCH

Note: The reports in this section concern research programs which are more or less continuous.

19-AA-1 GROWTH, DEVELOPMENT, AND ADAPTATION OF HUMAN INDIVIDUALS

Purpose: To gain greater understanding of many factors involved, prenatal and postnatal, as an individual is in the process of becoming the kind of a person he is as an adult.
Subjects: Approximately 100 middle class families in Denver, Colorado, including 210 offspring of whom over 50 are second generation followed in the institute. (80 percent of subjects entered since 1930 are still being followed.)
Methods: Each subject followed from birth at regular intervals studying: (1) pattern of changing structure by direct measurements, X-rays, and photographs; (2) development of personality traits, starting with family during prenatal period and carried on intensively with infant, child, and adult; (3) patterns of physiological development including nutrition, biochemical and physiological tests, and evaluation of healthiness.
Duration: 1927-continuing.
Investigator(s): Robert W. McCammon, M.D., Director, Child Research Council, University of Colorado, 4200 E. Ninth Ave., Denver 20, Colo.
Cooperating group(s): University of Colorado; Commonwealth Fund; McDonald Foundation; Nutrition Foundation; National Live Stock and Meat Board; Gerber Company; Lawrence Phipps Foundation; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Appropriate medical or scientific journals every year. Publication lists available.

19-AA-2 ANALYSIS AND EVALUATION OF DATA FROM THE LONGITUDINAL STUDY OF CHILD HEALTH AND DEVELOPMENT BASED UPON MULTIDISCIPLINE AND PERIODIC OBSERVATIONS OF INDIVIDUAL CHILDREN FROM BIRTH TO 18 YEARS

Initiation date: 1930.
Investigator(s): Research has been discontinued but the analyses of data and preparation of reports are being continued by individuals under the direction of Robert B. Reed, Ph.D., Professor of Biostatistics, Harvard School of Public Health, 55 Shattuck St., Boston 15, Mass.

19-AA-3 LONGITUDINAL STUDY OF CHILD GROWTH AND DEVELOPMENT

Purpose: Program consists of study of adult personality, adjustment and aging processes of individuals whose health, growth, personality development, and environment have been studied since birth. It included a study of the aging processes of their parents in relation to physical and biochemical measures made earlier. It will include studies of: parental child-rearing attitudes and practices of two generations in the same families; constancy of autonomic response patterns to stress from childhood to young adulthood and their relationship to psychosomatic disorders in adulthood; blood lipids in relationship to body composition and change in composition.
Investigator(s): Lester W. Sontag, M.D., Director, Fels Research Institute for the Study of Human Development, Antioch College, Yellow Springs, Ohio.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

19-AA-4 LONGITUDINAL CROSS-CULTURAL STUDY OF HUMAN DEVELOPMENT

Purpose: To observe the long term effects of environment upon growth and health, that is, the influence of environmental factors upon physical and mental development, and the elucidation of their mode of action and interaction with genetic endowment.
Subjects: Several hundred males followed from prepuberty, all with four grandparents from the same limited geographical zone of southern Italy but now living in the markedly different cultures of Boston, Rome, and Palermo; other groups of 100 girls and several hundred boys in Florence, Italy and 200 girls in Boston.
Methods: Repeated medical, anthropometric and psychological examinations together with family interviews (with evaluation of child-rearing practices), nutrition, and socio-cultural data.
Findings: Reported in numerous articles in American and European journals. Current work under analysis includes cross-cultural study of moral values, studies of biological age and its estimation, estimation of socio-economic status across cultures, blood groups and temperament, and changing hemoglobin values in adolescent males. Work involving further and continuing data collection includes prediction of growth variables, cross-cultural study of creativity and its environmental determinants, a study of left handed subjects in the relatively "permissive" and "intolerant" cultures of the United States and Italy, and an analysis of menstrual symptoms in both cultures.
Duration: 1956-1968.
Investigator(s): Harben Boutourline Young, M.D., Assistant Professor of Physiology, Harvard School of Public Health, Boston 15, Mass.
Cooperating group(s): Grant Foundation; Wenner Gren Foundation; Olivetti Corporation; Universities of Florence, Rome, and Palermo.
Publication: Numerous journal articles; one book is planned, another possible.

19-AA-5 BIOLOGIC AND ENVIRONMENTAL FACTORS IN CHILD DEVELOPMENT

Purpose: To investigate the relationship of biologic, genetic, and environmental factors in the parents--including events during pregnancy, labor, and delivery--to normal and abnormal development of offspring. Expected by-products of investigation are relationships of these factors to pregnancy wastage in the form of early fetal death, perinatal mortality, infant and childhood mortality, and estimates of incidence of different types of abnormalities. In addition, detailed growth curves for children from birth to six years of age will be derived on a longitudinal basis, and estimates of illnesses and injuries in infancy and the preschool child will be derived.
Subjects: Members of the Kaiser Foundation Health Plan--a prepaid medical care program--who reside in the San Francisco-East Bay area.
Methods: Study is of a prospective, longitudinal type for both mother and child. Observations are made on the gravidas in the Department of Obstetrics and Gynecology, and on the children in the Pediatric Department, and are supplemented by special interviews and laboratory examinations. Physicians' observations are systematized and made more uniform. Special efforts are made to obtain information on members of study who do not return to the plan for medical care.
Duration: July 1959-indefinite.
Investigator(s): Jacob Yerushalmy, Ph.D., Professor of Biostatistics, University of California, Berkeley; Alexander L. King, M.D., Director of Pediatrics; and Robert W. King, M.D., Consultant, Department of Obstetrics and Gynecology, Kaiser Foundation Hospital, Oakland, Calif. (Reported by C. H. Peckham, M.D., 3783 Piedmont Ave., Oakland, Calif. 94611.)
Cooperating group(s): Division of Biostatistics, School of Public Health, University of California; Permanente Medical Group; Kaiser Foundation Research Institute.
Publication: Yerushalmy, J., "Statistical Considerations and Evaluations of Epidemiological Evidence," in Tobacco and Health, Chas. C. Thomas, publisher, 1962. American Journal of Obstetrics and Gynecology 87:5:609-620, November 1, 1963; 88:4:505-518, February 15, 1964. Vox Sanguinis 8:376-377, May-June 1963; 8:549-556, September-October 1963; 9:502-504, 1964. Human Biology 36:2:86-103, May 1964. Obstetrics and Gynecology 24:5:707-715, November 1964. American Journal of Diseases of Children 109:43-57, January 1965.

19-AA-6 THE BERKELEY (CALIFORNIA) GROWTH STUDY

Purpose: A study of the mental and physical growth of approximately 50 normally healthy persons from birth in 1928-29 to the present (35 years).
Subjects: Full term, healthy newborns, born in Berkeley, California hospitals of white, English-speaking parents, if parents were interested--a somewhat selected above average group. 100 offspring of these subjects, age range from a few months to about 16 years, seen irregularly, but the same data (appropriate for age) are collected that were collected for their parents.
Methods: Tests of mental and motor development; pediatric examination; interviews at frequent intervals during growth beginning in first week of life. At all visits, inquiries made concerning current health and recent illnesses. Anthropometrics, body photographs and skeletal X-rays taken at most ages. Socio-economic data available. Comparisons now being made on variety of collected data. Studies of physical aspects of children's growth include analyses comparing health histories with physical growth and with skeletal maturation. Some parent-child relations in susceptibility to illness could be studied. Emotional and other personality variables studied for consistency, and in various interrelations with maternal behavior in infancy, birth histories, socio-economic status, intellectual and physical growth.

Duration: 1928-continuing.
Investigator(s): Nancy Bayley, Ph.D., and Dorothy H. Eichorn, Ph.D., Associate Research Psychologist, Institute of Human Development, University of California, Berkeley 4, Calif.
Cooperating group(s): Institute of Human Development, University of California.
Publication: Studies in the Development of Young Children, University of California Press, 1940. Growth Diagnosis, University of Chicago Press, 1959. Child Development 12:167-173, 1941; 27:45-74, 1956. American Psychologist 10:805-818, 1955. Monograph, Society for Research in Child Development 28, 1963.

19-AA-7 THE MEDFORD, OREGON BOYS' GROWTH STUDY, 7 TO 18 YEARS

Purpose: To construct structural, strength, and motor cross-sectional, convergence, and longitudinal growth curves for boys 7 to 18 years of age; to study individual differences at all ages; to relate the various structural, strength, and motor tests to maturity, physique type, social-personal adjustment, interests, and scholastic aptitude and achievement; to contrast all traits for boys at different levels of athletic ability.
Subjects: Cross-sectional sample: 40 boys at each age, 9 through 15 years. Longitudinal sample: over 100 boys at each age, 7, 9, 12, and 15 years.
Methods: (1) Construction of mean growth curves; study of individual differences by use of range, standard deviation, and coefficient of variation; (2) contrast of maturity groups and somatotype categories; (3) factor analyses at single ages; (4) contrast of athletes and nonparticipants, longitudinally and cross-sectionally; and (5) determination of relationships through correlation, multiple correlation, and partial correlation; utilization of multiple regression equations.
Duration: October 1956-May 1968.
Investigator(s): H. Harrison Clarke, Ed.D., Research Professor of Physical Education, University of Oregon, Eugene, Oreg.
Cooperating group(s): Medford, Oregon Public Schools; Southern Oregon College; Athletic Institute; Curriculum Development Fund of the Oregon State Department of Education; Office of Scientific and Scholarly Research and School of Education In-Service Program, University of Oregon.
Publication: To date, 34 completed master's theses and doctoral dissertations are available in Microcard form; a number of articles and review statements have been published.

19-AA-8 PATTERNS OF SOOTHING AND EXCITATION IN NEONATES

Purpose: To investigate the role of excitatory and inhibitory patterns in neonatal development through use of behavioral ratings and heart rate measurements. This research is part of a long-term study of regulatory principles and mechanisms which govern neonatal behavior (see Bulletin 5, Research Relating to Children).
Subjects: Normal, healthy, 2 to 5 day old full term babies born at Bronx Municipal Hospital Center.
Methods: Heart rate and behavioral ratings obtained for all experimental sessions. Each neonate tested at three sessions: test, retest on reactions to a series of soothing stimuli, and one session of trials of excitatory stimuli. Soothing stimuli applied when neonates are aroused are a tone, rocking, sweetened pacifier inserted in babies' mouths, immersion of babies' feet in warm water, and a control period. Each stimulus condition applied three times. Excitatory stimuli applied after

BEST COPY AVAILABLE

feeding when neonates are quiescent are a tone, cold disc applied to the abdomen, and rocking.
Findings: Data analyzed with respect to (1) relationship between heart rate and behavioral ratings; (2) individual differences in overall soothability and in most effective soothing stimuli; (3) test-retest reliability on successive days; and (4) relationship between excitatory and inhibitory patterns.
Duration: January 1962-continuing.
Investigator(s): Sibylle Escalona, Ph.D., Professor of Psychology in Psychiatry, Wagner H. Bridger, M.D., Assistant Professor of Psychiatry, Beverly M. Birns, Ph.D., and Marion Blank, Ph.D., Instructors in Psychology, Department of Psychiatry, Albert Einstein College of Medicine, Yeshiva University, New York 61, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-AA-9 INSTITUTE FOR CHILD STUDY OF PHILADELPHIA

Purpose: To develop standards and norms of physical growth, specific for children of urban Philadelphia. Longitudinal study based on annual or semiannual follow-up of more than 2,000 children registered at the Institute.
Methods: School Series: initially based on 600 school children in 5 schools (now 22 schools), ages 6-12, "normal" medically and dentally; data collected on national and ethnic background, socio-economic status of parents, medical and dental health history of child, height and weight of parents and siblings, anthropometric measurements and X-rays. American Negro Series: 150 Negro children with normal occlusion selected to study with a view to establishing tentative standards of facial growth. Pilot Study Series: extensive study of 75 children, 6 to 8 years of age, seen every three months for measurements, X-rays, dietetic histories, careful medical examination data, blood chemistry, oral pathology data, etc. Orthodontic Series: all children accepted by Orthodontic Clinic had lateral and postero-anterior head films taken and detailed measurements of head and face made. Orthodontic Treatment Series: a small pilot study of 15 white boys, age 11 to 15, with a certain type of malocclusion accompanied by V-shaped, high-vaulted palate; 15 with identical orthodontic condition; 15 with normal occlusion--first group to receive free orthodontic care, second and third groups to receive free dental care but no orthodontic treatment. Cleft Palate Series: growth pattern of 250 children with cleft lip and/or palate. Cooley's Anemia Series: family-line investigation of 25 children for traits other than the disease such as facio-dental growth dysplasia. Endocrine Series: evaluation of degree of growth deviation with follow-up to study effect of endocrine therapy upon growth pattern. Behavioral Series: 110 first, second, and third graders rated in terms of physical growth progress and simultaneously in terms of grades, emotional stability, and other aspects of classroom behavior to see if there is any real correlation.
Duration: 1947-1967.
Investigator(s): Wilton M. Krogman, Ph.D., Director, Philadelphia Center for Research in Child Growth; and F. E. Johnston, Ph.D., Assistant Professor of Anthropology, University of Pennsylvania, Philadelphia, Pa.
Cooperating group(s): Institute for Child Study of Philadelphia (sponsored by Graduate School of Medicine and Evans Institute of Dentistry of University of Pennsylvania and Children's Hospital of Philadelphia); Philadelphia Department of Public Health; Philadelphia Board of Public Education; Public Health Service, U. S. Department of Health, Education, and Welfare.

19-AA-10 GROWTH RESEARCH UNIT

Purpose: To gain insight into critical factors influencing growth patterns of all children by observing the growth and development of deviates, especially those with pathological diagnoses which have been medically documented.
Subjects: Children with congenital cardiac lesions, and children and adolescents with significant deviations of physical, neurological, and behavioral development.
Methods: Inspection, anthropometry, photography, X-ray of the left hand and wrist. Analysis of these basic data for current status and for growth trends.
Duration: 1929-1969.
Investigator(s): Leona M. Bayer, M.D., Co-chairman, Youth Clinic, Presbyterian Medical Center, San Francisco, and Adjunct Clinical Associate Professor of Medicine, Stanford University, Palo Alto, Calif.
Cooperating group(s): Institute of Medical Sciences; Service for Developmentally Handicapped Children.
Publication: Journal of Clinical Endocrinology and Metabolism, 22:1127-1129, November 1962; Journal of Pediatrics, 62:5:631-645, May 1963.

19-AA-11 LONGITUDINAL STUDY OF DENTOFACIAL, SKELETAL, PHYSICAL GROWTH AND NUTRITION OF CHILDREN

Purpose: To study the dentofacial growth of children, standards of nutrition, caries increment as related to nutrition, assessment and skeletal age as related to facial growth, variations in physique and its effect on dentofacial growth. Twins are also being studied to determine heritable traits.
Subjects: 400 children, including 40 pairs of twins, ages 3 to 18 years, who have been observed for periods of 3 to 10 years.
Methods: Cephalograms, hand, wrist, and calf X-rays, intra-oral X-rays, study casts, anthropometric measurements, photographs, oral examination, and one-week food diary. Children are examined every six months until 14 years of age.
Initiation date: 1950.
Investigator(s): Bhim S. Savara, D.M.D., M.S., Professor and Head, Child Study Clinic, University of Oregon Dental School, 611 S.W. Campus Dr., Portland 1, Oreg.
Cooperating group(s): University of Oregon Dental School; Oregon State Board of Dental Examiners; Tektronix Foundation, Inc.; Medical Research Foundation of Oregon; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Recent articles: Radiology, April 1961; July 1962. Journal of Dental Research, July-August 1961; July-August 1962. Human Biology, February and September 1962.

19-AA-12 RADIOGRAPHIC ATLASES OF SKELETAL DEVELOPMENT

Purpose: To develop radiographic standards of skeletal development for use as reference standards for children.
Subjects: 4483 Cleveland children; 134 Boston children; and a sample of Detroit children.
Methods: Series of films of hand, elbow, shoulder, hip, knee, and foot of healthy children are used to identify the modal (moderate) rate of bone development. Revisions or initial standards are prepared as needed to

provide standards of reference.
Duration: 1948-1966.
Investigator(s): S. Idell Pyle, Ph.D., Research Associate, Department of Anatomy, Western Reserve University, Cleveland, Ohio; and William Walter Greulich, Ph.D., Professor and Head, Department of Anatomy, Stanford University, Stanford, Calif.
Cooperating group(s): Bolton Study (Cleveland); Department of Maternal and Child Health, Harvard University School of Public Health.
Publication: Current standards: *Radiographic Atlas of Skeletal Development of Elbow and Shoulder*; *Radiographic Atlas of Skeletal Development of Hip*. The latest standard for the hand was published in 1959; foot in 1962; and knee in 1955.

19-AA-13 COLLABORATIVE STUDIES IN CEREBRAL PALSY AND OTHER NEUROLOGICAL AND SENSORY DISORDERS OF INFANCY AND CHILDHOOD

Purpose: To investigate factors and conditions affecting parents: (1) conditions of pregnancy itself, such as infections, trauma, bleeding, drugs, and progress of labor; (2) environmental factors influencing mother, such as social and economic conditions, emotional stress, and medical care; (3) biological factors in parents such as age, parity, medical and reproductive history, and immunologic characteristics; (4) genetic background of parents. To investigate in the offspring: disorders of the nervous system of all products of conception at time of delivery or appearing during infancy or early childhood, including cerebral palsy, mental subnormality, behavioral disorders, etc. A detailed investigation of the independent variables will be directed toward the re-evaluation of the effect of factors already suspected, the elucidation of the mechanism through which these factors are operative, and the discovery of factors neither presently known nor suspected.
Subjects: Approximately 8,000 live births per year from 15 collaborating institutions for five years. Offspring followed until school age.
Methods: Analysis of pooled information collected in a uniform way in a number of medical centers throughout the country from women studied during pregnancy and from their offspring followed throughout infancy and early childhood. Intensive study of limited number of cases; less intensive study of as many damaged children and abnormal pregnancies as possible.
Initiation date: 1956.
Investigator(s): Richard L. Masland, M.D., Coordinator of Project, National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington, D. C.
Collaborating institutions: Children's Hospital, San Francisco, Calif.; Yale University School of Medicine, New Haven, Conn.; Charity Hospital, New Orleans, La.; Johns Hopkins University School of Medicine, Baltimore, Md.; Boston Lying-In Hospital and Children's Medical Center, Boston, Mass.; University of Minnesota Medical School, Minneapolis, Minn.; Columbia-Presbyterian Medical Center and New York Medical College, New York, N. Y.; University of Buffalo, Buffalo, N. Y.; University of Oregon Medical School, Portland, Oreg.; Children's Hospital of Philadelphia and Pennsylvania Hospital, Philadelphia, Pa.; Brown University, Providence, R. I.; University of Tennessee Medical School, Memphis, Tenn.; Medical College of Virginia, Richmond, Va.
Publication: *Johns Hopkins Magazine*, June 1959.

19-AA-14 RESEARCH ON SPEECH AND LANGUAGE DISORDERS

Purpose: To investigate etiology, prevention, and rehabilitation in speech and language disorders of children with cerebral palsy, aphasia, cleft palate, endocrine disorders, mongolism, or mental deficiency.
Subjects: Study group chosen from clinical population, approximately 1,500 cases, and matched with normal controls.
Methods: Basic studies on anatomy and functional larynx, respiration, etc., including X-ray measurements and similar techniques; various other research methods (generally behavioral items) depending upon area under study.
Initiation date: 1934.
Investigator(s): Martin F. Palmer, Sc.D., Director, Institute of Logopedics, 2400 Jardine Dr., Wichita 19, Kans.
Cooperating group(s): Federally supported.
Publication: Articles appearing regularly in *Journal of Speech and Hearing Disorders*, *Journal of Speech and Hearing Research*, *Cerebral Palsy Review*, etc.

19-AA-15 METHODS IN CHARACTER DEVELOPMENT

Purpose: To develop more effective methods in character development in cooperation with character training agencies.
Subjects: Children and families in about 30 participating church schools and other groups widely spread in the United States.
Methods: Experimental use of curriculum by participants. Reports of experimental efforts analyzed and curriculum revised on basis of findings. Methods of character education then developed and reported. Emphasis is on character growth in children.
Findings: Anticipate development of instructions for writing character building curricula. These will include types of homes, children, and classes for character development and descriptions of age-level potentials for children.
Initiation date: 1936.
Investigator(s): Ernest M. Ligon, Ph.D., Director, Character Research Project, Union College and University, Schenectady, N. Y.
Cooperating group(s): Lilly Endowment, Inc.
Publication: Published in *Union College Studies in Character Research*. Also *Dimensions of Character*, Macmillan, 1956.

GROWTH AND DEVELOPMENT

General

19-BA-1 EXPERIMENTAL INVESTIGATION OF EXPLORATORY BEHAVIOR IN CHILDREN

Purpose: To investigate habituation to novelty and to complexity both of stimuli and of environments.
Subjects: Nursery school children, brain-damaged children and autistic children.
Methods: Check list and film recordings of behavior in specified stimulus conditions, i.e., in the presence of a novel object or complex object.
Findings: A monotonic decay of exploratory behavior with time in normal children, but no monotonic relationship found in autistic children.
Duration: November 1963-1966.
Investigator(s): Corinne Hutt, B.Sc., Research Psychologist, Park Hospital for Children, Headington, Oxford, England.
Publication: Paper to be read at Symposium of the London Zoological Society, November 1965; another paper in preparation.

19-BA-2 NATIONAL CHILD DEVELOPMENT STUDY (1958 COHORT)

Purpose: To follow up all children born in one week in 1958 in England, Scotland, and Wales for whom uniquely comprehensive data were collected before and during birth by Dr. N. R. Butler (published in *Perinatal Mortality Survey*, 1963). The aims are twofold: (1) to investigate present physical, educational, and psychological development of these children; and (2) to identify all those who now give concern, be it because of physical, mental or social handicaps.
Subjects: A national sample of 17,000 boys and girls, now aged seven years.
Methods: Three comprehensive questionnaires have been developed, the information to be obtained by personal interview. The first is an educational one, which includes some scholastic and psychological tests to be administered by the school--the child's present behavior and adjustment in school, educational and social progress are being investigated. Secondly, the parental questionnaire to be administered by social workers, in most cases, Health Visitors, aims at obtaining from the mother information on the child's overall progress and adjustment. Thirdly, a medical questionnaire has been prepared, to be completed following a special examination of the child.
Duration: October 1964-October 1967.
Investigator(s): N. R. Butler, M.D., M.R.C.P., D.C.H., Professor of Child Health, University of Bristol, Bristol; M. L. Kellmer Pringle, Ph.D., Director; and R. Davie, Esq., B.A., Senior Research Officer, National Bureau for Cooperation in Child Care, Adam House, 1 Fitzray Square, London W1, England.
Cooperating group(s): Institute of Child Health, University of London; National Birthday Trust Fund; National Foundation for Educational Research; National Bureau for Cooperation in Child Care.

19-BA-3 A FOLLOW-UP STUDY OF A SELECTED SAMPLE OF JUNIOR SCHOOL CHILDREN NOW AGED FIFTEEN YEARS

Purpose: To gain information on the education, social and emotional development, ambitions, and career prospects of children who had been the subjects of a longitudinal study during the ages of 7 to 11 years; secondly, to investigate whether the influence of two very different types of educational methods and organization has had any lasting influence once the children had gone to different schools.
Subjects: 81 boys and girls living in small Midland towns.
Methods: A battery of attainment tests was given; each child was individually interviewed to investigate his attitudes to his present and past schools, his leisure interests, ambitions, etc.; detailed readings and other information were obtained from teachers as well as from parents.
Duration: 1964-1965.
Investigator(s): M. L. Kellmer Pringle, Ph.D., Director, and Stanley Gooch, B.A., Senior Research Officer, National Bureau for Cooperation in Child Care, Adam House, 1 Fitzroy Square, London W1, England.
Cooperating group(s): Department of Education and Science.
Publication: Three papers are ready for publication.

19-BA-4 LONGITUDINAL STUDY OF THE ALL AROUND DEVELOPMENT OF JUNIOR SCHOOL CHILDREN

Purpose: To gain continuous and comprehensive information on educational, social and emotional development during this period; secondly, to compare the influence, if any, of two different types of educational methods and organization on children's adjustment and learning--i.e., a traditional, mainly adult-directed form emphasizing competition as against a progressive, mainly child-centered form stressing cooperation.
Subjects: 250 boys and girls, aged 7 to 11 years, living in small Midland towns.
Methods: During each of the four years, various aspects of the children's development are examined both by individual and group methods. Wherever possible, the same measures and tests are used in each of the four years. Over 100 assessments and tests are applied, ranging from attainment to personality and aptitude tests. Detailed ratings and other information are also obtained each year from the teachers, and the cooperation of the parents is also enlisted.
Findings: So far six papers have been published.
Duration: 1957-1966.
Investigator(s): M. L. Kellmer Pringle, Ph.D., Director, National Bureau for Cooperation in Child Care, Adam House, 1 Fitzroy Square, London W1, England.
Cooperating group(s): Postgraduate students in Educational Psychology, University of Birmingham; three charitable foundations.
Publication: Gegenwartsprobleme der Entwicklungspsychologie (Festschrift fur Charlotte Buhler), 104-114, 1963; British Journal of Educational Psychology 33, 1963; Journal of Child Psychology and Psychiatry 4, 1963; British Journal of Social and Clinical Psychology 3, 1964; British Journal of Educational Psychology 35, 1965.

19-BA-5 FAILURE TO THRIVE IN INFANTS

Purpose: To explore pertinent psychological and social factors that contribute to the development of the syndrome.
Subjects: Infants from underprivileged families.

Methods: Interdisciplinary clinical observations, including pediatric and psychiatric interviewing, observations by nursing personnel, home visits, and homemaker observations.
Findings: Preliminary report given at recent meeting of Pediatric Outpatient Clinics.
Duration: 1964-1967.
Investigator(s): Albert J. Solnit, M.D., Professor of Pediatrics and Psychiatry, and Martha Leonard, M.D., Assistant Professor of Pediatrics, Yale University School of Medicine, New Haven, Conn. 06510.
Cooperating group(s): Visiting Nurses Association of New Haven; Family Service of New Haven, Inc.
Publication: Publication in established scientific journals is planned.

19-BA-6 STUDY OF PREMATURES

Purpose: To investigate effect of birth weight and gestation time upon later mental development while controlling for neurological status, social class, and maternal practices.
Subjects: 992 infants born in Baltimore in 1952, 500 of whom were less than 2501 grams birth weight.
Methods: Subjects were examined at 40 weeks, 3-5 years, 6-7 years, and 9-10 years of age, collecting neurological, social history, and psychological test data. Current data collection includes academic achievement at 12 years of age.
Duration: 1952-1966.
Investigator(s): Gerald Wiener, Ph.D., Director, Study of Prematures and Associate Professor, School of Hygiene and Public Health, Johns Hopkins University, Baltimore 5, Md.
Publication: Pediatrics 34:3:434-444, March 1965. Several additional publications are planned regarding neurological, behavioral, and academic correlates of low birth weight.

19-BA-7 INFANT PSYCHOPHYSIOLOGICAL SYSTEMS

Purpose: A systematic examination of the level of activation in neonates and infants from a developmental as well as an ontogenetic point of view with emphasis upon sets of factors which produce changes in the level of activation.
Subjects: Newborn infants and progressively older infants.
Methods: Psychophysiological and behavioral measures recorded initially during nursery period, then at selected monthly intervals, with the following specific aims: (1) to delineate individual differences in the basal levels of central and autonomic nervous system activity, and to establish their patterning over time; and (2) to ascertain and evaluate the co-variations of central and autonomic nervous system activity, as a function of spontaneous behavioral activity changes, reactivity to sensory stimulation, and reactivity to conditions of minimal and moderate stress.
Investigator(s): David H. Crowell, Ph.D., Pacific Biomedical Research Center 308, Department of Psychology, University of Hawaii, Honolulu, Hawaii 96822.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-BA-8 SOME CORRELATES OF HEIGHT AND WEIGHT INCREMENTS AT EIGHT MONTHS

Purpose: To determine relationship between physical development at eight months as measured by height and weight increments, and the child's mental, fine motor, and gross motor development as measured by the Bayley scale.

Subjects: Babies tested at the Pennsylvania Hospital in Philadelphia within three days of their eight-month birthday. Subjects are drawn from those included in the NINDB Collaborative Project (see 19-AA-13); approximately 100 babies will be included.

Methods: Birth and growth measurements correlated with such factors as socio-economic status, sex, race, intelligence, fine and gross motor development, etc.

Duration: October 1964-spring 1965.

Investigator(s): Leila Padilla Otterman, Ph.D., Psychologist, Child Growth and Development Program, Children's Hospital of Philadelphia, Philadelphia, Pa.

Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: Journal publication is planned.

19-BA-9 PSYCHOBIOLOGICAL AND SOCIOCULTURAL PROCESSES OF PUBERTY AND ADOLESCENCE

Purpose: To study interrelationships of biological, psychological, and socio-cultural factors during puberty and adolescence, and the significance of these interrelationships in the pattern of maturation of the total person.

Subjects: Approximately 5,000 children, age 8, will be followed through adolescence to obtain data descriptive and normative in nature. The group, about 12% Negro, will be evenly distributed by sexes.

Methods: Three levels of investigation are planned. The descriptive-normative studies will contain data collected from the entire sample and will be continuous research programs. Factors under investigation will include measurements of anatomical, physiological and biochemical aspects of growth and development plus concomitant measures of attitudes, feelings, personality dynamics, abilities, school performance, and many other psychological and social variables. A subsample of approximately 500 is planned for more extensive investigations by individual researchers, and will provide a pool of subjects to be studied both longitudinally and cross-sectionally. The third level will involve systematic subsampling from the total pool of subjects for shorter term, in-depth investigations by individual researchers. Specific variables under investigation will be the prerogative of the investigator but will be designed in such a way that the findings can be generalized to the total sample.

Findings: A bibliography of abstracts of references to adolescence is near completion. It will contain an estimated 7000 entries gleaned from medical, psychological and sociocultural journals extending from the earliest reports through 1964.

Duration: July 1964-continuing.

Investigator(s): L. J. West, M.D., Professor and Head, and Marshall D. Schechter, M.D., Professor of Child Psychiatry, Department of Psychiatry, Neurology, and Behavioral Sciences, University of Oklahoma School of Medicine, Oklahoma City, Okla. 73105.

Cooperating group(s): Foundations Fund for Research in Psychiatry.

Publication: Plans for publication of the bibliography on adolescence have been begun and await adequate funding. Reports of pilot studies will be made available when completed. Reports of the research will be made public through journal articles and monographs.

19-BA-10 LONGITUDINAL STUDIES OF TWINS

Purpose: To determine hereditary factors in physical growth and in cognitive and personality variables.
Subjects: Approximately 100 pairs of twins seen since birth; about 200 pairs of high school-age twins (both samples still being added to).
Duration: 1959-continuing.
Investigator(s): Steven G. Vandenberg, Ph.D., Director, Child Development Unit, Department of Pediatrics, University of Louisville School of Medicine, Louisville, Ky.
Cooperating group(s): National Instutute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Papers in various scientific journals in press.

19-BA-11 DEVELOPMENT OF NEGRO AND WHITE INFANTS

Subjects: 120 full-term infants (60 Negro and 60 white), chosen by random selection from the Bureau of Vital Statistics of Tallahassee, Florida.
Methods: Subjects will be tested on the Gesell Developmental Test at 12, 24, and 60 weeks. Either the developmental quotient (D.Q.) or total number of items passed at the chronological age level being tested plus items passed at a higher age level (whichever is more definitive) will be determined for each of the four test categories and at each age level. The Mann-Whitney U test will be used to compare the Negro and white infants at each age level and on the four categories being tested. Since birth weight has been shown to be a significant factor in development, data will be analyzed by controlling weight.
Duration: January-April 1965.
Investigator(s): C. Etta Walters, Ph.D., Associate Professor, Institute of Human Development, Florida State University, Tallahassee, Fla.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-BA-12 ELECTROENCEPHALOGRAPHIC STUDIES IN NEWBORN AND YOUNG INFANTS

Purpose: Specific aims are the maturation appraisal of newborns by electroencephalographic methods and correlation with subsequent physical and mental development, under normal and abnormal conditions.
Subjects: Neonates drawn from NINDB Collaborative Project (see 19-AA-13) plus prematures and infants of multiple births, born at University of Oregon Medical School.
Methods: Newborn electroencephalography, including latency measurements in response to photic and acoustic stimulation. A Computer of Average Transients is used to measure the latency periods at different conceptual ages. Follow-up by electroencephalographic methods and psychological testing at age eight months, four years, and seven years.
Findings: In premature infants the evoked responses in the occipital area appeared with considerably longer latency than seen in normal, full-term infants. Post-mature infants tended to have shorter latency periods. Many prematurely born infants failed to show the shorter response latency found in full-term infants when they reached a conceptual age of 39 or 40 weeks. Female neonates showed a slight, but significantly shorter latency period than males. There was a consistent difference between white and Negro infants. Negro infants showed a greater responsiveness as expressed by photic latency measurements shortly after birth.

Duration: January 1961-December 1966.
Investigator(s): Rudolf C. H. Engel, M.D., M.Sc., Associate Professor of Pediatrics, University of Oregon Medical School, Portland 1, Oreg.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: "Maturational Changes and Abnormalities in the Newborn Electroencephalogram," *Developmental Medicine and Child Neurology*, August 1965.

19-BA-13 ADULT HEALTH RELATED TO CHILD HEALTH AND DEVELOPMENT

Purpose: To determine extent to which certain characteristics of young adults, around age 30, can be predicted from a knowledge of their patterns of health and development during childhood.
Subjects: 134 individuals who were enrolled in the Longitudinal Study of Child Health and Development conducted by Dr. Harold C. Stuart at the Harvard School of Public Health. These individuals were followed periodically from birth to 18 years and have reached the age period of 25 to 34 years.
Methods: Investigation of current medical examination data, health histories, and social data in relation to detailed longitudinal data.
Duration: June 1964-May 1968.
Investigator(s): Isabelle Valadian, M.D., Assistant Professor of Maternal and Child Health, and Robert B. Reed, Ph.D., Professor and Head, Department of Biostatistics, School of Public Health, Harvard University, 55 Shattuck St., Boston 15, Mass.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publications planned in 1968.

19-BA-14 A TEN-YEAR FOLLOW-UP OF LOW BIRTH WEIGHT INFANTS

Purpose: To assess the adjustment of low birth weight infants at 10 years of age with reference to: (1) school performance and special abilities (e.g., music), with confirmation by intelligence testing; (2) home environment and social contacts; and (3) athletic pursuits. Minor purposes include study of causation of premature delivery and disease susceptibility in low birth weight children.
Subjects: 45 infants of birth weight 2,500 grams or less, born at University Hospital, Edmonton in 1953-1954.
Methods: Study of various parameters of intelligence and developmental quotients (norms for school children in city already known for all ages); socio-economic and educational history obtained from parents; complete medical history of mother and child; genetic history; complete physical examination of child with measurements and photographs.
Findings: Tentative--(1) I.Q's and D.Q's of low birth weight infants not significantly different from norms; (2) all 45 children in appropriate school grade; (3) parental drive and economic well-being are a potent force for full development of child; and (4) major physical anomaly is myopia.
Duration: January-November 1964.
Investigator(s): David Bell, B.A. (Ed.), Post Graduate Student, Faculty of Education; W. C. Taylor, M.B., Ch.B., F.R.C.P.(C), Associate Professor of Pediatrics, and E. Salter, M.D., Resident in Pediatrics, University of Alberta, Edmonton, Alta.
Publication: Publication is planned.

19-BA-15 EFFECTS OF HANDLING ON THE PHYSICAL AND BEHAVIORAL DEVELOPMENT OF PREMATURE INFANTS

Purpose: To investigate effects of handling, beyond that which is typical in the care of prematures, on a variety of behavioral and developmental indices. The dependent variables to be studied are activity, weight, temperature, response to startle, feeding behavior, sucking behavior, and frequency of urination and defecation.
Subjects: Twenty white premature infants, 10 boys and 10 girls, each having a birth weight between 1190 and 1590 grams and a gestational age of less than 37 weeks.
Methods: The control Ss (5 boys and 5 girls) will be treated in manner customarily employed in the care of premature infants. Handling of these infants will take place at three-hour intervals and only in association with the feeding process. Each experimental S (5 boys and 5 girls) will be handled in his isolette for five minutes each hour during a 24-hour day, for a period of 10 days. With the same methods used to produce a burp, nurses assigned to the project will accomplish the handling through gentle rubbing of the infant's back, neck and arms. After the 10-day experimental period, and until discharge from the nursery, infants in the experimental group will be treated in the same manner as were the control infants.
Duration: July-October 1965 (pilot phase).
Investigator(s): Norman Solkoff, Ph.D., Assistant Professor of Psychology, Department of Psychiatry; David M. Weintraub, M.D., Assistant Clinical Professor of Pediatrics; and Sumner Yaffe, M.D., Associate Professor of Pediatrics, State University of New York at Buffalo, Buffalo, N. Y. (Reported by S. Mouchly Small, M.D., Professor and Chairman, Department of Psychiatry, State University of New York at Buffalo.)
Cooperating group(s): Childrens Hospital, Buffalo.
Publication: It is expected that some aspect of this pilot work will be published in either *Child Development* or *Pediatrics*.

19-BA-16 PHYSICAL, SOCIAL, AND EMOTIONAL DISORDERS FOLLOWING FAILURE TO THRIVE

Purpose: Growth failure in children, known as the failure-to-thrive syndrome, is a disorder of multiple etiology defined by marked retardation of growth in height and weight. A study was conducted on a group of children with growth retardation and failure to thrive associated with maternal deprivation and disturbance in the mother-child relationship. Purpose was to determine: (1) sequelae--physical, emotional, and social--that follow the acute phase of this disorder; (2) associations existing between these sequelae, external family stresses, and maternal characteristics at the time of full development of the syndrome; and (3) gaps in current management of the disorder.
Subjects: From a survey of hospital records of children admitted to the Boston Children's Hospital Medical Center between 1958 and 1964, 40 cases of failure to thrive not due to organic pathology were selected for study.
Methods: Medical records were reviewed to obtain all relevant medical, social, and psychological data. Social agencies were contacted to determine effectiveness of medical and social service recommendations at time of discharge, and to assess subsequent family adjustment. Direct patient and family material was obtained during follow-up visits to the Child Development Clinic and through home visits. Data were analyzed both quantitatively and qualitatively.
Findings: Significant physical, psychological, and social disorders followed the acute phase of this syndrome. These included marked retardation of physical growth and development, evidence of intellectual impairment, early disorder of character development, and family social disintegration. Mothers of these children represented a wide spectrum of psychological

disorders, and could not easily be described by a single formulation. The critical issue of decision-making in management and placement of these children demands: (1) establishment of more stringent medical and social diagnostic criteria; (2) more decisive action by social agencies; (3) wider interpretation of existing laws related to child care and protection; and (4) development of more realistic cultural attitudes regarding rights of infants and children.
Investigator(s): Helen H. Glaser, M.D.; Dexter M. Bullard, Jr., M.D.; Elizabeth C. Pivchek, M.S.W.; and Margaret Heagarty, M.D., Children's Hospital Medical Center, Boston, Mass.

19-BA-17 THE WORLD OF THE INFANT WHO FAILS TO GROW

Purpose: To study: (1) infants who are grossly undernourished and underweight but have no physical or physiological abnormalities; (2) emotional, developmental, and intellectual level of these infants and their course in the hospital; (3) family constellation in which these infants live (including the physical environment, the mother or mother surrogate, the father if present, and other significant adults and children in the home); and (4) nature of the community, various agencies in the community, and conditions that allow an infant to arrive at this state.
Subjects: Infants and young children whose weight is markedly below that expected for their chronological age. All physical and laboratory studies are negative as to the cause of the low weight. These subjects frequently show marked improvement when hospitalized over a period of time.
Methods: Detailed and extensive exploration of each family and child through home interviews, psychiatric social work investigation, psychological and psychiatric examination of subjects and their families, and examination of hospital and community agency records.
Duration: 1964-continuing.
Investigator(s): Joseph Fischhoff, M.D., Assistant Professor of Child Psychiatry, School of Medicine, Wayne State University, and Attending Physician, Children's Hospital of Michigan; David Faigenbaum, Ph.D., Assistant Professor, Departments of Pediatrics and Psychology, Wayne State University; and Harold Weiss, M.S.W., Psychiatric Social Worker, Children's Hospital of Michigan, Detroit, Mich.
Cooperating group(s): Community agencies and resources in the Detroit metropolitan area.

19-BA-18 CONTROLLED TEN-YEAR FOLLOW-UP STUDY OF SMALL PREMATURES

Subjects: All surviving prematures born at the Chicago Lying-In Hospital with weights of less than 1500 grams are being traced and re-examined 10 years after delivery. Paired term control infants matched with respect to sex, race, date of conception, route of delivery, primigravidity, multiplicity of birth, and socio-economic status are being examined in identical fashion.
Methods: Examinations include physical, neurological, audiometric, ophthalmologic, psychometric, and social evaluation. If statistically significant differences in the degree of handicapping are found, a search for correlating antenatal, paranatal, and postnatal factors will be made.
Investigator(s): Francis Howell Wright, M.D., Professor of Pediatrics; Robert Y. Moore, Assistant Professor of Medicine; and Ralph Naunton, Associate Professor of Otolaryngology, School of Medicine, University of Chicago, 950 E. 59th St., Chicago, Ill.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

Physical

19-BD-1 EVALUATION OF PHYSICAL FITNESS LEVELS OF CHILDREN

Subjects: 425 students and 67 adults from Oklahoma City, Oklahoma and Searcy and Bald Knob, Arkansas, tested during period September 1, 1962 through December 31, 1963.
Methods: (1) Extensive physical examination; (2) measurement of maximum working capacity on a treadmill, incorporating before and after blood analyses, analysis of expired air and other cardiovascular measures, and continuous measures of pulse rate, blood pressure, ventilation, and performance of heart muscle; and (3) administration of test described by American Association for Health, Physical Education, and Recreation in its *Youth Fitness Test Manual*. Percentile scores from this test are ranked against national norm and results compared with the scientific evaluation.
Duration: September 1962-July 1966.
Investigator(s): Robert T. Clark, Ph.D., Vice President for Research; Clark Stevens, Ph.D., Professor of Biology; Harry D. Olree, Ed.D., Professor and Chairman, Department of Health and Physical Education, Harding College, Searcy, Ark.; and Harris D. Riley, Jr., M.D., Professor and Chairman, Department of Pediatrics, School of Medicine, University of Oklahoma, Oklahoma City, Okla.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-BD-2 CLINICAL AND EXPERIMENTAL STUDIES OF HUMAN OBESITY

Purpose: To study effect upon obese and anorexic persons of their experience of "hunger" and the effectiveness of their regulation of food intake; also to follow up previous findings, discordant with most others in the literature, that obese preadolescent girls in a summer camp are just as active as nonobese girls.
Subjects: Obese preadolescent girls, with matched nonobese controls, from an unselected school population.
Methods: Techniques which have been developed to teach persons to become aware of their gastric motility will be applied to subjects. Mechanical pedometers will be used to compare physical activity of subjects with that of controls.
Duration: 1965-1970.
Investigator(s): Albert J. Stunkard, M.D., Professor of Psychiatry, and Mary E. Moore, Ph.D., Associate in Psychology in Psychiatry, School of Medicine, University of Pennsylvania, Philadelphia, Pa. 19104.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-BD-3 TASTE DISCRIMINATION IN CHILDREN

Purpose: Taste abilities of children are measured to formulate a theoretical approach to taste, and to compare to that of electrophysiology with animals.
Subjects: Children between the ages of 4 and 14.

Methods: Absolute threshold and just noticeable differences will be measured by three different methods commonly employed in the literature.
Duration: September 1963-December 1966.
Investigator(s): Lloyd M. Beidler, Ph.D., Professor of Physiology, Department of Biological Sciences, Florida State University, Tallahassee, Fla.
Cooperating group(s): National Science Foundation.
Publication: Publication will be made in a suitable journal in 1966.

19-BD-4 A SURVEY AND COMPARISON OF YOUTH FITNESS BETWEEN 1957 AND 1963

Purpose: To determine the present level of fitness of boys and girls based on a national sample.
Subjects: Approximately 9,000 boys and girls in grades 5 through 12 in public schools of the United States.
Methods: Administration of seven-item physical fitness test.
Duration: January 1964-November 1965.
Investigator(s): Paul A. Hunsicker, Ph.D., Chairman, Department of Physical Education, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Report to be submitted to U. S. Office of Education; test data to be published by the American Association for Health, Physical Education and Recreation.

19-BD-5 THE SCRATCH OF THE NEWBORN

Purpose: To correlate neonatal scratching with paranatal history and yearly follow-ups including behavioral adjustment and psychosomatic disease.
Subjects: 28 neonates who scratched self; 28 neonates who did not.
Methods: Observation at day one and two; paranatal history; annual follow-ups; physical exam at one year; psychiatric evaluation at five years; I.Q. and other tests at five years.
Duration: 1962-1970.
Investigator(s): C. E. Schorer, M.D., Staff Psychiatrist, Lafayette Clinic, 951 E. Lafayette, Detroit, Mich. 48207.

19-BD-6 STUDY OF LATENCY TIMES AND CHARACTERISTICS OF EVOKED CRY RESPONSES IN INFANTS

Purpose: To determine if the latency time and physical characteristics of evoked cry responses in early infancy can be a useful indicator of neurological function and subsequent development.
Methods: Methods are being developed for harmless electrical and tactile stimulation, tape recording of evoked cry responses and conversion of responses to visual graphic records. The latency determinations and analysis of cry characteristics will be made from the graphic records.
Duration: April 1965-continuing.
Investigator(s): Richard J. Schain, M.D., Associate Research Professor and Research Scientist in Pediatric Neurology; and John H. Wiley, Ph.D., Associate Professor of Speech Pathology and Chief of Communicative Disorders Division, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr. 68105.

19-BD-7 RELATIONSHIPS BETWEEN EARLY GESELL DEVELOPMENTAL SCHEDULE QUOTIENTS AND LATER PERCEPTUAL-MOTOR PERFORMANCE

Purpose: To determine degree and nature of relationship between scores made by children in infancy and early childhood on the Gesell Developmental Schedules and the scores made by the same children at ages four to eight years on tests of perceptual-motor function.
Subjects: 92 children who had been administered the Gesell Schedule at a mean age of 57 weeks.
Methods: At a mean age of 70 months, subjects were administered a battery of tests of visual, tactile, and kinesthetic perception and motor planning and execution. Resultant scores were compared with early developmental quotients by computing Pearson product-moment correlations. Significance of difference between mean perceptual scores of children scoring above versus below the mean on the Gesell test was tested with t- ratios.
Findings: All perceptual-motor tests significantly discriminated between the high and low developmental quotient groups. All correlations between individual perceptual-motor tests and the Gesell quotients were significant, most of them being in the .40's and .50's. Using stepwise multiple regression, an R of .75 was obtained between the total test battery and the Gesell scores.
Duration: August 1964-August 1965.
Investigator(s): A. Jean Ayres, Ph.D., Post-doctoral Trainee; Arthur H. Parmelee, Jr., M.D., Department of Pediatrics, University of California; and Miriam C. Wilson, M.D., Crippled Children's Services of Los Angeles County, Los Angeles, Calif.
Publication: Publication is planned.

19-BD-8 PHYSICAL GROWTH AND DEVELOPMENT IN JAPANESE-BRAZILIAN CHILDREN

Purpose: Comparison of growth of Brazilian children of Japanese parents with that of Japanese children in Japan considering: health status, changing food habits, nutrition, economic level, and climate, in order to weigh the value of biological, ecological, and socio-cultural factors upon growth.
Subjects: Japanese-Brazilian children, ages 6 to 12 years, in the State of Sao Paulo, Brazil of Japanese parents; a smaller sample of children with only one Japanese parent.
Methods: Medical and dental examinations, laboratory analysis of blood and stools, nutritional analysis of diets, sociological questionnaires of family life and food habits, anthropometry, eruption of permanent dentition, menarche. Growth treated cross-sectionally and longitudinally for stature, weight, and sitting height.
Findings: Preliminary findings indicate slight advantage in height of Brazilian-born Japanese, greater length of lower limbs compared to total height of Brazilian-born Japanese, and that California-born Japanese studied by Greulich (*American Journal of Physiology and Anthropology* 15:489-516, 1957) are larger and heavier than Brazilian-born Japanese.
Duration: 1962-1967.
Investigator(s): Irma M. Amelia Guaraciaba, Chairman, Department of Anthropology and Biology, Fac. de Filosofia, Ciencas, e Letras, S. Coracao de Jesus Bauru, Sao Paulo, Brazil.
Cooperating group(s): Fundacao de Amparo a Pesquisa de Estado de Sao Paulo.
Publication: Two articles in press in the *Anais do Museu Paulista* and *Educacao e Ciencas Sociais*; report of health to be published in the *Revista Paulista de Medicina*--all in Portuguese.

19-BD-9 AGE AND SEX DIFFERENCES IN PERCEPTUAL LATERALITY

Purpose: To assess the effects of age, sex, and handedness on certain laterality effects in perceptual tasks.
Subjects: Left- and right-handed male and female subjects, between the ages of 8 and 21 years.
Methods: Subjects will be tested for lateral differences in a visual perceptual task. In addition, older subjects will be tested for analogous differences in a dichotic listening situation. Visual data will be the frequency of fragmentation of low intensity stimuli in the left and right visual field. Auditory data will be the percentage of digits correctly perceived from the left vs. right ear, when the digits to the two ears are presented simultaneously. These data will be analyzed to reveal any relation between laterality effects in the two perceptual areas, as well as their relation to handedness. Further, any concordance between visual, auditory, and motor aspects of laterality will be analyzed for its relation to age and sex.
Duration: 1964-1965.
Investigator(s): John Paul McKinney, Ph.D., Assistant Professor, Department of Psychology, Smith College, Northampton, Mass.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-BD-10 RELATIONSHIPS BETWEEN PHYSICAL PERFORMANCE OF SCHOOL-AGE CHILDREN AND THEIR AGES, HEIGHTS, AND WEIGHTS

Purpose: To determine the suitability of nonlinear functions for expressing relationships between the physical performance of school-age children on the AAHPER Youth Fitness Test and the children's ages, heights, and weights; to develop a multiple, nonlinear, regression of physical performance scores on the independent variates of age, height, and weight; to prepare, from the coefficients of the multiple, nonlinear regressions, a new Classification Index in tabular or graphic form, for use in evaluating pupils' performances on the AAHPER Youth Fitness Test; and to determine the feasibility of combining the item scores on the test into a composite score which would represent the relative, overall fitness of a school youth.
Subjects: 28,000 school children in grades 4 through 12, enrolled in 100 school districts randomly selected from the 450 Minnesota graded elementary and secondary public school systems.
Methods: Develop hypotheses concerning the nature of the relationships through graphic analysis; test derived hypotheses by comparing the effectiveness of any resulting nonlinear regression equations with that of linear equations using the least-squares technique; derive new Classification Indices from the regression coefficients of any significantly superior nonlinear regression equation; develop tabular and/or graphic methods for interpreting children's performances on the AAHPER Test; and analyze distributions of various composite scores developed for the AAHPER Test.
Findings: The standards or norms by which pupil performances scores on the AAHPER Youth Fitness Test are evaluated should take into account the age, height, and weight of the pupils. Norm tables for the five physical performances were prepared using the most effective multiple nonlinear regression equations. It was possible to develop a composite score in which the scores of the five performances were combined. A computer program for scoring and interpreting pupil performances scores on the AAHPER Youth Fitness Test was devised.
Duration: November 1962-August 1965.
Investigator(s): John E. Bicknell, Director of Research; Carl Knutson, Director of Physical Education, Minnesota State Department of Education, St. Paul; Marjorie Wilson, Professor of Physical Education, University of

Minnesota, Minneapolis; and Clem W. Thompson, Ph.D., Professor of Physical Education, Mankato State College, Mankato, Minn.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-BD-11 BEHAVIORAL OBSERVATIONS ON HYPERKINETIC AND NORMAL CHILDREN

Purpose: A pilot study to evaluate effect of environmental stimulation on behavior; to differentiate between two types of hyperkinetic children--those who are hyper-responsive to environmental cues and those who appear to be "internally driven;" and to see if these two types of disturbances respond differentially to pharmacotherapy.
Subjects: 12 to 20 children diagnosed as hyperkinetic and in the 7 to 9 year age range; 12 to 20 normal controls.
Methods: Behavioral observations of children will be made under a number of experimental conditions. The major variable will be their performance on simple tasks with an observer present or by themselves. Observations are recorded on an event recorder.
Duration: July-September 1965.
Investigator(s): John A. Stern, Ph.D., Professor, and M. A. Steward, M.D., Assistant Professor, Department of Psychiatry, Washington University School of Medicine, St. Louis, Mo. 63104.

19-BD-12 A DEVELOPMENTAL STUDY OF PERCEPTUAL, CONCEPTUAL, MOTIVATIONAL, AND SELF-CONCEPT DIFFERENCES BETWEEN AND WITHIN HYPERACTIVE AND NORMAL GROUPS OF PREADOLESCENT BOYS

Purpose: To ascertain factors which characterize preadolescent boys seen as hyperactive by their teachers, when compared to nonhyperactive controls; to develop methods for educationally meaningful subclassification of these hyperactive boys; to provide the basis for a longitudinal study; and to develop procedures which suggest special educational programs based on learning deficits and assets rather than etiological or diagnostic labels.
Subjects: 270 boys in grades 1 through 5 of the Kingston, N. Y. school system, half of whom have been rated by their teachers as exceptionally hyperactive, distractible, impulsive, unpredictable and explosive.
Methods: Experimental and control groups will be compared on a large battery of tests including the WISC, the ITPA, the Indiana Neuropsychiatric Test Battery (after Halstead, Reitan and Reed), the Colvin Test of Self-Concept and Interpersonal Relations, two visual illusions, the SAET, two reversible figures, figure drawings, the Bender-Gestalt, and the Impulse Control Spiral. In addition, teachers' rankings and achievement test data will be procured from the school. Data analysis will include factor analysis, analysis of variance, and discriminant function analysis.
Duration: January 1965-December 1966.
Investigator(s): Raphael F. Simches, M.A., Chief, Bureau for Physically Handicapped Children, New York State Department of Education, Albany 1, N. Y. (Reported by Frank E. Clarkson, Ph.D., New York State Board of Regents Research Unit, School No. 5 Wynkoop Place, Kingston, N. Y.)
Cooperating group(s): Astor Home for Children; Kingston, New York School System; Board of Regents, N. Y. State Department of Education; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: A limited number of journal articles are planned, in addition to a final progress report.

19-BD-13 PHYSIOLOGIC STATES IN THE NEONATAL PERIOD

Subjects: Normal and abnormal babies (the latter group including both babies with depression of the functions of the central nervous system and those with convulsions or hyperactivity in response to mild stimuli) will be studied during the first five days of life, or through later age if abnormal.
Methods: Studies include 24-hour recordings of the baby's spontaneous activity on a specially constructed recording bed which will give a record of, not only the total amount of activity, but its distribution in time, including any tendencies to cyclic activity. Activity evoked by light, touch, and sound will also be recorded and the evoked potentials in EEG will be studied in response to the same stimuli. Infants will be examined neurologically by standard methods according to current practice, including some developed by the principal investigator. Possible chemical correlation, including the levels of glucose, calcium, phosphorus in the blood and transaminase in the cerebrospinal fluid will be checked. It is planned to re-examine abnormal infants at yearly intervals to determine their subsequent status, and psychometric testing will ultimately be carried out as well. Subsequent status of presumed normal newborns will also be verified either by report of a pediatrician of known competence or by re-examination by one of the project staff.
Investigator(s): Richmond S. Paine, M.D., Neurologist; Gerald Fenichel, M.D., Associate Neurologist; Marion Miles, M.R.C.P.E., Research Fellow in Neurology, Department of Neurology and Neurosurgery, Children's Hospital of D. C.; Artemis Simopoulos, M.D., Assistant Professor of Pediatrics, George Washington University School of Medicine, Washington, D. C.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-BD-14 THE DEVELOPMENT OF THE CONTROL OF ACCOMMODATION

Purpose: To determine at what age level competence in the control of focus of the eye is obtained.
Subjects: School children and young adults in Bloomington, Indiana.
Methods: Special equipment has had to be built and tested, using infrared light for monitoring accommodation.
Findings: No results as yet on children. Young adults show varying sophistication in control of focus, but in general, the control is poor.
Duration: 1958-1965.
Investigator(s): Merrill J. Allen, Ph.D., Professor of Optometry, Indiana University, Bloomington, Ind.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: American Journal of Optometry 37:8:403-407, August 1960.

19-BD-15 FEEDBACK OF INFANT'S BABY BABBLE

Purpose: To determine if infants vocalize more if stimulated by a delayed feedback of their own vocalizations.
Subjects: 20 infants, 8 to 11 months, either male or female; and 20 children, 14 months, male or female.
Methods: A Bell Telephone Delay Unit and an Ampex 620 Amplifier Speaker System are employed to record fifteen minutes of undelayed vocalizations

and fifteen minutes of delayed vocalization. Duration of vocalizations for each condition will be measured on the power level recorder. Findings: Subjective observation suggests that babies respond to feedback of their own vocalizations by an increase in the duration of their vocalizations. Female babies may vocalize more at an earlier age. Investigator(s): Sheila Morrison Goff, Associate Professor of Speech, Ohio State University, Columbus, Ohio 43210.

19-BG-1 NUTRITIONAL STATUS OF PRESCHOOL CHILDREN IN HUAY KWANG

Subjects: Mothers and their children in Huay Kwang Government Housing Project, Bangkok.
Methods: Physical examination of the preschool children as well as biochemical analysis of blood and urine.
Duration: November 1964-1965.
Investigator(s): Srisomang Keovichit, M.D., M.P.H., M.S., Lecturer, Faculty of Public Health, University of Medical Sciences, Bangkok, Thailand.
Cooperating group(s): Department of Nutrition and Department of Biostatistics, University of Medical Sciences.

19-BJ-1 A STUDY OF VARIOUS TREATMENTS OF THUMB AND FINGER SUCKING AND THEIR PSYCHOLOGICAL AND DENTAL EFFECTS

Purpose: To evaluate the dental crib as a treatment for the thumbsucking habit, and to determine if other treatments (both dental and psychological) can break the habit. Also to determine whether there is any personality or family background characteristic contributing to the thumbsucking habit.
Subjects: 66 children between the ages of 4 and 12 who have sucked their thumbs to the extent that they have affected their oral structures.
Methods: Sample was randomly divided into 6 treatment groups and treated for one year. Psychological treatment was of a supportive nature such as a dentist could perform in his office.
Findings: The palatal crib was significantly superior to all other treatments in breaking the habit.
Duration: May 1964-March 1967.
Investigator(s): R. D. Haryett, D.D.S., Sc.D., Associate Professor and Head, Department of Orthodontics, University of Alberta, Edmonton, Alta. (Reported by Mark L. Sandilands, Department of Psychology, University of Alberta.)
Cooperating group(s): Department of National Health and Welfare of Canada.
Publication: To be submitted to Canadian Dental Journal.

19-BM-1 MOTOR OVERFLOW PHENOMENA IN NORMAL AND BRAIN-INJURED CHILDREN

Purpose: To determine developmental patterns of motor inhibition, and to evaluate patterns in children with cerebral dysfunction.
Subjects: 40 normal and brain-injured children in each yearly age group from 6 to 14 years.
Methods: Formally recording observations on contralateral overflow and inhibitions when subject is asked to imitate rapid alternating movements of fingers, arms, and legs or to press dynamometer at specific pressure range. Standard checks for inter- and intra-observer reliability.
Duration: March-December 1965.

Investigator(s): Lawrence T. Taft, M.D., Associate Professor of Pediatrics and Rehabilitation Medicine, Albert Einstein College of Medicine, Yeshiva University, Bronx 61, N. Y.
Publication: To be submitted to Journal of Developmental Medicine and Child Neurology.

19-BM-2 RESPONSE SPEED AS A FUNCTION OF AGE, INCENTIVE VALUE, AND REINFORCEMENT SCHEDULE

Purpose: To take a theory of frustration, developed to explain the behavior of rats in runways, beyond its initial and boundary conditions and see the extent to which it can account for the behavior of more complex organisms. Composition laws will be added to the theory if, and when, necessary.
Subjects: One study employed 100 kindergarten children. A second study used 36 preschool and 36 kindergarten subjects.
Methods: Instrumental lever pulling response with measures of starting and movement time.
Findings: Subjects on a 50% reinforcement schedule demonstrate faster response speeds than subjects continually reinforced (100%). There was evidence on one of the measures that the superiority of the partially reinforced group develops more slowly in younger subjects. The incentive value variable yielded unexpected results in that faster speeds were portrayed by the low rather than high incentive subjects.
Duration: 1963-1965.
Investigator(s): Thomas J. Ryan, Ph.D., Assistant Professor of Psychology, University of Western Ontario, London, Ont.
Cooperating group(s): University of Western Ontario; London Board of Education; London Preschool Association.

Perceptual

19-BP-1 JUDGMENT DRIFT AS A FUNCTION OF AGE AND I.Q.

Purpose: To determine the effect of repeated estimates on children's reproductions of time intervals and drawn lines.
Subjects: A total of 64 subjects, 8 males and 8 females in each of grades 2, 4, 6, and 8, will be used.
Methods: Each child will be asked to give 10 successive reproductions of a five-second interval and 10 successive reproductions of a three-inch line. The data will be analyzed to determine whether children, like adults, show a tendency to make longer and longer reproductions on successive trials (judgment drift) and whether, controlling for I.Q., a developmental trend appears within this age range.
Duration: October 1964-June 1965.
Investigator(s): Helen White, Ph.D., Senior Research Associate, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)
Publication: Data will be included in a symposium presentation on Human Time Structure given at the 1965 American Psychological Association meetings and also published in full, possibly in Perceptual and Motor Skills.

19-BP-2 PERCEPTUAL DEVELOPMENT IV: ONTOGENETIC INFLUENCE ON THE EFFECT OF FIXATION UPON PERCEIVED DISTANCE

Purpose: To account for the developmental growth of overconstancy of distance judgments within the framework of sensorytonic theory.
Subjects: 48 pupils of a public school, aged 7 to 10 years, in groups of 12 at each age level. All have 20/20 uncorrected vision as measured on a Cohen Chart.
Methods: A modified Howard-Dolman apparatus is attached to a binocular viewing box with a black, enclosed viewing tunnel. A fixation dot is between the two rods at a distance of two meters from the eyes. The subject adjusts the right hand rod so that it appears to be at the same distance as the left hand rod. Subject then fixates the dot for 60 seconds with only the latter rod in view. Immediately following fixation subject again adjusts the right hand rod. The pretest and post-test difference is taken as after-effect of fixation.
Duration: February 1964-December 1965.
Investigator(s): Robert H. Pollack, Ph.D., Deputy Director of Research, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication is planned.

19-BP-3 THE ASSESSMENT OF SHAPE PREFERENCES IN HUMAN INFANTS

Purpose: To determine, by the use of the method of preference as indicated by time of visual fixation, the specific dimensions underlying shape preferences in young human infants as well as the preferential ordering (and discrimination) of colors; and to investigate the relative dominance of shape or color as reflected in the preferential ordering of responses to stimuli varying in both characteristics.
Subjects: Groups of four-month old infants.
Methods: Each of several groups of subjects will view a different stimulus series, the stimuli being presented according to method of pair comparisons. Stimuli of a given set will vary in some aspect of shape or color or in both dimensions. Direct observation and immediate recording of responses will be used with suitable procedural controls.
Investigator(s): William C. Spears, Ph.D., Assistant Professor of Psychology, Queen's University, Kingston, Ont.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-BP-4 PSYCHOPHYSICS OF THE DEVELOPMENT OF FORM PERCEPTION

Purpose: Application of multidimensional psychophysics to the ontogenetic development of form perception and perceptual classification of complex stimuli. Attempt will be made to specify systematic developmental changes in use of different stimulus dimensions to achieve form perception.
Subjects: Human subjects, beginning at age 2.
Methods: Psychophysics: absolute judgments and method of the standard. Use of long series of stimuli systematically varying along several dimensions. Task: classify stimuli under two mutually exclusive categories, i.e., complex and simple. Data analyzed partly by Linear Discrim-

inant Function.
Findings: Few systematic differences with age. Between ages 6 and 15, perceptual system appears remarkably stable.
Duration: June 1965-June 1968.
Investigator(s): Albert S. Rodwan, Ph.D., Assistant Professor of Psychology, and Bernhard Kempler, Ph.D., Assistant Professor, Emory University, Atlanta 22, Ga.
Cooperating group(s): Various public school systems in the Atlanta area; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Paper read at Southeastern Psychological Association Convention, Atlanta, 1965. Other reports to be published in psychological journals.

19-BP-5 PERCEPTION OF MOVEMENT BY INFANTS

Purpose: To obtain data on infants' visual fixation preferences for checkerboard stimuli varying in speed of movement and in complexity.
Subjects: Infants between 7 and 24 weeks of age, voluntarily brought to laboratory by their parents.
Methods: Subject is shown two identical checkerboard stimuli, one stationary and one which moves at speeds varying from .4 inches per sec. to 2.5 inches per sec. on different trials. Record is kept of the infant's looking time for each stimulus. Size of squares in checkerboards is also varied, and each level of complexity thus constituted is shown at the different speeds.
Findings: All age groups (7, 11, 16, 20, and 24 weeks) increase looking time with increased speed of movement. The slowest speed responded to is slower with older age groups. Complexity of stimulus affects results, but in ways not completely specified yet.
Duration: April 1963-1966.
Investigator(s): Elinor Wardwell Ames, Ph.D., Assistant Professor of Psychology, Simon Fraser University, Burnaby, B. C.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal publication planned later. Data will first be available through Silfen, Carole K., Ph.D. thesis, McMaster University, 1966.

19-BP-6 CHILDREN'S PERCEPTUAL DISCRIMINATION IN THE COLOR AND FORM DIMENSIONS

Purpose: To test the perceptual abilities of children.
Subjects: 6- and 10-year old normal children.
Methods: Oddity and matrix problems in the color and form dimensions.
Duration: January 1965-January 1967.
Investigator(s): Rosslyn Gaines Suchman, Ph.D., Associate Research Professor, Office of Psychological Research, Gallaudet College, Washington, D. C. 20002.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Communication

19-BU-1 ON PERCEPTION OF NONVERBAL PROPERTIES OF SPEECH

Purpose: It is quite possible that members of "disturbed" families learn idiosyncratic meaning attached to the nonverbal properties of speech at the cost of conventional meaning. The present study is a pilot investigation to establish a normative tool for the measurement of nonverbal properties of speech; and to make developmental comparisons.
Subjects: Four groups of children, ages 8, 10, 12, and 18.
Methods: One word ("please") will be tape recorded with many different connotations. Norms for these connotations will be established by judges on an objective basis (multiple choice scales). "Correctly" identified items on the test present normative conventional interpretation. Test will be presented to subjects, and differences in abilities to interpret nonverbal properties of language will be analyzed. Additionally the test will be presented to "disturbed" individuals and family groups to assess if such a normative tool would identify disturbances in communication. Both encoding and decoding processes will be studied.
Investigator(s): Ernst G. Beier, Ph.D., Professor of Psychology, University of Utah, Salt Lake City, Utah.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-BU-2 VERBAL COMMUNICATION PROCESSES IN CHILDREN

Purpose: To develop methods for studying, and to investigate the development of linguistic and metalinguistic communication skills.
Subjects: 26 nursery school students, ages 33-63 months, and 156 grammar school students, grades kindergarten-ninth.
Methods: A game is employed which requires that pairs of subjects communicate about a set of novel referents (ambiguous graphic designs). It allows assessment of subject's behavior as speaker or listener or as member of dyad. Data is obtained from a content analysis of verbatim transcripts.
Findings: Nursery school children are unable to develop a standardized interpersonal nomenclature for novel referents, although they can communicate adequately about nominate objects, can receive adult messages and encode intrapersonally.
Duration: December 1964-not reported.
Investigator(s): Robert M. Krauss, Ph.D., Bell Telephone Laboratories, Murray Hill; and Sam Glucksberg, Ph.D., Assistant Professor, Princeton University, Princeton, N. J.
Publication: Submitted to Child Development; paper prepared to be read in symposium at 1965 American Psychological Association meetings.

19-BU-3 THE DEVELOPMENT OF LANGUAGE FUNCTIONS

Purpose: To study the acquisition of language during childhood and changes during the entire life span; and to study cognitive aspects of language development.
Subjects: Various samples of children and adults.
Methods: Experimental techniques, discrimination tasks, recognition tasks,

concept formation tasks, word associations, speech samples, performance tasks, computers, and computers for simulation purposes.
Duration: January 1965-August 1968.
Investigator(s): Klaus F. Riegel, Ph.D., Director; David Birch, Ph.D., Co-Director; and staff, Language Development Program, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): Department of Psychology, Speech Clinic, and Mental Health Research Institute, University of Michigan; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-BU-4 THE CHILD'S ACQUISITION OF GRAMMAR

Purpose: To describe the acquisition of syntax as a succession of generative grammars.
Methods: Longitudinal study over a 3-year period. Weekly half-hour samples of child's speech and speech of parent to child. Analysis by methods of structural linguistics.
Duration: June 1963-May 1967.
Investigator(s): Roger Brown, Ph.D., Professor of Social Psychology, Department of Social Relations, Harvard University, Cambridge 38, Mass.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Harvard Educational Review, Spring 1964; Brown, R., Social Psychology, New York: Free Press, 1965.

Intellectual

19-CA-1 INFANT INTELLECT AND EXPERIENCE

Purpose: Validation of Piaget's theory, as corollary to the development of a scale of infant psychological development based on his principles and on empirical work.
Subjects: 84 1- to 24-month old babies in the last-tested group.
Methods: Observation.
Findings: Reliability of observers better than consistency of child over 48-hour period.
Duration: January 1964-December 1966.
Investigator(s): J. McVicker Hunt, Ph.D., Professor of Psychology, and Ina C. Uzgiris, Ph.D., Assistant Research Professor of Psychology, University of Illinois, Urbana, Ill.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Papers planned for publication 1965-1966.

19-CA-2 DIFFERENTIAL ABILITIES OF SIX-YEAR OLD CHILDREN

Purpose: The study is an attempt to explore the structure of ability of a group of six-year old children through the identification and measurement of five hypothesized ability domains: memory, cognition, convergent production, divergent production, and evaluation. One ability factor within each of the

BEST COPY AVAILABLE

domains is hypothesized, viz., memory span, induction, visualization, originality, and figural identification.
Subjects: 100 children within three months of their sixth birthday.
Methods: Three tests of each hypothesized ability will be constructed and administered to subjects. Appropriate statistical procedures, including the extraction and rotation of the factors, will be performed.
Duration: January-December 1964.
Investigator(s): Russel E. Orpet, Ed.D., Associate Professor, California State College, 6101 East Seventh St., Long Beach, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-CD-1 ORDER EFFECTS IN STUDIES OF COGNITIVE OPERATIONS

Purpose: To ascertain whether the presentation of Piaget-type cognitive tasks in different orders, affects the results obtained; to investigate the relation among a number of Piaget tasks; and to see if there is a relation between cognitive development and social interaction.
Subjects: 96 children, 32 from each of 3 age groups (8, 9, 10) chosen randomly from the population of one elementary school.
Methods: Two kinds of tasks, conservation and transitivity (a relation is transitive if, when A is related to B and B to C, A is also related to C), presented in counterbalanced order to each subject; subjects are also given tasks involving moral judgment, class inclusion, and perspective (taking another's point of view); and at each age, pairs of subjects who are both high in cognitive development or both low, or one high and one low, are given a task where they must interact in order to solve the problem. The general design has also been repeated with adults.
Duration: September 1964-August 1965.
Investigator(s): Philip A. Cowan, Ph.D., Assistant Professor of Psychology, University of California, Berkeley 4, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: At least two papers are planned, probably to be submitted to Child Development.

19-CD-2 STUDIES OF VERBAL MEDIATION IN CHILDREN

Purpose: To test various ramifications of the "verbal mediational deficiency hypothesis" in particular, and to examine the verbal mediational process in general.
Subjects: Preschool and elementary school children.
Methods: Training is given in labeling; then testing is carried out to determine what influence this function has on the subject's overt behavior.
Findings: A study was completed which showed that children aged three to four were not deficient in their ability to utilize their own verbal labeling responses as cues for overt choice responses, as compared to children aged seven to eight.
Duration: September 1964-June 1966.
Investigator(s): Irwin William Silverman, Ph.D., Assistant Professor of Psychology, University of Waterloo, Waterloo, Ont.

19-CD-3 POTENCY OF MODELING CUES IN IMITATION AND VICARIOUS REINFORCEMENT SITUATIONS

Purpose: To determine if the effectiveness of a model can be manipulated by systematically varying the number and intensity of the stimuli presented by a model to an observer. It was predicted that increasing the diversity or number of modeling cues will enhance their salience, with resultant increments in the incidence of imitative responses.
Subjects: Two experiments were carried out with a total of 353 children from the first and third grades. Subjects were seen in groups of five same-sex, same-age peers.
Methods: Experiment I presented subjects with symbolic models who made choices on a pair of two-choice tasks. Subsequent to model exposure, children made choices on the same tasks. Model number was varied from one to five across groups. Control subjects made choices in the absence of a model. Experiment II provided treats as a reward for participation in the first experiment. Children were exposed to a peer model who made a choice between a novel and a popular drink, and was reinforced for his selection. Then subjects were given the choice. Control subjects saw a nonreinforced model, or performed without a model.
Findings: Experiment I: A significant positive correlation was obtained between number of models presented and frequency of matching responses.
Experiment II: Differences among experimental groups were minimal, but suggestive of some interesting age and sex relationships in the vicarious reinforcement situation.
Duration: September 1964-June 1965.
Investigator(s): Adrienne K. Barnwell, Ph.D. Candidate, Department of Psychology, Northwestern University, Evanston, Ill.
Publication: Dissertation Abstracts.

19-CD-4 EVENT-MATCHING

Purpose: Determination of differences among age, intelligence, and ethnic groups and of determinants in process of matching random and systematic events.
Subjects: White and Negro normals and mental retardates of varied age groups.
Methods: Program events on Posner 2-light box; subjects attempt to match, by anticipation method, which of the lights will appear next.
Findings: Initial results suggest slower matching but similar asymptote in mental retardates to that in normals (as in literature).
Duration: July 1964-1965.
Investigator(s): James A. Posner, Ph.D. Candidate, and Willard H. Nelson, Ph.D., Associate Professor of Psychology and Education, Florida State University, Tallahassee, Fla.

19-CD-5 EFFECTS OF CORRELATED REINFORCEMENT IN CHILDREN

Purpose: To determine the effects of correlated reinforcement on the performance of children; to devise a mathematical model which will adequately describe the above performance; and to determine what parameter, if any, is related to developmental level.
Subjects: Normal boys and girls, preschool, grades 1-12 and undergraduate college students.
Methods: Subjects turn a crank for five-second trials. The speed of crank-turning determines the occurrence of reward. Matched pairs of subjects are selected on the basis of preliminary trials. One of the pair (experimental)

will be rewarded for certain speed of crank-turning. The other subject (control) is rewarded in precisely the same way as was his experimental mate, i.e., his own speed does not affect his reward. A divergence between experimental and control speeds over trials indicates that the subjects are affected by the correllated condition. For adults the rewards are money. For children rewards are accummulated lights which are traded for pre-selected toys.

Findings: Sex and handedness do not interact with any of the learning measures at any developmental level; for a condition in which subjects must turn slowly, preschool and kindergarten subjects are not affected. Older subjects are affected but third graders learn with far less reward than older subjects.

Duration: September 1964-August 1967.

Investigator(s): Charles S. Feldstone, Ph.D., Assistant Professor of Psychology, University of Connecticut, Storrs, Conn.

Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: *Journal of Experimental Child Psychology*, in press. Additional similar publications are planned.

19-CG-1 EFFECTS OF DELAY OF REWARD AND DELAY OF PUNISHMENT ON CHILDREN'S LEARNING

Subjects: Kindergarten to high school age children.

Duration: 1964-not reported.

Investigator(s): Richard H. Walters, Ph.D., Professor and Chairman, Department of Psychology, University of Waterloo, Waterloo, Ont.

Cooperating group(s): National Research Council of Canada.

Publication: *Child Development* 35:275-280, 1964; *Psychonomic Science* 1:307-308, 1964.

19-CG-2 OBSERVATIONAL LEARNING IN SOCIAL SITUATIONS

Subjects: Kindergarten to high school age children.

Duration: 1963-not reported.

Investigator(s): Richard H. Walters, Ph.D., Professor and Chairman, Department of Psychology, University of Waterloo, Waterloo, Ont.

Cooperating group(s): Defense Research Board of Canada.

Publication: *Perceptual Motor Skills* 18:469-483, 1964; *Advances in Experimental Social Psychology* 1:231-276, 1964; *Journal of Experimental Child Psychology* 1:269-280, 1964 and in press; *Advances in Child Development and Behavior*, Vol. 2; New York: Academic Press, 1965.

19-CG-3 INTERSENSORY TRANSFER OF LEARNING IN YOUNG CHILDREN

Purpose: Studies have been done, using adult human subjects and animal subjects, indicating that controlled stimulation in a given sensory medium (visual, tactile, auditory, etc.) may result in improved performance in the solution of problems presented via other sensory modalities. The precise conditions under which the phenomenon may occur are not understood. The present study is proposed to determine the limits and efficiency of this phenomenon (intersensory facilitation of learning) with children.

Subjects: Children between the ages of 3 and 12. Control subjects of equivalent age and intelligence, but with different pretraining experience.

Methods: Through carefully controlled stimulation in given sensory modalities followed by examination of the subjects' performance on standardized tasks involving a different modality, it is intended to determine the significance of the pretraining experiences in facilitation of final task performance. Variations on well-known discrimination learning procedures will be employed.

Investigator(s): D. Bruce Gardner, Ph.D., Professor of Psychology; George Karas, Ph.D., Associate Professor of Psychology; and Leroy Wolins, Ph.D., Associate Professor of Psychology and Statistics, Iowa State University, Ames, Iowa.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-CG-4 THE EFFECTS OF RELATIVE "DEPRIVATION" OF AND "SATIATION" FOR A SOCIAL STIMULUS ON ITS SUBSEQUENT REINFORCING EFFECTIVENESS: A PILOT STUDY

Purpose: To vary the availability of a class of stimuli (e.g., the word "good") to subjects in the period immediately preceding a test, in order to determine whether such preconditions would qualify the reinforcer effectiveness (or saliency) of that stimulus class in subsequent performance and learning.

Subjects: Boys, kindergarten through third grade.

Methods: Designs employed are rather like those used in the study of "appetitive drives". Limiting the availability of the stimulus class relative to its usual availability pattern is taken to constitute "deprivation", and providing a relative abundance of stimuli is taken to constitute "satiation", when in an immediately subsequent test in which the stimulus class is made contingent on a response, that stimulus is found relatively more effective in the former case and relatively less effective in the latter.

Duration: Continuing through 1966.

Investigator(s): Jacob L. Gewirtz, Ph.D., Research Psychologist, Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, 2N248 Clinical Center, Bethesda, Md. 20014.

19-CG-5 THE OBSERVING RESPONSE AND SPATIAL CONTIGUITY IN TACTUAL DISCRIMINATION LEARNING OF CHILDREN

Subjects: Four groups of fourth-grade children.

Methods: Children were presented with a tactual discrimination learning task in which the spatial contiguity relationships among stimulus, response, and reward were varied. The number of times and the length of time that subjects touched the discriminands were measured and related to the learning process.

Findings: No significant effect of contiguity was found; however, both frequency and time measures showed a consistent pattern, viz., a peak at criterion and a decrease thereafter. Results were in agreement with those of recent studies and were interpreted within the framework of observing response theory.

Duration: June 1964-June 1965.

Investigator(s): Richard A. Wunderlich, Ph.D., Associate Professor, and Virginia Ioria, B.A., Graduate Assistant, Catholic University of America, Washington, D. C. 20017.

19-CG-6 LEARNING STYLES OF PRESCHOOL CHILDREN

Purpose: To determine individual learning styles--auditory, visual, and kinetic preferences.
Subjects: Brooklyn College's Early Childhood Center population.
Methods: Observation, testing.
Duration: November 1964-indefinite.
Investigator(s): Leonore Boehm, Ph.D., Assistant Professor of Education; and Clara Loomanitz, Ed.D., Director, Early Childhood Center, Brooklyn College, City University of New York, Brooklyn 10, N. Y.

19-CJ-1 A FOLLOW-UP NORMATIVE STUDY OF NEGRO ELEMENTARY SCHOOL CHILDREN IN THE SOUTHEASTERN U.S.

Purpose: To follow up the 1960 normative sample of Negro elementary school children used in the standardization of the 1960 Binet.
Subjects: 320 children in grades 5 through 10 in 3 locations in Florida.
Methods: Retesting of 1960 normative sample on same instruments: Binet, California Achievement-Demographic Sheet.
Duration: January-December 1965.
Investigator(s): Wallace A. Kennedy, Ph.D., Associate Professor, Department of Psychology, Florida State University, Tallahassee, Fla.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-CJ-2 THE INFLUENCE OF STIMULATION ON THE VARIABILITY OF INFANT TEST SCORES

Purpose: To investigate the day-to-day variability in scores made by infants on developmental tests and to determine extent to which such variability is influenced by individual's state of arousal at time of testing.
Subjects: 16 infants between the ages of 5 and 7 months.
Methods: Each infant is tested on three successive days under identical, standardized conditions. A 12-minute period of no stimulation precedes the test on the first day, but for the second and third days the experimental group receives stimulation through interaction with an adult during this period while the control group continues to receive no stimulation at this stage of the session. Infants are tested with scales from the Griffiths Mental Development Test.
Duration: 1964-1965.
Investigator(s): H. R. Schaffer, Ph.D., Lecturer, Department of Psychology, University of Strathclyde, Glasgow C.1, Scotland.

19-CJ-3 INFANT TESTS AS PREDICTORS OF ADULT INTELLIGENCE

Purpose: Statistical analysis of the predictability of adult measures from early infant and preschool tests. Stress is not so much on prediction of test scores as to discover type of item in infant and preschool tests which provides prediction for adult tests.
Subjects: Infants who were later placed in adoptive homes and a smaller group of infants living with their parents were tested with the Cattell-Stanford and Kuhlmann Developmental Scale at three-month intervals from three months of age through 18 months, then at yearly intervals from two

through six years of age. These 59 children are now 16 to 22 years of age. Methods: The plan is to contact the subjects and administer adult forms of the two original tests. Use will be made of additional information on and history of the child in evaluating early and adult tests. This information is in the form of reports sent to the referring agency, which contained in addition to the test results, observations of the child's behavior and any special reports made by the parents concerning the intervening period. Comparison of the adopted and nonadopted children's records will be made. This data will permit comparisons of the children before placement and their subsequent adoption. Although the number of children who were living with their parents is smaller, some comparisons between the groups will be possible.
Investigator(s): Anna S. Elonen, Ph.D., and William L. Hays, Ph.D., Professors of Psychology, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-CM-1 CHILD'S WORLD OF LEARNING

Purpose: To describe children's perceptions of learning in terms of process, concreteness, and extension of principles and details. This is being compared with teacher and curricula perceptions.
Subjects: Pupils of several elementary schools.
Methods: Children teaching children; tapes; classroom observation; and group and individual interviews.
Findings: So far, suggestive that children tend to see procedures as more important than principles.
Duration: Fall 1964-1966.
Investigator(s): Mary Alice White, Ph.D., Associate Professor of Psychology, Teachers College, Columbia University, New York, N. Y. 10027.
Cooperating group(s): New World Foundation.
Publication: Mimeographed copy of preliminary results available; further publication planned in 1965-1966.

19-CM-2 THE MEANING OF PRAYER: A DEVELOPMENTAL STUDY

Purpose: To understand the nature of the conceptual development of the meaning of prayer in children.
Subjects: 160 children from 5 to 12 years of age, 80 males and 80 females, 20 at each age level.
Methods: Projective pictures of persons at prayer; extended individual interviews based on a series of preconstructed and tested questions.
Findings: A very regular and orderly sequence of stages was revealed: a global-undifferentiated stage; a concrete-differentiated stage; and an abstract-differentiated stage. The content of prayer went from an egocentric to an allocentric mold, and from more immediate to more distant and social items.
Duration: September 1964-June 1965.
Investigator(s): Diane G. Long, Ph.D., Clinical Psychologist, Camarillo State Hospital, California State Department of Mental Hygiene, Camarillo, Calif; David Elkind, Ph.D., Associate Professor, and Bernard Spilka, Ph.D., Professor, Department of Psychology, University of Denver, Denver, Colo.
Publication: Data now available. Paper presented at convention of the Religious Research Association in Chicago, June 1965.

19-CM-3 NUMBER CONCEPT DEVELOPMENT IN CHILDREN

Subjects: Preschool and early-school children, normal, retarded, and brain-damaged.

Methods: Two main approaches are used: standard discrimination learning techniques, and Piaget-type studies.

Duration: April 1963-indefinite.

Investigator(s): P. C. Dodwell, Ph.D., Associate Professor of Psychology, Queen's University, Kingston, Ont.

Cooperating group(s): Ontario Mental Health Foundation.

Publication: Published in form of progress reports to the Ontario Mental Health Foundation.

19-CM-4 ASSOCIATIVE CLUSTERING IN PRESCHOOL NURSERY CHILDREN

Purpose: The associative clustering method is used to study the development of concept utilization in preschool nursery children; and to test the hypotheses that associative clustering of children will be positively related to educational level of their parents and the level of training of their nursery school teachers.

Subjects: 210 "normal" nursery school children, ages 2 to 5.

Methods: Three dimensions of stimulus support (words, pictures, things) are used to present a stimulus list of 12 items organizable into the four categories of toys, fruits, clothing and eating utensils for free recall. Relationships between associative clustering and the traditional variables of verbal learning such as serial order and total recall will be examined. Performance of subjects will then be used as a comparative standard for future studies of concept utilization in retarded and autistic children.

Duration: June 1963-June 1964.

Investigator(s): Ernest Lawrence Rossi, Ph.D., Post-Doctoral Fellow in Clinical Psychology; and Hedda Bolgar, Ph.D., Chief Psychologist, and Director, Clinical Psychology Training Program, Psychiatric and Psychosomatic Research Institute, Mount Sinai Hospital, 8720 Beverly Blvd., Los Angeles 48, Calif.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-CM-5 DEVELOPMENTAL DETERMINANTS OF CUE SELECTION IN CONCEPT LEARNING

Purpose: The study represents an attempt to answer two basic questions: (1) What is the effect of verbal mediation on cue selections? and (2) What is the effect of motivation on verbal mediation in a cue selection task situation? The initial experiment is designed as a necessary first study to determine effects of verbal labels as mediating responses on the breadth of concept class as measured by cue selection strategy. The extent to which category (class) width changes as a function of chronological age will be explored.

Subjects: 120 children, ages 10 to 14, from each of the fourth, sixth, and eighth grades.

Methods: Materials for the pretest will consist of two 14 x 8 1/2" sheets containing 24 2" x 2" stimuli per page. Twelve of these stimuli will be triangles, 12 quadrilaterals, 12 octagons, and 12 will be random forms. Triangles will be divided into four classes of three shapes, e.g., equilateral, right, and obtuse. The four classes will be upright, inverted, incomplete, and "dotted representations."

Investigator(s): Charles D. Smock, Ph.D., Associate Professor of

Psychology, Humanities School of Social Science and Education, Purdue University, Lafayette, Ind.
Cooperating group(s): Purdue Research Foundation.

19-CM-6 DEVELOPMENTAL STUDY OF TIME PERSPECTIVE

Purpose: To determine whether there are consistent developmental trends and class differences in length of future time perspective; and to evaluate the relationship between future time perspective and personality adjustment.
Subjects: 748 public school children equally divided between grades 5, 8, and 11.
Methods: Three measures of future time perspective (including the story completion technique), and the California Test of Personality were administered.
Duration: March 1963-continuing.
Investigator(s): Elise E. Lessing, Ph.D., Assistant Director of Research, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)

19-CM-7 DEVELOPMENT OF CONCEPT FORMATION IN CHILDREN

Purpose: To study the kinds of processes of concept formation employed by children of different levels of mental development, and to uncover some characteristics of children's thinking.
Subjects: Three groups of young children.
Methods: An experiment is to be conducted concerning the effects of variety of and instructional set on concept formation as a function of chronological age and mental maturity. Subjects are to be tested on a concept formation task.
Duration: 1965-1966.
Investigator(s): Arthur R. Jensen, Ph.D., Associate Professor of Education, and Harriett A. Podell, Ph.D., Lecturer in Education, University of California, Berkeley 4, Calif.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-CM-8 FAR TRANSPOSITION OF INTERMEDIATE-SIZE IN PREVERBAL CHILDREN

Purpose: This study is part of a larger project in which response factors underlying conceptual transfer are being investigated.
Subjects: Boys and girls in the age range 3 years 4 months to 4 years 9 months. About 400 children from the nursery schools of Montgomery County, Md. have been tested.
Methods: Subjects were screened for possession of the middle-size concept using an adaptation of the method developed by Spiker, Gerjuoy, and Shepard. Subjects were subsequently given double discrimination training of two different types, and were then tested on far transposition.
Findings: Among preverbal subjects, those over four years profit more from double discrimination training than those four years or younger, and girls more than boys. Double discrimination training involving very disparate stimulus sets and transfer to an intermediate set was also found to be more facilitative of subsequent transposition than double discrimination training

involving less disparate sets and transfer to a set beyond the range of the training sets.
Duration: 1964-continuing.
Investigator(s): Albert J. Caron, Ph.D., Research Psychologist, Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.
Publication: *Journal of Experimental Child Psychology*.

19-CP-1 A DEVELOPMENTAL STUDY OF AUDITORY APPERCEPTUAL ORGANIZATION

Purpose: To investigate the genetic development of the ability to organize material presented auditorily.
Subjects: 48 boys and 48 girls, 24 from each of 4 grades, (1, 4, 7, 11), matched for I.Q.
Methods: An auditory task consisting of 13 triads (1 demonstration and 12 experimental triads) of randomly selected tape-recorded sounds (train, cow, baby crying, wind, etc.) was created. Subjects were required to provide the story or part of a story suggested by each of the three sounds. A scoring system tapping the structural qualities of each story was created and proved reliable. (Story content is not an issue).
Findings: The youngest (first grade) group produced the poorest responses and the oldest group (11th grade) produced the best organized stories as predicted. However there were no differences between the middle groups (4th and 7th) which was not anticipated. There were no differences between boys and girls.
Duration: May 1963-December 1964.
Investigator(s): Matthew Perlman, Ph.D., Psychologist, Convalescent Hospital for Children, Rochester, N. Y.
Cooperating group(s): Fairport Central School System, N. Y.

19-CP-2 THE EFFECT OF OVERTRAINING ON LEARNING SET FORMATION IN CHILDREN

Purpose: To study differential effects of overtraining on learning set formation in problems which differ in structure.
Subjects: 8-year old children.
Methods: A series of five classification problems was used. There were four stimuli to be assigned to two classes in each problem.
Findings: Effect of overtraining on learning set formation appears to be a function of the type of problem. Transfer from problem to problem was facilitated by overtraining on individual problems only in situations in which the subject begins a categorization rule which will apply to the solution of subsequent problems of the series.
Duration: August 1964-August 1965.
Investigator(s): Judith Crooks, Ph.D. Candidate, University of Pennsylvania, Philadelphia 4, Pa. (Reported by Richard L. Solomon, Ph.D., Professor of Psychology, University of Pennsylvania.)
Publication: Plan to publish in *Journal of Experimental Child Psychology*.

19-CP-3 PROBLEM SOLVING AS A FUNCTION OF LANGUAGE

Purpose: To investigate the influence of language on problem-solving efficiency. This will involve a study of the influence of a single language (Navaho and English) on problem solving, plus the influence of two types of

bilingualism ("compound" and "coordinate") on problem solving.
Subjects: Navaho children.
Methods: Comparing the problem-solving behavior of four groups: (1) Navaho-speaking Navahos; (2) English-speaking Navahos; (3) early bilingual Navahos; and (4) late bilingual Navahos.
Duration: September 1965-August 1966.
Investigator(s): Kenneth R. Stafford, Ph.D., Associate Professor, Department of Counseling and Educational Psychology, Arizona State University, Tempe, Ariz.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-CP-4 PARAMETERS OF YIELDING IN CHILDREN

Purpose: To investigate the child's choice when forced to choose between an alternative which is perceptually correct and an alternative apparently picked by others.
Subjects: Elementary and high school subjects.
Methods: Subjects in groups of three are required to make perceptual judgments. The perceptual tasks are presented to the subject via a slide projector and the subject indicates his choice by pressing a button. Bogus norms are provided through a series of lights on a panel in front of each subject.
Findings: The magnitude of yielding is inversely related to age. No sex differences are apparent. Older children appear to be more influenced by peers while younger children are more influenced by adults. Magnitude of reward for accuracy does not seem to influence yielding in this type of situation.
Duration: March 1963-June 1966.
Investigator(s): Kenneth L. Hoving, Ph.D., Assistant Professor of Psychology, Kent State University, Kent, Ohio.
Publication: Child Development 36:1:175-184, 1965.

19-CP-5 DEVELOPMENTAL ASPECTS OF CONCEPT ATTAINMENT

Purpose: To describe developmental stages of students from first through ninth grade levels as they affect the solution of a three-dimensional classification problem; to utilize the Inhelder-Piaget, and Bruner systems of describing stages of cognitive development; and to determine if differences in developmental stages are related to verbal and/or performance-type aptitudes.
Subjects: Approximately 360 students selected at random to represent each grade from first through ninth, with about 40 from each.
Methods: Subjects will be asked to place 54 solids into a three-dimensional sorting bin. The solids will be presented as a group, with varieties as to size, color and shape. Variations are such as to present hierarchies of categorization. The bin will be made of transparent material, and in three tiers which may be stacked or lifted for access. Analysis will involve the determination of levels of cognitive development from sensorimeter schemata through formal thought, and will include a description of the mode of attack, or strategy employed by the subjects in the solution of the problem.
Duration: Not reported-December 1965.
Investigator(s): David R. Stone, Ph.D., Professor of Educational Psychology, Utah State University, University Hill, Logan, Utah.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-CP-6 AN EXPERIMENTAL STUDY OF CREATIVITY AND THE SOLVING OF SOCIAL PROBLEMS

Purpose: To present empirical evidence of the difference or lack of difference between more creative and less creative high school students in their methods of solving social problems.
Subjects: Two groups of senior high school students, 18 in each group, identified as more creative and less creative by means of Getzel's and Jackson's Creativity Tests, and matched on the basis of their scores on the California Mental Maturity Test.
Methods: Three masked situational problems of a social nature were administered to the subjects: Spearman's rank-order method for finding correlation; a t-test for correlated samples; and Chi-square were used to test the null hypotheses.
Findings: Results indicate that there are no differences between more creative and less creative senior high school children, as identified by Getzel's and Jackson's creativity measures, in their modes of solving the masked situational problems.
Duration: April-August 1963.
Investigator(s): John P. Casey, Ed.D., Assistant Professor of Education, Southern Illinois University, Carbondale, Ill.
Cooperating group(s): University High School, Indiana University.
Publication: *Journal of Educational Research*, 1966.

19-CP-7 MEDIATIONAL HYPOTHESIS IN STIMULUS GENERALIZATION

Purpose: To study development of mediational processes in children and effect this has upon primary stimulus generalization.
Subjects: 108 children divided into two groups according to chronological age: 6-7 year olds and 10-11 year olds.
Methods: Stimulus generalization board (Tempone, 1965) where a stimulus is presented for a number of trials (in this particular study 15, 30, or 45 trials). Subject was taught to make a response to this stimulus. Following this presentation, stimuli that varied along a spatial dimension were presented. Test was whether or not subject responded or generalized to these other stimuli.
Findings: For younger subjects, as the number of training trials increased the extent of generalization increased; for older subjects the opposite effect was observed, a decrease in generalization with increased training trials. The latter was attributed to the development of mediational processes in these older children.
Duration: June 1964-May 1965.
Investigator(s): Vincent J. Tempone, Ph.D., Assistant Professor of Psychology, University of Arizona, Tucson, Ariz. 85721.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Tempone, V. J., "Stimulus-response Unit and a Stimulus-response Mediational Hypothesis in Primary Stimulus Generalization," *Proceedings of the 73rd Annual Convention of the American Psychological Association*, 69-70, 1965.

19-CP-8 SOCIALIZATION FACTORS AND CREATIVITY: BIRTH ORDER

Purpose: To evaluate the evidence for a relation between birth order and creativity based on a synthesis of studies in the literature and data collected during the first phase of the study on the Development of Young Scientists.

Subjects: 97% of a sample of high aptitude male students who entered the 1963 Science Talent Search and returned questionnaires.
Methods: Statistical analysis.
Duration: 1964-1965.
Investigator(s): Lois-ellin Datta, Ph.D., and Morris B. Parloff, Ph.D., Chief, Section on Personality, Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

19-CP-9 SOCIALIZATION FACTORS AND CREATIVITY: RELIGIOUS AFFILIATION

Purpose: To evaluate the evidence for a relation between religious affiliation, religious background, and scientific creativity, using data already reported and information collected during the first phase of the study on the Development of Young Scientists.
Methods: Essentially a statistical analysis, it will differ from those reported in the literature by (1) more extensive cross-classification with variables such as socio-economic status of the home and child-rearing practices, and (2) use of analysis of variance to estimate the contribution these variables and their interaction may make to early scientific productivity.
Duration: 1964-1966.
Investigator(s): Lois-ellin Datta, Ph.D., and Morris B. Parloff, Ph.D., Chief, Section on Personality, Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

Personality

19-DA-1 CHILDREN'S NIGHTMARES

Purpose: To study nightmares in children in their relation to child development and the handling of conflicts in the various phases.
Subjects: Clinic cases and children of relatives.
Methods: Clinical observation; case study approach.
Findings: Nightmares found to be rich source of information for studying a variety of issues and conflicts.
Duration: 1961-continuing.
Investigator(s): John E. Mack, M.D., Staff Psychiatrist, Child Psychiatry Unit, and Assistant Director of Psychiatry, Massachusetts Mental Health Center, Boston, Mass. 02115. (Reported by Gregory Rochlin, M.D., Director, Child Psychiatry Unit.)
Publication: Bulletin of the Philadelphia Psychoanalytic Society, October 1964; International Journal of Psychoanalysis, in press.

19-DA-2 BELIEF AND PREJUDICE: A TEST OF ROKEACH'S THEORY

Purpose: To test Rokeach's theory that prejudice may be in large part the result of perceived dissimilarity of belief systems.
Subjects: 750 ninth graders in two urban junior high schools in New York State, non-Jewish white, Jewish, and Negro.

Methods: Attitudinal responses of subjects are separately analyzed with respect to "stimulus persons" systematically varying in race, religion, status, and similarity vs. dissimilarity of values to those previously endorsed by the respective individual subject. Dependent variables include measures of effect ("friendliness") and of social distance toward the stimulus person. Responses will also be related to a variety of other data obtained from the same subjects a year previously in a large-scale study of intergroup relations and attitudes.
Duration: May 1964-August 1965.
Investigator(s): M. Brewster Smith, Ph.D., Professor of Psychology; Jane Allyn Hardyck, Assistant Research Psychologist; and David D. Stein, Graduate student in Psychology and Research Assistant, Survey Research Center, University of California, Berkeley, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-DA-3 A NORMATIVE STUDY ON THE EMOTIONAL DEVELOPMENT OF LATENCY AGE CHILDREN

Purpose: To learn about the growth of children around the following tasks of emotional development: socialization within the peer group; establishment of trust in people; acceptance and control of the aggressive drive toward peers; establishment of positive attitudes toward academic learning; establishment of a conscience with respect to the property of others; and separation from parental figures.
Subjects: Two samples: the School Sample consists of 350 latency-age boys and 350 latency-age girls, distributed amongst ages 6 through 11 from two public school systems (one system in a lower-middle socio-economic community and the other in an upper-middle socio-economic community); the Clinic Sample consists of 100 latency-age boys and 100 latency-age girls, distributed amongst ages 6 through 11. These children have known problems in one or more of the six tasks described above.
Methods: Subjects were all administered the first six pictures of the Tasks of Emotional Development Test, which consists of photographs representing these tasks. An objective scoring system is used to rate each child's emotional development along each of the five following dimensions: Perception, Outcome, Affect, Motivation, and Spontaneity. Patterns of scores are evaluated from these basic ratings and serve as a method for categorizing the emotional development of children on each task.
Duration: September 1959-November 1965.
Investigator(s): Haskel Cohen, Ph.D., Chief, Psychological Services, and Geraldine Rickard, Ed.D., Supervisory Psychologist, Adolescent Outpatient Clinic, Department of Psychiatry, Children's Hospital Medical Center, 300 Longwood Ave., Boston 15, Mass.
Cooperating group(s): Charles H. Hood Dairy Foundation; National Association for Mental Health.
Publication: Publication is expected.

19-DD-1 A CIRCUMPLEX MODEL OF PERSONALITY DEVELOPMENT IN CHILDREN AND ADOLESCENTS

Purpose: To investigate the development of the two-dimensional factor space, or circumplex, found in Black's (1964) study, using data obtained in that study.
Subjects: 700 grade and high school students in the public schools of Peoria, Danville, and Decatur, Illinois, and the Child Development Laboratory of the University of Illinois.
Methods: Complex factor analysis of personality trait ratings by the

subjects' teachers; successive rotation of the factors around the factor space; and estimation of the variance contributions of each age level to the factors.
Findings: Two major factors identified: General Adjustment, and Introversion-Extraversion.
Duration: July 1964-not reported.
Investigator(s): Michael S. Black, Ph.D., Research Associate, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)
Publication: To be submitted to Educational and Psychological Measurement.

19-DD-2 THE LEARNING OF SELF-CONTROL

Subjects: Kindergarten to high school pupils.
Duration: 1963-continuing.
Investigator(s): Richard H. Walters, Ph.D., Professor and Chairman, Department of Psychology, University of Waterloo, Waterloo, Ont.
Cooperating group(s): National Institute of Health Committee on Child Health and Human Development; Ontario Mental Health Foundation.
Publication: Numerous articles in Child Development, Journal of Experimental Child Psychology, Journal of Consulting Psychology, etc.

19-DD-3 EFFECTS OF SOCIAL DEPRIVATION AND SATIATION ON RESPONSIVENESS TO SOCIAL AND NONSOCIAL REINFORCEMENT

Subjects: First and sixth grade children.
Methods: Children are briefly socially deprived or satiated and subsequently exposed to social or nonsocial reinforcement. Responsiveness to the more reinforced lever in a binary choice game consitutes the dependent variable. Other studies consider the length of deprivation or satiation as a variable in subsequent responsiveness to reinforcers.
Findings: Socially deprived children are more responsive to social reinforcers. However, it makes no difference whether these reinforcers are positive or negative, suggesting a general drive for sociality which acts independently of anxiety drives. Socially satiated children (and particularly boys) seem more responsive to nonsocial reinforcement, indicating that satiation may also have drive properties.
Duration: January 1964-June 1966.
Investigator(s): David L. Rosenhan, Ph.D., Research Psychologist, Center for Psychological Studies, Educational Testing Service, Princeton, N. J.
Publication: Submitted to a psychological journal.

19-DD-4 RELATION OF MANIFEST ANXIETY IN CHILDREN WITH SEX, INTELLIGENCE, AND LEARNING

Purpose: To test hypotheses relating manifest anxiety in children to sex, intelligence, and learning.
Subjects: Fourth and fifth grade children in four different elementary schools in Lexington, Kentucky.
Methods: Data collected in connection with another study, "Influence of Classroom Group Cohesiveness on Learning and Adherence to Standards"--see Bulletin 16, Research Relating to Children.
Investigator(s): Albert J. Lott, Ph.D., Associate Professor, University of Kentucky, Lexington; and Bernice E. Lott, Ph.D., Professor, Kentucky State College, Frankfort, Ky.

19-DD-5 PERSONALITY FEATURES OF POTENTIALLY CREATIVE ADOLESCENTS

Purpose: To identify personality patterns characterizing young scientists judged to be potentially creative on the basis of the quality of their scientific products. The ultimate goal of this program is to study the socialization processes which contribute to the development of relevant characteristic personality patterns.
Subjects: 537 male senior high school students classified into three groups according to degree of creative promise in the areas of science: 112 high creative, 140 middle creative, and 285 low creative. These samples were derived from data provided by the 1963 Science Talent Search conducted by the Science Service, Inc.
Methods: All subjects submitted reports of a research project which they had conducted independently. These were scored by two or more judges with regard to the creative potential demonstrated.
Duration: Not reported-1970.
Investigator(s): Morris B. Parloff, Ph.D., Chief, and Lois-ellin Datta, Ph.D., Section on Personality, Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

19-DD-6 EXTRAVERSION AND NEUROTICISM AS DETERMINANTS OF VOCATIONAL ASPIRATION

Purpose: The general hypothesis states that the ordering of vocational goal discrepancy scores for Eysenck's four criterion groups (neurotic introverts, stable introverts, stable extraverts, and neurotic extraverts) would be the same as that of his experimental studies. In addition to the ordering of criterion groups, the following hypotheses were tested: (1) introverts have higher goal discrepancy scores than extraverts; (2) neurotic introverts have higher goal discrepancy scores than stable introverts; and (3) stable extraverts have higher goal discrepancy scores than neurotic extraverts.
Subjects: 475 senior class boys in two New York City suburban high schools. Subjects were administered the Maudsley Personality Inventory and a questionnaire about their vocational aspirations. Twenty extreme scorers on the Maudsley were selected for each of the four criterion groups.
Methods: The 80 selected subjects were administered the General Aptitude Test Battery and a questionnaire about their parent's occupation. Three vocational goal discrepancy scores (intellectual, aptitude, and socio-economic) were computed for each of the criterion group subjects.
Findings: Analysis of the results indicates that the ordering of vocational goal discrepancy scores for the four criterion groups was correctly predicted for the intellectual and aptitude discrepancy scores, but not for the socio-economic discrepancy scores. However, the lack of significant differences between adjacent groups made the stability of the ordering open to question. The tests of the specific hypotheses indicated that introverts tended to aspire to occupations above their intellectual level while extraverts tended to aspire to occupations below their intellectual level. The data for the aptitude and socio-economic discrepancy scores did not support any of the specific hypotheses. The results of the study provide some support for Eysenck's paradigm, especially as it relates to differences between introverts and extraverts in their consideration of the intellectual demands of their vocational aspirations. However, differences between criterion groups were not as sharp as they were in Eysenck's experimental studies. Results do suggest that the vocational counselor must utilize counseling techniques appropriate to the client's introversive-extraversive tendency.
Duration: January 1963-January 1965.
Investigator(s): Paul Sevransky, Counseling Psychology Trainee, Psychology Service, Teachers College, Columbia University, New York, N. Y.
Cooperating group(s): Veterans Administration.

19-DD-7 STABILITY OF PERSONALITY FACTORS IN CHILDREN AND THEIR EFFECTIVENESS AS PREDICTORS OF LATER BEHAVIOR

Purpose: To determine which of the personality source traits (isolated in factor analytical studies by Cattell) are stable and which are subject to change when children move through grade school (from age 7 to 11 to 14); and to determine how effective these personality factors are in identifying children at the high-low ends of the adjustment and achievement continuum.
Subjects: 2 samples of 100 children each (50 M and 50 F) will be selected from grades 2 and 5. Both samples will be in the normal range of intelligence and have a balanced distribution of socio-economic levels.
Methods: Both groups of children will be administered the Thurstone Primary Mental Ability Tests and Cattell's Objective Personality Test. They will be asked to fill out a questionnaire derived from Cattell's factor analytical studies of personality. Their teachers will fill out a set of behavior ratings on each child. Factor scores on the following dimensions will be obtained; Cyclothymia-Schizothymia, Ego strength, Excitability, Dominance-Submission, Surgency-Desurgency, Superego strength, Immunity to threat vs. Threat reactivity, Tender vs. Tough-Mindedness. The younger group will be retested at age 11, the older group at 14. Data analysis will proceed both cross-sectionally and longitudinally. The concurrent diagnostic effectiveness will be studied with special groups of children, i.e., gifted, emotionally disturbed, delinquents, and dropouts.
Investigator(s): Emmy E. Werner, Ph.D., Agricultural Experiment Station, University of California, Davis, Calif.
Cooperating group(s): State of California.

19-DD-8 INFANT SECURITY STUDIES

Purpose: To assess degree to which a group of children deprived in infancy by an institutional environment can overcome their intellectual, social, and emotional handicaps arising from their early experiences.
Subjects: 31 children reared in an institution during infancy.
Methods: Collection and analysis of data have proceeded since 1957. Intensive records have been kept of treatment within the institution, adjustment to foster and adoptive homes, school achievement, relationship to family and contemporaries, and medical or psychiatric treatment. Intelligence and projective tests are given every three years. Clinical analysis of this data proceeds continually.
Duration: 1957-1972.
Investigator(s): Betty M. Flint, M.A., Dip. Child Study, Assistant Professor, Institute of Child Study, University of Toronto, Toronto, Ont.
Cooperating group(s): Ontario Mental Health Foundation.
Publication: Flint, Betty M., The Security of Infants, Toronto: University of Toronto Press, 1959; Flint, Betty M., The Child and the Institution-a Study of Deprivation and Recovery, Toronto: University of Toronto Press, 1965.

19-DG-1 MASCULINITY AND FEMININITY IN THE PRESCHOOL YEARS

Purpose: To investigate the nature of masculinity and femininity at the preschool level of development.
Subjects: 50 nursery school teachers and 200 three- and four-year old boys and girls in nursery schools located on the North Shore of Chicago.
Methods: Teachers will nominate more masculine and less masculine boys and more feminine and less feminine girls in their classes by a pair comparisons

method. Then they will rate the children on a graphic checklist of items which describe the characteristics and behaviors of children. The children themselves will be asked questions designed to determine their awareness of sex differences. In addition they will be instructed to "draw a person", a measure of sex identity.
Duration: December 1964-summer 1965.
Investigator(s): Karen Sue Vroegh, M.A., Research Associate, and Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill.
Publication: Article to be published in a psychological journal.

19-DG-2 A CLINICAL CONTRIBUTION TO THE PSYCHOLOGY OF THE CHESS PLAYER

Purpose: Further study of the complexities of developing ego functions in children and adolescents, particularly mastery of their expanding real environment and sublimation of instincts. Observations of chess games in the context of treatment were used to study these processes.
Subjects: Five children (one girl and four boys) ranging in age from 8 to 15, who in the course of treatment in the clinic showed an interest in playing chess.
Methods: Direct clinical observation correlating historical data and information from the treatment process with direct observations of their chess playing.
Findings: Chess, because of some of its unique aspects, provides a useful medium through which to study the complexities of developing ego functions. The game cannot be reduced to a universal, simple, theoretical formula based on instinctual considerations alone.
Duration: October 1964-June 1965.
Investigator(s): Axel Hoffer, M.D., Fellow in Child Psychiatry, Massachusetts Mental Health Center, Boston, Mass. 02115. (Reported by Gregory Rochlin, M.D., Director, Child Psychiatry Unit, Massachusetts Mental Health Center.)

19-DJ-1 DEVELOPMENT OF PRESCRIPTIVE VALUES DURING ADOLESCENCE

Purpose: The investigation has the general aim of systematically detailing the ontogenesis of prescriptive value judgments during the adolescent growth period. Subsumed under this broad directive are the following specific guides: (1) to describe the psychological processes by which adolescent boys and girls categorize, generalize, and introject (or interiorize) prescriptive values that relate to interpersonal relationships with peers and parents; (2) to examine the generality and possible elaboration of Piaget's postulation of a developmental trend from a "morality of constraint" toward a "morality of cooperation"; (3) to relate a set of theoretical inferences based on an analysis of Piaget-type "clinical observations" of prescriptive valuing to another set of inferences based on adolescents' responses to "standardized tests" of prescriptive values developed by Gardner and Thompson (1963); and (4) to attempt to extend and refine the available tests of prescriptive values so that they more nearly encompass related judgments and decisions of the adolescent youth.
Methods: Revised and new instruments will be administered to comparable samples of age-sex groups of adolescents drawn from middle class American life. These tests will be scored, and a matrix of the intercorrelations of variables prepared for factor analysis, including age and sex as variables of major interest. An appraisal of empirical and theoretical progress will terminate the proposed project.

Investigator(s): George G. Thompson, Ph.D., Professor of Psychology, Ohio State University, Columbus 10, Ohio.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-DJ-2 VALUE PREFERENCES OF ADOLESCENTS

Purpose: Isolation of value patterns for classification of value types and their frequency and distribution.
Subjects: High school juniors and seniors.
Methods: Contextual analysis of Q-Sort of Morris' Paths of Life, the AVL Study of Values, and especially designed material.
Duration: January 1965-June 1966.
Investigator(s): Paul Dempsey, Ph.D., Assistant Professor, and Irene Dempsey, M.A., Lecturer, Department of Psychology, University of California, Davis, Calif.

19-DJ-3 A SEARCH FOR A PATTERN OF DEVELOPMENT IN THE MORAL JUDGMENTS MADE BY ADOLESCENTS

Purpose: It is hypothesized that adolescents do not emerge from the level of judgment by equality (based upon cooperation and mutual respect) nor reach the level of equitable, autonomous judgment until older than the 12+ years that Piaget postulates, and that factors of environment, sex, temperament, and motivation produce variations in the rate of development.
Subjects: Three groups of boys and girls, 11-12, 13-14, and 15 1/2-18 years of age, in a homogeneous working class school population.
Methods: Intelligence and personality testing; six anecdotes posing moral conflict questions will be answered in writing. Scoring will be on Piaget levels of Equality, Equity, and in some cases Authority.
Duration: October 1959-October 1964.
Investigator(s): E. A. Peel, Education Department, University of Birmingham, Birmingham, England. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1964-1965.)

19-DM-1 INTERMITTENT PUNISHMENT EFFECTS

Purpose: To study the effects of intermittent punishment procedures on the behavior of children-primarily on their subsequent resistance to continuous punishment.
Subjects: Male and female children, ages 5-11.
Methods: Children are rewarded (marbles) for playing a game. They are also inconsistently or intermittently punished (the taste of citric acid). They are then tested for resistance to continuous punishment.
Findings: Intermittent punishment increases persistance to consistant punishment.
Duration: 1964-continuing.
Investigator(s): R. K. Banks, Ph.D., Assistant Professor of Psychology, University of Waterloo, Waterloo, Ont.
Cooperating group(s): National Research Council of Canada; Defense Research Board of Canada.

19-DM-2 EFFICACY OF ANXIETY-REDUCING TECHNIQUES IN TWO PERSONALITY TYPES

Subjects: Four groups of 20 high school students, each group containing an equal number of "sensitizer" and "repressor" subjects as identified by Byrne's Hy-Pt scale.
Methods: Each group viewed an anxiety-arousing film, then was exposed to one of four anxiety-reducing procedures: (1) distraction, (2) rationalization, (3) catharsis, and (4) control. At specified intervals, measures of skin conductance (PGR) were taken. An hour after the film, 69 free association words, including words designed to recreate the film-induced anxiety, were given to the subjects individually.
Findings: For all subject groups, the film induced anxiety, as measured by skin conductance change. The four anxiety-reducing conditions had no differential effects on the conductance measure. Rationalization was more effective than the other three treatments in reducing the threat of anxiety-related cues, as measured by reaction times for the word associations. The latter result suggests that a confrontation procedure does not need to be "feeling oriented" in order to reduce anxiety. A treatment-by-personality interaction approached significance in the analysis of variance based on word association reaction times. The "sensitizer" subjects, believed to be adept in intellectualization, tended to benefit more than the "repressors" from rationalization and catharsis. The repressors, on the other hand, found the avoidance procedures more beneficial.
Investigator(s): Geraldine K. Piorkowski, Ph.D., Clinical Psychology Trainee, Psychology Service, Veterans Administration Hospital, 1900 E. Main St., Danville, Ill.
Cooperating group(s): Veterans Administration.
Publication: Dissertation Abstracts.

Social

19-EA-1 EXPERIMENTAL ANALYSIS OF SOCIAL OPERANTS IN YOUNG CHILDREN

Purpose: The investigation deals with the trial-and-error learning of certain social behavior by young children, namely, behavior involving the manipulation of another person as a tool in obtaining rewards. Such behavior is termed social operants. The specific aims of the work are as follows: (1) to standardize an experimental situation; (2) to determine what specific kinds of social operants can be trained in this situation; (3) to determine what, if any, response classes exist for young children; for example, if saying "you stink" is rewarded, does the child merely learn to say "you stink" or does the learning generalize to other verbal insults or even to nonverbal aggression?; and (4) to discover whether the child's age related to what the child learns or how rapidly he learns it.
Methods: The general procedure will involve waiting until a specific designated response, or class of responses, occurs, and then immediately presenting a reward.
Duration: 1963-1970.
Investigator(s): Thora H. Crowder, Ph.D., and William F. Crowder, Ph.D., Associate Professors, Department of Psychology, University of Mississippi, University, Miss.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-EA-2 THE PRIVATE LIVES OF PEER GROUPS AMONG YOUTHLINGS

Purpose: To learn the thoughts, feelings, attitudes, interests, and opinions, of eleven-, twelve-, and thirteen-year old children, as they are among themselves, in a world of their own, as parents and teachers do not see them. (The author has coined the word "youthling" to emphasize that this is a special age of its own and more attention should be focused on it.)
Subjects: 200 sixth-grade boys and girls (youthlings), above average in intelligence and socio-economic background, from a suburban public school in Ohio, attended by Jewish, gentile, and some Negro children.
Methods: "Slam books" are small notebooks children secretly pass around among themselves, in which they write their frank, uninhibited opinions of each other, their teachers, their likes, dislikes, and interests. At the end of the school year the teacher explained to the children that she wanted to make a study of "slam books." She asked them to give her their slam books and to answer some questions about the books. She promised them that personal information about anyone found in the books would not be revealed. The children cooperated willingly because they trusted their teacher. The answers to the teacher's questions and the contents of the 200 notebooks were analyzed.
Findings: These most unusual documentary secret data present new fascinating material about children. They provide concrete cultural content about what is going on in our own backyard. The material may be likened to front page personal gossip about everyone and everything. It is a "Who's Who" among their peers. It reports their opinions about boy-girl relationships, personality traits, personal appearance, ambitions, hobbies, habits, likes, dislikes, school, teachers, social and home relations. The self-initiated questions give a frank, detailed rating of themselves, each other, and their teachers.
Investigator(s): Rose Zeligs, Ed.D., Certified Psychologist in Private practice, 14256 Ventura Blvd., Sherman Oaks, Calif. 91403.
Publication: Author hopes to publish this by itself or as a part of a book about "youthlings."

19-EA-3 CHILDREN'S RELATIONSHIPS WITH YOUNGER AND OLDER PEERS

Purpose: To gather normative data from children on their perceptions of and relations with older and younger peers; to ascertain the types of cross-age perceptions, attitudes and relations that currently exist among children and youth, while tracing the significant socio-cultural and socio-psychological factors that are associated with these; and to assess the effects of cross-age modeling and identification processes for the child's socialization.
Subjects: Negro and white children from grades 4, 6, 8, 10, and 12, from a variety of rural and urban settings.
Methods: Interviews, questionnaires, and observations.
Duration: September 1964-June 1967.
Investigator(s): Richard A. Schmuck, Ph.D., Program Associate, Institute for Social Research, and Assistant Professor of Psychology, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Schmuck, R. A., and Lohman, A., Peer Relations and Personality Development, Institute for Social Research, The University of Michigan, 1965.

19-ED-1 INTERPERSONAL INFLUENCES IN ADOLESCENT VENEREAL DISEASE

Purpose: The research is oriented about the psycho-social concept of "risk-taking" and will investigate and evaluate various social and psychological factors which influence adolescents to engage in or avoid sexual practices which might conceivable lead to the contracting of venereal disease.
Subjects: A sample of New York City adolescents who are venereally infected and a control group of nonvenereal adolescents.
Methods: Specific independent variables (race, religion, sex, socio-economic status, and home situation) will be correlated with type and source of knowledge, and the differential effect of these variables on adolescent behavior when these factors serve as defining agents or areas for peer group relations, parental influence, and institutional interpretations of sexual behavior, and particularly of sexual behavior which might result in the contracting of a venereal disease.
Duration: June 1963-July 1965.
Investigator(s): Daniel Rosenblatt, Ph.D., Department of Environmental Medicine and Community Health, Downstate Medical Center, State University of New York, 450 Clarkson St., Brooklyn, N. Y.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

19-ED-2 A COMPARATIVE STUDY OF THE DATING AND COURTSHIP PATTERNS OF HIGH SCHOOL YOUTH FROM LOW INCOME FAMILIES

Purpose: To assess the beliefs, attitudes, and behaviors of adolescents from poor families during the courtship process with a long range goal of intervention in this process to provide more satisfactory marital situations. Specific aims are to investigate the motivations for beginning to date, the actual processes of dating (from the first date through the "filtering" or selection processes), and the "finalization" or formal choice of a future spouse.
Subjects: Caucasian students in an urban, midwestern high school.
Methods: Field observation in the school and neighborhoods where these adolescents spend their time have been systematically recorded in a standard anthropological manner. Formal interviews are taken individually, with the students and their parents, to measure their ideas, expectations, and attitudes. Perceptions of the child will be compared with the parents' actual expectations and characteristics, and the parents' expectations with the child's actual behavior. These comparisons will give a general understanding of the amount of communication, control, and understanding that exists between parents and children regarding dating and marriage behavior.
Duration: July 1965-March 1966.
Investigator(s): Paul R. Kimmel, Ph.D., Assistant Professor of Sociology, Iowa State University, Ames, Iowa.
Cooperating group(s): Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Journal publication planned.

19-EG-1 FOLLOW UP OF SMOKING HABITS OF HIGH SCHOOL STUDENTS

Purpose: To see what changes in smoking habits have occurred over a 5-year period.
Subjects: Random sample of 560 students who were in the 10th grade in 1959.
Methods: These students had a questionnaire administered in 1959, and are

receiving a repeat questionnaire by mail.
Duration: November 1964-June 1966.
Investigator(s): Eva J. Salber, M.D., Senior Research Associate, and Theodore Abelin, M.D., Assistant Professor, Department of Epidemiology, School of Public Health, Harvard University, Boston 15, Mass.

Physical handicaps

19-FA-1 EDUCATIONAL AND MEDICAL STUDY-ISLE OF WIGHT

Purpose: To ascertain the prevalence of different kinds of handicap -- physical, intellectual, educational, behavioral, and social -- among school children; to find proportion of children who have more than one handicapping condition; and to find the factors associated with different kinds of handicap.
Subjects: 3,500 children aged 8, 9, and 10 years were given initial battery of intelligence and educational tests; 10 percent sample plus 5 percent randomly selected control group chosen for individual, clinical study.
Methods: Verbal and performance intelligence tests, reading, arithmetic, and drawing tests and teacher's questionnaire given all children. Those scoring more than two standard deviations below the mean on any tests, or discrepancies between one test score and another greater than two standard deviations, or indicated by teacher's questionnaire, were (with the 5 percent control group) seen individually for three hours by a team of psychologists and psychiatrist and given special medical examination (N = c. 600).
Duration: 1964-1966.
Investigator(s): Jack Tizard, Ph.D., Professor of Child Development, University of London Institute of Education; 57 Gordon Square, London W.C. 1; T. K. Whitmore, M.R.C.S., L.R.C.P., Medical Officer, Department of Education and Science, London; and Michael Rutter, M.D., M.R.C.P., D.P.M., Senior Lecturer, Institute of Psychiatry, Maudsley Hospital, Denmark Hill, London SE 5, England.
Cooperating group(s): Department of Education and Science; University of London; Medical Research Council; National Foundation for Educational Research; Association for the Aid of Crippled Children; Isle of Wight County Council.
Publication: Monograph on first part of the survey in preparation; further monograph under consideration.

19-FA-2 MULTIFACETED RESEARCH IN CLINICAL PROBLEMS RELATING TO CLEFT PALATE WITH EMPHASIS UPON THE SCHOOL AGE CHILD

Purpose: To discover the many but interrelated parameters of good speech result in the cleft palate patient.
Subjects: Thus far, 175 children have been studied pediatrically, psychologically, audiologically, surgically, dentally, and with relation to their speech.
Methods: Research population divided into two groups: one group of children with an excellent speech result and the other of children with poor speech. Children are compared for statistical differences in intelligence, emotional development, pediatric situation, anatomic and physiologic aspects of the palate, concomitant problems, school achievement, language development, etc.

Findings: Cleft children with good speech have significantly better velarpharyngeal closure than have those children with poor speech. There seems to be no relationship to speech development in either language development or creativity. Most cleft children are reduced in these areas. Children with borderline velarpharyngeal closure show more speech anomalies and unpredictable aspects than do children who do not achieve closure or who achieve fine closure. Children with pharyngeal flaps who have good speech show a marked consistent pattern of closure as opposed to those children with flaps whose speech remains poor.
Duration: October 1962-September 1969.
Investigator(s): Edward J. Forrest, D.D.S., M.D.; Jack Matthews, Ph.D.; Ross Musgrave, M.D.; William White, M.D.; Daniel S. Cheever, M.D.; and Betty Jane McWilliams, Ph.D., Director, Clinical Research, Cleft Palate Research Center, University of Pittsburgh, Pittsburgh 13, Pa.
Cooperating group(s): National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Many publications have already resulted from this investigation; list available from investigators.

19-FD-1 AGREEMENT AND UNCERTAINTY IN SPEECH EVALUATION

Purpose: To compare the responses of parents, students, and staff members to a standard diagnostic rating scale.
Subjects: 19 parents, 5 students, 3 staff, and 19 successive children referred to speech clinic.
Methods: Subjects independently completed a diagnostic rating scale on 19 subject children. Responses were compared for a number of diagnostic and prognostic aspects.
Findings: Parents differ significantly from students and staff members. Differences, however are closely tied to certain areas of diagnostic judgment.
Duration: July 1964-August 1965.
Investigator(s): Henry Goehl, Ph.D., Associate Professor of Speech, Temple University, Philadelphia 22, Pa.
Publication: Plan to submit to Journal of Speech and Hearing Disorders.

19-FD-2 EARLY REFERRAL OF CHILDREN WITH OBSCURE LANGUAGE DISORDERS

Purpose: To assess extent of language disorder problems in young children; to encourage their early referral by providing a diagnostic service which at present does not exist; to evaluate the success of this diagnostic approach; and to determine the need for a center providing more intense evaluation services over a period of months or years.
Methods: Referrals will be accepted after a preliminary diagnostic process has eliminated language problems associated with well-known pathologic entities. The feasibility of an additional diagnostic service which allows for observation of children over several days or weeks will be tested.
Duration: Not reported-January 1966.
Investigator(s): Angie Connor, M.D., M.P.H., Executive Officer, Mental Retardation Division, Hawaii State Department of Health, and Amy B. Foster, Supervisor of Speech and Hearing, Hawaii State Department of Education, Honolulu, Hawaii.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

19-FD-3 DIAGNOSIS OF CYSTIC FIBROSIS IN THE NEWBORN PERIOD

Purpose: To make treatment available as early as possible and to give genetic counselling.
Subjects: Newborn infants.
Methods: Silver electrode heated aluminum cylinder sweat test.
Findings: Can test successfully on the third day of life (48+ hours).
Duration: December 1964-indefinite.
Investigator(s): Warren J. Warwick, M.D., Assistant Professor of Pediatrics, University of Minnesota, Minneapolis, Minn.
Cooperating group(s): National Cystic Fibrosis Research Foundation.
Publication: Early results presented at Cystic Fibrosis Club 1965. Publication in *Pediatrics* is planned.

19-FD-4 DIAGNOSTIC AND PROGNOSTIC TECHNIQUES IN CLEFT PALATE

Purpose: To identify observations which are useful in predicting success of the physical management of cleft palate.
Subjects: 200 children, newborn to age 15.
Methods: A variety of observations will be made for subjects on an annual basis over a period of 15 years. Observations include the areas of surgery, dentistry, speech pathology, audiology, radiology, psychology, and social history.
Duration: June 1963-continuing.
Investigator(s): Hughlett L. Morris, Ph.D., Director, Cleft Palate Research Program, University of Iowa, Iowa City, Iowa.

19-FD-5 A DEVELOPMENT AND VALIDATION STUDY OF PSYCHOMETRIC TESTS OF MENTAL IMPAIRMENT IN BRAIN-DAMAGED CHILDREN

Purpose: To investigate the validity and reliability of the Dynamic Visual Retention Test, and to discover what it reveals about specific types of cerebral dysfunction; to study its correlation with other types of visual tests (e.g., Benton's VRT) and similiar tests in other sense modes (e.g., Seashore Tonal Memory Test).
Subjects: Children, ages 8 to 15 years inclusive, with medically documented types of brain damage and cerebral dysfunction.
Methods: A neuropsychology laboratory making use of the full Halstead battery, the Benton battery, investigator's Dynamic Visual Retention test, the Wechsler and some other intelligence tests and various other sensory and motor tests, was set up in the spring of 1964. Children are seen daily, and are administered this battery which takes about five hours to carry out. Letters are sent to the neurologist, the parents, and the teachers, if requested.
Duration: 1963-continuing.
Investigator(s): W. H. Gaddes, Ph.D., Professor and Head, Department of Psychology, University of Victoria, Victoria, B. C.
Cooperating group(s): Department of National Health and Welfare of Canada.
Publication: Mimeographed publication of normative data available. Other publication anticipated.

19-FD-6 HOMOCYSTINURIA IN CASES OF ECTOPIA LENTIS AND/OR PRESUMED MARFAN SYNDROME

Subjects: Cases of ectopia lentis and/or Marfan syndrome ascertained through ophthalmologists throughout the country.

Methods: Subjects will be screened for homocystinuria using the cyanide nitroprusside test. "Positives" will be confirmed with high voltage paper electrophoresis. Full family studies with attention to consanguinity and ethnic origin and full clinical evaluation including skeletal, vascular and mental investigation will be performed in each case. Methionine loading for the detection of heterozygotes and dietary treatment of homozygotes will be explored.

Investigator(s): Victor A. McKusick, M.D., Professor of Medicine; R. Neil Schimke, M.D., Research Fellow; and Peter Hathaway, M.D., Research Fellow, Johns Hopkins University School of Medicine, Baltimore, Md. 21205.

Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-FG-1 COGNITIVE DEFICITS AND BRAIN DYSFUNCTION IN EPILEPSY

Subjects: Children from age 3 to 18 with epilepsy in the following groups: right temporal lobe epilepsy, left temporal lobe epilepsy, bitemporal, maximal right or left, and centrencephalic; normal controls.

Methods: Criterion or experimental groups will be formed by use of criterion measures from EEG data, neurological examination data, and seizure behavior. Differences between groups will be studied on an extensive battery of individually administered cognitive-perceptual-motor tests, covering the following dimensions: visual perception, auditory perception, tactual perception, visual-motor, motor, learning, concept formation, memory, and language functions.

Findings: Preliminary analysis indicates factor structure in epilepsy patients is comparable to normal groups on WISC, WAIS, WB I and WB II. Wechsler scales differentiate temporal lobe seizure points, lateralized right or left with 87 percent accuracy.

Duration: January 1962-January 1969.

Investigator(s): Raymond D. Dennerll, Ph.D., Executive Director and Director of Psychological Research, Michigan Epilepsy Center, 10 Peterboro, Detroit 1, Mich.

Publication: Journal of Clinical Psychology 20:236-240, April 1964; 28:278-284, 1964.

19-FG-2 PERCEPTUAL THRESHOLDS OF NONVISUAL LOCOMOTION

Purpose: To determine perceptual thresholds of gradient and curvilinearity of pathway when walking without vision. Subproblems will involve relating the "veering" tendency and the accuracy of directioning movements to these threshold measures.

Subjects: Three groups of 50: children blind from birth (6-18 years); children accidentally blind; and sighted controls.

Methods: Perception of gradient is measured with an adjustable treadmill; veering tendency is measured via a straight line crossed by arcs marked off in degrees. Directionality is evaluated with a large 360-degree protractor; and accuracy of the perception of curvilinearity is evaluated via pathways curved to various degrees.

Duration: 1965-1966.

Investigator(s): Bryant J. Cratty, Ed.D., Assistant Professor of Physical Education; Robert S. Hutton, Research Assistant II, Department of Physical

Education; and George A. Horton, Research Assistant II, Department of Psychology, University of California, Los Angeles 24, Calif.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-FG-3 SELF-CONCEPTION AND GENERAL ADJUSTMENT OF DEAF TEENAGERS

Purpose: To see if degree of social interaction has any relationship to general, home, social, and school adjustment of deaf people.
Subjects: 102 students, ages 13-21, in residence at the Missouri School for the Deaf in Fulton, Missouri, during 1963 and 1964.
Methods: 20-statements test to measure self-concept; questionnaire to measure social interaction; and the Brunschwig Adjustment Inventory to measure general, social, home, and school adjustment.
Duration: April 1964-June 1965.
Investigator(s): Sue Titus (Ph.D. Candidate, University of Missouri), Instructor in Sociology, Cornell College, Mt. Vernon, Iowa 52314.

19-FG-4 PSYCHOPHYSIOLOGICAL REACTIVITY OF ASTHMATIC CHILDREN

Purpose: To determine if asthmatic children differ significantly in physiological and psychological responses to two mild discrete stimuli (shock and tone) and to a more stressful problem-solving task during which subject is criticized for his performance.
Subjects: 50 asthmatic and 50 nonasthmatic males, 10 to 14 years old.
Methods: Each child completes modifications of a Mood Adjective Checklist and the Autonomic Perception Questionnaire, and is interviewed to determine his psychological reactions to the stress stimuli. Physiological responses include GSR, heart rate, skin temperature, muscle potentials, respiration, and finger plethysmograph. In addition to separate analyses, interactions between psychological and physiological responses will be evaluated.
Findings: Pilot study indicated significant differences between asthmatic and nonasthmatic subjects in cardiovascular responses which were not due to medication or pulmonary deficiencies or obstruction *per se*.
Duration: May 1965-April 1967.
Investigator(s): William W. Hahn, Ph.D., Psychophysiologist, Children's Asthma Research Institute, 3401 W. 19th Ave., Denver, Colo. 80204.
Publication: "Autonomic Responses of Asthmatic Children," *Psychosomatic Medicine*, in press; data for future publications will be submitted to *Psychosomatic Medicine* when available.

19-FG-5 THE CONSTRUCTION AND EVALUATION OF A DIAGNOSTIC TEST OF GRADE TWO BRAILLE MISPERCEPTIONS

Purpose: A diagnostic instrument will be constructed and evaluated in order to isolate and categorize types of misperceptions of Grade Two Braille symbols.
Subjects: Approximately 300 blind children in residential and public schools in the United States.
Methods: Test instrument will be administered to subjects and will furnish: an objectively-scored record of the frequency of Braille misperceptions; a profiled analysis of the kinds of errors according to the types of Braille

orthography and specific categories of misperceptions; and a measure of performance on a four-level scale of recognition maturity. In addition, the relation between test performance and several variables will be measured.
Duration: October 1963-April 1965.
Investigator(s): Leo F. Hanley, Ed.D., Director, College Reading Center, Boston University, 700 Commonwealth Ave., Boston, 02215; and Carl J. Davis, Ed.M., Head, Department of Psychology and Guidance, Perkins School for the Blind, Watertown 72, Mass.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

19-FG-6 MUSCULAR DYSTROPHY AND MENTAL ILLNESS

Purpose: To establish degree of mental illness or subnormality related specifically to motor handicap or specifically to muscular dystrophy.
Subjects: 28 boys with muscular dystrophy and 28 boys with other orthopedic disabilities.
Methods: Psychiatric interview; Serum Enzymes; I.Q. tests; Bender test; Human Figure Drawing Test.
Findings: Lower I.Q. in muscular dystrophy group, and a tendency to autism and hyperkinetic syndrome.
Duration: 1960-1966.
Investigator(s): C. E. Schorer, M.D., Staff Psychiatrist, Lafayette Clinic, 951 E. Lafayette, Detroit, Mich. 48207.
Cooperating group(s): Muscular Dystrophy Association.
Publication: *Psychosomatic Medicine*, January 1965.

19-FG-7 THE EARLY DEVELOPMENT OF CHILDREN WITH CONGENITAL DEFICITS IN VISION, AUDITION, OR MOTILITY

Purpose: To isolate the role of vision, audition, and motor function in the formation of the early ego; and to study adaptive solutions and adaptive failures among infants in these categories.
Subjects: Infants in each of these categories selected as soon after birth as possible, but not older than five months.
Methods: Longitudinal study of development from birth to three years--twice monthly observations, motion picture film record, and psychological testing.
Duration: April 1964-1968.
Investigator(s): Selma Fraiberg, M.S.W., Associate Professor of Child Psychoanalysis, and Barry L. Siegel, M.D., Instructor in Psychiatry, Department of Psychiatry, University of Michigan Medical School, Ann Arbor, Mich.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: One publication on earlier phase of project in collaboration with D. Freedman: "Studies in the Ego Development of Congenitally Blind Children," *Psychoanalytic Study of the Child*, 1964. Material from current project to be available within five years in these areas: reports of a longitudinal study (a biography in monograph for each child); and studies, cutting across all categories, describing and comparing adaptive problems at various stages of development.

19-FG-8 HOPES AND EXPECTATIONS OF CHILDREN WITH DISABILITIES, THEIR PARENTS, TEACHERS, AND THERAPISTS

Purpose: To advance understanding of: the psychological difference between hopes and expectations; factors which give content to hopes and expectations; conditions under which hopes and expectations interfere with each other, remain independent, and support each other; and the commonality and divergencies among hopes and expectations of children, parents, and teachers.
Subjects: 25 children in a special school for children with orthopedic disabilities, their parents, teachers, and therapists.
Methods: Interviews and drawings, interview analysis involving category analysis, ratings, statistical treatment, and conceptualizations.
Duration: June 1965-June 1967.
Investigator(s): Beatrice Ann Wright, Ph.D., and Franklin Shontz, Ph.D., Associate Professors, Department of Psychology, University of Kansas, Lawrence, Kans.
Cooperating group(s): National Society for Crippled Children and Adults; Capper Foundation, Topeka; University of Kansas.

19-FG-9 INVESTIGATION INTO THE SENSORY-PERCEPTUAL FUNCTIONING OF CEREBRAL PALSIED CHILDREN

Purpose: The chief hypothesis to be tested is that the cognitive and motor problems of brain-damaged children are related to subtle sensory defects that are overlooked in the conventional neurological examination.
Subjects: 75-100 children, ages 7 to 21, with congenital brain damage; and matched groups of normal controls.
Methods: Subjects will be studied with a variety of sensitive psychophysical techniques to determine roles that sensory deficit or limitations play in the more global perceptual functions.
Duration: June 1962-June 1965.
Investigator(s): Walter S. Neff, Ph.D., Director of Research, and Barbara C. Wilson, Ph.D., Institute for the Crippled and Disabled, 400 First Ave., New York 10, N. Y.
Cooperating group(s): Association for the Aid of Crippled Children.

19-FG-10 ADJUSTMENT PROBLEMS IN JUVENILE DIABETES

Purpose: A psychodynamic study of diabetic juveniles with emphasis on their social and emotional adjustment, their modes of handling diabetic routines, and their attitudes toward themselves and the disease. It will also measure the child's dependence-independence balance and its relationship to extremes in parental attitudes.
Subjects: 50 diabetic juveniles and their parents; control group of nondiabetics.
Methods: Subjects and parents will be compared in emotional adjustment, family attitudes, etc. with the control group. Well stabilized patients will be compared with poorly stabilized patients.
Duration: June 1963-July 1965.
Investigator(s): Charles R. Swift, M.D., and Frances Seidman, Ed.D., Child Guidance Center of Mercer County, 532 West State St., Trenton 8, N. J.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-FG-11 WHO'S HANDICAPPED?

Purpose: Follow-up study of eight handicapped children ten years after nursery school.

Subjects: Children from nursery school age to 15 years.

Methods: Observations, tests, questionnaires, school reports, interviews, etc.

Duration: 1957-1966.

Investigator(s): Alice Jerome, M.S., Teacher Supervisor, Infants' Home of Brooklyn, 1358 56th St., Brooklyn, N. Y.

Cooperating group(s): New York City Council on School Health.

Publication: May be published in book form by Twayne Publishers, New York City.

19-FG-12 PSYCHOLOGICAL EXAMINATION OF CONJOINED TWINS

Purpose: To learn what psychological techniques are available to conjoined twins in creating any degree of separateness.

Subjects: 12-year old male twins, joined inseparably at the abdomen by a large bridge beginning just above the common navel and extending to the lower abdomen.

Methods: Psychological tests were administered in the home, and father was interviewed by a psychiatric social worker. Since united twins cannot be separated physically for independent examination, a compromise in psychometric procedure was necessary. Alternate test forms were used where possible and sequence of test presentation varied for each twin. Test battery included the Peabody Picture Vocabulary Test, the Rorschach and Behn Ink Blot Tests, the TAT, Bender-Gestalt, and DAP.

Findings: Testing reveals certain relatively superficial differences in intellect and personality. However, the over-riding impression is that of two individuals desperately struggling to arrive at some kind of personal identity. It is suggested that the ultimate resolution of their dilemma will involve a fusion of identity as a unified organism.

Investigator(s): Sidney E. Cleveland, Ph.D., Chief of Psychology Service; E. E. Reitman, Ph.D., Staff Psychologist; and D. Sheer, M.S.W., Staff Social Worker, Veterans Administration Hospital, 2002 Holcombe Blvd., Houston 31, Tex.

Cooperating group(s): Veterans Administration.

19-FG-13 PREDICTING ARTICULATION FROM CINEFLUOROGRAPHIC MEASUREMENT

Purpose: To determine effect of articulation instruction on movements of the articulators; to determine relationship between reward utterances on the part of the speech clinician and change in articulation score; and to measure effect of pharyngeal obturator reduction on articulation, articulatory movement patterns, and on oral and nasal sound pressure level.

Subjects: Children with cleft palates or inadequately functioning palates, screened for auditory perception and intelligence.

Methods: Measurement of dependent variables involves articulation testing, electronic instrumentation for measurement of sound pressure level (a probe microphone is used in the measurement of nasal sound pressure level), and instrumentation for cinefluorographic filming and playback. Practice responses by the child will be correlated with a measure of articulation improvement.

Findings: Considerable acrylic can be removed from pharyngeal obturators, which were fitted by a muscle trimming process, without producing consonant distortion or nasal emission of air during sound production.

Duration: January 1964-January 1967.

Investigator(s): Ralph L. Shelton, Jr., Ph.D., and Karl A. Youngstrom, M.D., Ph.D., Associate Professors, Hearing and Speech Department, University of Kansas School of Medicine, Kansas City, Kans. 66103.

Cooperating group(s): Cleft Palate Clinic, University of Kansas School of Medicine; National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-FG-14 THE NEUROLOGICAL AND DEVELOPMENTAL EFFECTS OF NEONATAL HYPOGLYCEMIA

Purpose: To present follow-up data on eight newborn infants who exhibited hypoglycemia with neurological symptoms and 21 infants who were found to have equally low blood sugar levels but in whom no symptoms attributable to hypoglycemia were observed.

Methods: Complete physical examination; developmental evaluation based on the Gesell Developmental Schedule.

Findings: Seven of original 29 were lost to follow up; of 22 remaining, 14 were normal, 5 were abnormal, and 3 were questionable. The 5 abnormals were all in the symptomatic group. These results suggest that hypoglycemia associated with CNS symptoms in the newborn period carries a poor prognosis with respect to permanent CNS damage. Hypoglycemia unassociated with symptoms on the other hand is much less likely to result in permanent brain damage.

Duration: May 1963-March 1964.

Investigator(s): K. McRae, M.D., Assistant Director, Child Development Clinic, Children's Hospital, and Assistant Professor of Pediatrics, and J. Haworth, M.D., Assistant Professor of Pediatrics, University of Manitoba, Winnipeg, Man. (Reported by W. Wallace Grant, M.D., Director, Child Development Clinic, Children's Hospital, Winnipeg.)

19-FG-15 MOOD STATES ASSOCIATED WITH ASTHMA

Purpose: To measure degree of association of anxiety, deactivation, depression, aggression, and concentration mood states with asthma in a population of chronically asthmatic children, and to measure changes in mood states associated with relief of the symptom.

Subjects: 19 female and 18 male asthmatic children between the ages of 12 and 15.

Methods: An adaptation of the Nowlis Mood Adjective Check List was employed. Fifteen "asthma" measures taken during attacks and prior to treatment, and 10 "controls" taken whenever possible within 24 hours in the absence of symptoms, were obtained from each subject.

Findings: During both asthma and control periods, positive moods, e.g., "friendly", and "secure", predominate over negative moods, e.g., "grouchy", and "sluggish". However, there is a significant increase in negative moods and a significant decrease in positive moods during asthma. Striking individual differences, and some sex differences were noted.

Duration: November 1963-January 1965.

Investigator(s): Jonathan H. Weiss, Ph.D., Chief, Clinical Psychology, Children's Asthma Research Institute, 3401 W. 19th Ave., Denver, Colo. 80204.

Publication: Results are currently being prepared for publication. Manuscript will be submitted to *Psychosomatic Medicine*.

19-FG-16 A STUDY OF LEARNING DISORDERS IN CHILDREN WITH MINIMAL BRAIN DAMAGE

Purpose: An investigation in the area of psychosensory learning disorders in children, relating minimal brain damage to learning and adjustment.
Methods: New electronic equipment, specifically designed and constructed for this purpose at Northwestern University, makes possible the automatic presentation of auditory, visual, and tactile stimuli, and simultaneous automatic recording of responses. While the subject is receiving, integrating, and remembering the information presented, his speech, breathing pattern, and brain waves are recorded. Data to be collected include intersensory and intrasensory facility auditorily, visually, and tactually. Data will be analyzed through Northwestern's IBM 7094 computer. Findings will be applied to personal, social, educational, and vocational aspects of rehabilitation.
Investigator(s): Helmer R. Myklebust, Ed.D., Professor of Language Pathology and Psychology, and Director, Institute for Language Disorders; and Thomas Behrens, Assistant Professor of Language Pathology, School of Speech, Northwestern University, Evanston, Ill.
Cooperating group(s): Easter Seal Research Foundation, National Society for Crippled Children and Adults.

19-FG-17 FURTHER STUDIES OF VERBO-TONAL SYSTEMS

Purpose: To further define, analyze, and validate the Verbo-tonal Systems as originated by Professor Petar Guberina of Zagreb University, Zagreb, Yugoslavia. One portion of this total project involves children.
Subjects: Work is being done with the following typical population: 9 congenitally deaf children, 6 to 13 years old; 3 hard-of-hearing children, 9 to 16 years old; and 4 hard-of-hearing adults, over 29 years old.
Methods: All of the subjects are being given conventional audiometric tests: Pure-tone, Speech Reception Threshold, and Speech Discrimination, as thoroughly as possible, before they begin to train in the Verbo-tonal method. Verbo-tonal test has been or will be given at the time prescribed by the method, i.e., the hard-of-hearing were tested before training because they are able to respond in some way to speech stimuli. The deaf subjects will be given the test as soon as they too begin to respond to speech stimuli via the Verbo-tonal instrumentation. Subjects are retested periodically during the period of training.
Duration: July 1963-August 1968.
Investigator(s): John W. Black, Ph.D., Director, Speech and Hearing Science Area, and Courtney P. Stromsta, Ph.D., Professor of Speech, Ohio State University, Columbus 10, Ohio.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

19-FG-18 ON THE NATURE OF SHORT-TERM MEMORY ENCODING BY THE DEAF

Purpose: To investigate the kind of imagery deaf children use to hold material in store.
Subjects: 41 deaf children from intermediate grades, and 53 normal hearing children from the seventh grade.
Methods: A set of 27 slides, each containing 5-consonant sequence, was projected for viewing. Each slide was projected for 3.5 seconds after which the subject recorded on answer sheets what he recalled. Error matrices were constructed from the answer sheets.
Findings: Hearing subjects made a number of systematic recall errors which

could be shown to be acoustically similar to the correct letters. Deaf subjects also made certain systematic errors. These were not acoustically related to correct letters; nor insofar as the data permitted reliable test, could they be regarded as spatially related. The consistency of errors made by the deaf implies a consistent encoding procedure which is at present obscure.
Duration: November 1964-April 1965.
Investigator(s): R. Conrad, Ph.D., Assistant Director, Applied Psychology Research Unit, Medical Research Council, Cambridge, England; and Mary Lou Rush, M.S., Research Associate, Department of Speech Science, Ohio State University, Columbus 10, Ohio.
Cooperating group(s): U. S. Department of Defense; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal of Speech and Hearing Disorders, November 1965.

19-FG-19 NORMAL AND CLEFT PALATE SPEECH - PHARYNGEAL FLAP PROCEDURE

Purpose: To study physiological, physical and perceptual parameters of normal and abnormal speech; specifically, parameters of speech perception, sound power level, oral-nasal pressure and oral-nasal flow are studied relative to velar activity. Since palatopharyngeal valving plays an important role in controlling the direction of the breath stream and in the modification of oral pressure, the parameters under investigation are useful in evaluating the efficacy of specific surgical techniques employed to correct palatopharyngeal incompetence.
Subjects: So far, 60 adults and children who have normal speech; and 57 cleft palate subjects.
Methods: To study inter-related parameters, instrumentation is employed which makes it possible to obtain synchronized recordings of speech, intra-oral, intra-nasal air pressure, oral-nasal air flow, sound power level, and the responsible physiological events as defined by high speed cineradiography.
Duration: February 1963-September 1966.
Investigator(s): J. Daniel Subtelny, D.D.S., M.S., Chairman, Department of Orthodontia, Eastman Dental Dispensary, 800 Main St. East, Rochester, N. Y. 14603. (Reported by Joanne D. Subtelny, Ph.D., Research Coordinator, Cleft Palate Project, Eastman Dental Dispensary.)
Cooperating group(s): Department of Plastic and Reconstructive Surgery, University of Rochester School of Medicine; Department of Electrical Engineering, University of Rochester; Cleft Palate Center, University of Illinois; National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Cleft Palate Journal 1:4:402-410, 1964; two other articles in press.

19-FG-20 EXPERIMENTAL INVESTIGATION OF MINOR SEIZURES IN EPILEPTIC CHILDREN

Purpose: To discover factors which determine occurrence of episodes of bioelectric disturbance in the brains of epileptic children, particularly minor seizures and subclinical paroxysms; and to learn the effect of such episodes upon behavior, especially upon the child's ability to carry out simple tasks and to remember information.
Subjects: Children, ages 8 to 16, with frequently occurring seizures, who are being investigated as inpatients in an acute neuropsychiatric hospital.
Methods: The bioelectric disturbance as recorded in the EEG is measured as

BEST COPY AVAILABLE

the child performs simple tasks whose difficulty can be systematically varied. The child's performance on simple tasks of vigilance and memory is recorded during episodes of bioelectric disturbance.
Findings: Episodes of bioelectric disturbance are most likely in those conditions which dispose the child to a very low or a very high level of arousal. When episodes of bioelectric disturbance occur, they do not cause all-or-none effects, but differentially impair efficiency according to the amount of information being processed.
Duration: Not reported-October 1968.
Investigator(s): S. J. Hutt, M.A., Research Fellow, Park Hospital for Children, Oxford University, and St. Catherine's College, Oxford, England.
Cooperating group(s): Oxford Regional Hospital Board; Sembal Trust; British Epilepsy Association.
Publication: *Developmental Medicine and Child Neurology* 5:559-571, 1963; *Proceedings of the Royal Society of Medicine* 57:13, 1964. Further studies to be published.

19-FG-21 COMMUNICATIVE DISORDERS ASSOCIATED WITH APERT-PARK-POWERS SYNDROME

Purpose: To investigate hearing levels and speech and language characteristics in patients with Apert-Park-Powers syndrome. The high incidence of hearing loss observed clinically suggests the possibility of mechanical interference with the 8th cranial nerve.
Findings: Incomplete results indicate a high incidence of hearing loss, and voice disorders related to very high arched palates, or cleft palates.
Duration: March 1963-continuing.
Investigator(s): John H. Wiley, Ph.D., Associate Professor of Speech Pathology, and Chief of Communicative Disorders Division; and Nancy A. Timmons, M.S., Assistant Instructor in Speech Therapy, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr.

19-FG-22 COMPARISONS OF HEARING LEVEL, LANGUAGE AND NONLANGUAGE SKILLS, AND TEACHER RATINGS OF DEAF ADOLESCENTS

Purpose: To describe language and nonlanguage skills in a group of students at the Nebraska School for the Deaf, and to relate these scores to teacher ratings of communicative abilities and to hearing levels. Clinical observations of poor language abilities in these subjects have raised the question of specific language disabilities as well as sensory deficit.
Findings: Incomplete results indicate language scores are very low in this group, with great discrepancies between language and nonlanguage scores in some individuals. Speech and pure tone audiometry scores are related but not perfectly correlated. Some individuals appear to have language disabilities beyond those caused by deafness.
Duration: February 1963-continuing.
Investigator(s): Marshall S. Hiskey, Ph.D., Professor of Educational Psychology, University of Nebraska, Lincoln; John H. Wiley, Ph.D., Associate Professor of Speech Pathology, and Chief of Communicative Disorders Division; and Nancy A. Timmons, M.A., Assistant Instructor in Speech Therapy, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr.

19-FG-23 REFERENT GROUPS AND GOAL SETTING IN PHYSICALLY HANDICAPPED CHILDREN

Purpose: To identify the influence of certain referent groups on the goal-setting behavior of physically handicapped children, that is, to study how the physically handicapped child sets his goals when he sees his performance as compared to physically handicapped and to the nonphysically handicapped.
Subjects: 120 children from three elementary schools for the physically handicapped.
Methods: Basic procedure is to show the child a picture of a group of either (1) physically handicapped children; (2) physically normal children; or (3) mixed physically handicapped and physically normal children, and to request that he indicate how well he expects to perform on a simple cancellation task in reference to certain standards met by one of the three groups mentioned above. The child would then be given three to four minutes of the cancellation task (e.g., crossing out all O's in a page containing various letters of the alphabet). In reality the task has little meaning in itself; the primary concern is how the child sets his goals when he believes the reference standards to be one of the groups mentioned above.
Duration: Spring-fall 1965.
Investigator(s): Reginald Jones, Ph.D., Assistant Professor of Education, and Harriet Mandell, M.A., Research Assistant in Education, University of California, Los Angeles, Calif. (Reported by Ernest P. Willenberg, Ed.D., Director of Special Education, Los Angeles City Schools.)

19-FG-24 VERBAL MEDIATION IN CEREBRAL PALSY

Purpose: To investigate the role of verbal mediation in the performance of sensory and perceptual tasks in cerebral palsied as compared to non-neurologically impaired children.
Subjects: 232 cerebral palsied and nonimpaired children ranging in age from 7 to 15. The cerebral palsied sample is being limited to congenital cases with diagnoses of quadriplegic and hemiplegic spasticity and athetosis with and without spasticity.
Methods: Psychophysical procedures: problem-solving and perceptual tasks are presented to subjects while verbal mediation is manipulated by supplying or withholding labels. The investigation involves a series of five experiments.
Duration: June 1965-May 1967.
Investigator(s): Barbara C. Wilson, Ph.D., Institute for the Crippled and Disabled, 340 E. 24th St., New York, N. Y.
Cooperating group(s): Easter Seal Research Foundation; United Cerebral Palsy, Inc.
Publication: Plan to publish in psychological journals and in child development journals.

19-FG-25 PATTERN DETECTION IN BRAIN INJURY

Purpose: To study the interpretation of the nature of perceptual defect in hidden-figure tasks for brain-injured subjects. Oculomotor control may account wholly or in part for the observed phenomena; contaminants may account for some of the findings with traditional hidden-figure tasks.
Subjects: Cerebral-palsied children and brain-injured adults, with matching controls.
Methods: Investigator will examine relationship of oculomotor control to form-detection tasks and relationship between form-detection and cognitive tasks. The statistical display should permit precise measurement of form-

detection and its contribution to subsequent cognitive achievement.
Duration: Not reported-August 1966.
Investigator(s): Charles F. Reed, Ph.D., Department of Psychology, Temple University, Philadelphia 22, Pa.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-FG-26 PSYCHOLOGICAL EFFECTS OF SICKLE CELL ANEMIA AND OTHER CHRONIC ILLNESSES

Purpose: To discover if sickle cell anemia has peculiar effects on children's social and intellectual development; to evaluate parents' attitudes toward and handling of children's illness; and to evaluate these effects against the general cultural patterns of the Negro child in order to see if the culture or the illness is responsible for any apparent differences.
Subjects: 75 sickle cell anemia patients; other chronically-ill Negro and white children; and healthy Negro and white children, all matched for age, sex, and socio-economic status.
Methods: Subjects will be examined on an intensive battery of psychological tests, and compared with controls. Subjects will be re-examined in three years.
Investigator(s): Ann F. Neel, Ph.D., Assistant Professor, Department of Pediatrics, Howard University College of Medicine, 2441 Sixth St., N. W., Washington, D. C. 20001.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-FG-27 READING AND LISTENING IN LEARNING BY THE BLIND

Purpose: To determine the relative efficiency of listening and reading (both braille and large type) as a means of learning materials from the areas of literature, social science, and science; to explore the use of accelerated aural materials where listening is found effective as a means of learning; and to study techniques for using auditory materials in learning by the blind.
Subjects: All subjects must be legally blind. In each of the three different areas being investigated, there will be 96 braille and 96 print students from grades 4, 5, and 6; and 96 braille and 96 print students from high school.
Methods: Separate analyses of variance of the treatments x treatments x treatments x levels design (2 x 2 x 2 x 3) were run for the high school group and the elementary group to determine if differences in learning of literary material resulted from any of the main effects being tested or their interactions. The treatments under study were mode of learning (reading or listening), type of reader (print or braille), and amount of practice (one-day or three-day). Grades constituted the levels. Similar analyses will be made for science and social studies materials.
Findings: Results of the study on literary material showed that while elementary students learned equally well by either listening or reading, high school students learned slightly more by reading. However, when results were evaluated in terms of the amount learned per unit of time spent, learning through listening was more efficient than learning through reading by 140 percent for elementary students and 64 percent for high school students.
Duration: September 1963-August 1967.
Investigator(s): Carson Y. Nolan, Ph.D., Director, and June E. Morris,

M.A., Research Associate, Department of Educational Research, American Printing House for the Blind, Louisville, Ky.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Results will be published, possibly in the form of a monograph, after the study is completed.

19-FJ-1 CHILDHOOD ASTHMA AND THE PSYCHOLOGICAL ENVIRONMENT

Purpose: To ascertain whether a radical change in the psychological environment will induce a change in asthma (frequency and/or severity) in selected asthmatic children while the physical environment remains constant (within limits of normal variation); to ascertain whether such a change in asthma, if obtained, is reproducible; and if such change occurs, to identify and describe those psychological variables relevant to the alteration in asthma.
Subjects: 15 children or adolescents with asthma between the ages of 7 and 16 inclusive, living in the Denver metropolitan area and being treated as outpatients by pediatricians or pediatric allergists.
Methods: Method of altering a child's psychological environment is to effect the removal of parents and siblings from the home of the child and to introduce a substitute parental figure for a period of approximately two weeks. Daily measures of pulmonary function as well as daily clinical histories of asthma and medication are obtained before, during, and past the separation period as are measures of mood state. A total of approximately 15 more extended interviews centering around the child's and parents' attitudes and reactions to separation are also conducted.
Duration: January 1965-December 1966.
Investigator(s): Kenneth Purcell, Ph.D., Director, Behavior Science Division; and Kirk Brady, M.A., Research Clinical Psychologist, Children's Asthma Research Institute and Hospital, 3401 W. 19th Ave., Denver 4, Colo.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal publication planned.

19-FJ-2 A VISUALLY-STEERED GROSS MOTOR DEVELOPMENT PROGRAM

Purpose: To improve physical, social, emotional, and learning activities of cerebral palsied children by providing early exploratory and developmental experience necessary to good learning and a healthy body image.
Subjects: 10 cerebral palsied children, aged 5 to 8.
Methods: Providing perceptual-motor experiences step by step until each child can produce the exact pattern; utilization of each sense (tactile, auditory, verbal, vision, etc.) to reinforce each stage of movement.
Findings: Considerable improvement in physical, social, emotional, and learning attitudes and abilities of children (not tested statistically as yet.)
Duration: September 1963-indefinite.
Investigator(s): James D. Fenn, M.A., Psychologist, Pittsfield Public Schools, and Acting Executive Director, United Cerebral Palsy Association of Berkshire County Inc., and Herbert I. Fischer, O.D., Optometrist, Pittsfield, Mass.
Cooperating group(s): United Cerebral Palsy Association of Berkshire County Inc.

19-FJ-3 PROVISIONS FOR THE EDUCATION OF MENTALLY RETARDED DEAF CHILDREN IN RESIDENTIAL SCHOOLS FOR THE DEAF

Purpose: To investigate and describe the extent of sources for the education of mentally retarded deaf children in residential schools for the deaf in the United States.

Subjects: Population of all residential schools for the deaf in the United States.

Methods: Information was requested from administrators, teachers, and a limited number of psychologists. Data were obtained on admission policies and procedures, prevalence, special academic and vocational provisions, qualifications of classroom teachers, and judgments of the most effective instructional organization, by means of mailed inquiry schedules, personal interviews, and on-site visits.

Duration: May-December 1965.

Investigator(s): Robert M. Anderson, Ed.D., Research Associate, University of Pittsburgh, Pittsburgh 13, Pa.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Publication: Results of this study will be available as a doctoral dissertation and as a report to the U. S. Office of Education. Other publication plans are indefinite at this time.

19-FJ-4 DEVELOPMENT OF A RESIDENTIAL EDUCATIONAL PROGRAM FOR EMOTIONALLY DEPRIVED, PSEUDO-RETARDED BLIND CHILDREN

Purpose: To identify the pseudo-retarded blind child; and to develop a treatment-scholastic program for him.

Subjects: 10 to 15 students selected from a population of multiply-handicapped youngsters enrolled in Oregon School for the Blind.

Methods: Graduated relationship with teacher-counselor in groups of two to three children; reinforcement principles in learning; and sensory training in sound laboratory.

Duration: September 1964-July 1967.

Investigator(s): Charles C. Woodcock, M.A., Superintendent, Oregon State School for the Blind, Salem, Oreg. (Reported by David Berger, Ph.D., Institution Research Coordinator, Oregon State Board of Control, Salem, Oreg.)

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-FJ-5 CAMP BRONCHABOOSE - SUMMER CAMP FOR ASTHMATIC CHILDREN

Purpose: To provide summer camping experiences for asthmatic children and allow therein a detailed study of asthmatics under controlled conditions leading to rehabilitation of these patients. Growth and development, therapy evaluation, and psychological study will be undertaken with these patients under the direction of a qualified allergist.

Subjects: Asthmatic children between ages 6 and 15.

Methods: Accepted allergy treatment combined with proper rehabilitation techniques in a nonmedical summer camp environment which has been specially designed for the asthmatic child as demonstrated by the Rehabilitation Committee of the Research Council of the American Academy of Allergy.

Duration: October 1965-October 1966.

Investigator(s): Merle S. Scherr, M.D., Medical and Allergy Director, Camp Bronchaboose, and Chief, Allergy Clinic, Charleston Memorial Hospital,

Charleston, W. Va.
Cooperating group(s): Asthma Camp, Inc., Charleston, W. Va.
Publication: Results will be published in appropriate medical journals.

19-FJ-6 RELATIONSHIP BETWEEN EARLY MANUAL COMMUNICATION AND LATER ACHIEVEMENT OF THE DEAF

Purpose: To determine the relationship between a manual communication system established in young deaf children by deaf parents and subsequent school achievement, particularly in the language arts.
Subjects: 60 deaf children who have learned manual symbolic communication from their deaf parents will be matched with 60 deaf children of hearing parents, all of them to be drawn from six schools for the deaf, and matched by sex, chronological age, school, extent of hearing loss, estimated mental ability, and socio-economic level.
Methods: Five criterion variables will be employed: proficiency in reading, speech reading, written language, speech, and general educational achievement. Teacher-Judgments and standardized tests will be employed in the data collection. Any differences will be attributed to the early establishment of manual symbolic communication.
Investigator(s): Jack W. Birch, Ph.D., Chairman, Department of Special Education and Rehabilitation, School of Education; and E. Ross Stuckless, M.S., Instructor, University of Pittsburgh, Pittsburgh 13, Pa.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-FJ-7 AUDITORY TO VIBRATORY EXPERIENCE TRANSLATION

Purpose: To test a General Auditory to Vibratory Experience Translator (GAVET), which has been developed for use by the profoundly deaf.
Subjects: Four profoundly deaf children and four matched controls.
Methods: For the research, the GAVET will be reduced to miniature scale for continuous wear. Subjects will be fitted with the GAVET, while controls will be given a bone conduction unit purported to be of advanced design. Development of communication, intellectual functioning, personality, and social relations of both groups will be studied in weekly clinical contacts and testing over a year's time. Film records of children's behavior will be made at beginning, middle, and end of the year. Behavior in these sessions will be coded and results used to provide a reliable quantitative description of the development of the two groups.
Investigator(s): Shirley J. Heinze, Ph.D., Assistant Professor of Psychology; Ramon Blatt, Principal Electronic Technician; and Carol E. Speidel, Research Assistant, Departments of Otolaryngology and Psychiatry, University of Illinois College of Medicine, 840 South Wood St., Chicago, Ill. 60612.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-FJ-8 CONGENITAL HEART EVALUATION PROJECT

Purpose: Study describes immediate and long-term results of the treatment of congenital heart disease in children, and attempts to answer such questions as: Are there critical findings which correlate highly with the

outcome of treatment, either positively or negatively? How do death rates for surgery at specific ages compare by surgical procedure? By heart center? What is the expectation of life for children with congenital heart disease? What is the functional status of children who have had heart surgery after 5 to 10 years? Is improvement sustained, or is there regression?
Subjects: Children who receive help for congenital heart disease under the California Crippled Children Services Program.
Investigator(s): Nedra B. Belloc, M.A., Research Specialist; Charles R. Gardipee, M.D., Chief, Bureau of Crippled Children Services; and Charlotte M. Sautter, A.B., Research Assistant, California State Department of Public Health, 2151 Berkeley Way, Berkeley 4, Calif.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-FJ-9 ANALYSIS OF EFFECTIVENESS OF TREATMENT FOR ORTHOPEDIC CONDITIONS OF INFANCY AND CHILDHOOD AS COMMONLY SEEN IN AN ORTHOPEDIC CLINIC

Purpose: To obtain a scientific evaluation of the actual end results following various means of treatment for childhood orthopedic conditions.
Subjects: All patients under treatment in the active Children's Orthopedic Clinic at the Medical Center of the University of Rochester School of Medicine.
Methods: IBM computer equipment will catalogue all subjects. Scientific analysis will be made of actual effectiveness of treatment for such conditions as clubfoot, congenital dislocation of the hip, Legg Perthes disease, and slipped femoral capital epiphysis, as well as the management of congenital and developmental anomalies, arthritis in children, poliomyelitis, and cerebral palsy.
Investigator(s): Robert Dickerson, Clinical Instructor; Frederick N. Zuck, Associate Professor; and Robert B. Duthie, Professor and Chairman, Department of Orthopedic Surgery, University of Rochester School of Medicine and Dentistry, 260 Crittenden Blvd., Rochester, N. Y. 14620.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-FJ-10 PLANNING FOR EVALUATION OF GOALS, METHODS, AND ACHIEVEMENTS IN A BROADLY-ORIENTED PROGRAM OFFERING SERVICES TO THE HANDICAPPED CHILD

Purpose: To develop research projects which will help answer the following general questions: How well are services for the handicapped articulated to the real needs of children with handicapping conditions and their families? Are realistic goals being set in planning for the handicapped? Is efficient use being made of highly trained personnel in working toward these goals?
Investigator(s): John B. Bartram, M.D., Professor of Pediatrics, and Victor C. Vaughan, III, M.D., Professor and Chairman, Department of Pediatrics, Temple University School of Medicine, 2600 N. Lawrence St., Philadelphia, Pa. 19133.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-FJ-11 SURGICAL SUCCESS IN CHILDREN WITH HEART DISEASE AS RELATED TO SIGNIFICANT POSITIVE CHANGES IN SOCIAL FUNCTIONING

Purpose: To learn whether children who have been physically improved by cardiac surgery experience concomitant changes in social functioning as measured by their ability to perform age-appropriate tasks before and after surgery.
Subjects: Two groups of children, those in latency period (6 to 10 years) and those in adolescent period (16 to 21 years), admitted to Clinical Center of the National Heart Institute. Subjects will have been judged symptomatic prior to surgery, and physically improved following surgery.
Methods: Developmental theories of Freud, Erikson, Josselyn, and others have been used as a basic frame of reference for determining significant life tasks of childhood. Theoretical developmental tasks have been translated into a series of perceivable behaviors. From these a schedule has been devised which will contain a series of questions concerning life tasks as they relate to latency and adolescence. Schedule will be administered subjects in interview situation at two different points in time: before surgery and following a medically appropriate period after surgery. Schedule will be administered to subjects in specified age groups as they return to clinic for follow up, with an attempt to obtain retrospective data on their functioning prior to surgery.
Duration: Not reported-June 1967.
Investigator(s): Vincenza Bowles, and Barbara A. Murphy, M.S., Social Work Department, Clinical Research Center, National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

19-FP-1 A STUDY OF MODES OF ADAPTATION TO CHRONIC ILLNESS BY PARENTS OF CHILDREN WITH FAMILIAL DYSAUTONOMIA

Purpose: To investigate psycho-social aspects of familial dysautonomia with the intent of studying behavioral management techniques conducive to optimal adjustment.
Methods: A self-administered questionnaire designed to elicit information regarding variances in adjustment as well as differences in parental attitudes and reactions was mailed to parents of children whose names appear on a list of the known cases of familial dysautonomia in this country. In addition, approximately 10 child-parent pairs admitted to the Clinical Center to participate in biological research studies will be interviewed in order to secure comprehensive social histories. Data regarding parent-child interaction will be systematically collected from observations charted on the ward by nursing staff; psychological testing of children and parents, both projective and intelligence, will provide an additional method of assessing the relative degree of adjustment and disturbance in the groups.
Investigator(s): Yolande B. Davenport, Social Work Department, Clinical Research Center, National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.

19-FP-2 PSYCHOLOGICAL STATUS OF DEAF CHILDREN AS A FUNCTION OF PARENTAL ATTITUDES

Purpose: To ascertain the effects of parental methods of child rearing upon a deaf child, as evidenced by methods of discipline, attitudes towards children in general and the deaf child in particular, and as evidenced and reflected in the behavior of the child at home and at school; to test the hypotheses: (1) that the deaf child whose parents are less concerned about

his rate of development tends to be better adjusted at school; (2) that deaf children whose mothers have significantly higher scores on Irritability and Marital Conflict will tend to be less irritable and less disruptive at school than those whose parent-scores are significantly lower; and (3) that delayed weaning and toilet training and less tension as reported by parents will characterize those children whose mothers have lower scores on Intrusiveness, Acceleration, Comradeship, and Sharing.
Subjects: Entire school population (96 children, ages 3 to 14) of Mill Neck Manor, a day school for the deaf, and their families.
Methods: Administration of a questionnaire and the PARI in a home visit; recording of deaf child's responses to a "test" of authority figures; and teachers' ratings of the children on a modification of the Haggerty-Olson-Wickman Scale. Comparisons will be made between scores from the mothers of the sample with scores obtained by Mann, Kramm, and Reed with mothers of children with other handicaps.
Duration: September 1963-August 1964.
Investigator(s): Oliver E. Graebner, Ed.D., Professor of Psychology, Valparaiso University, Valparaiso, Ind.; and Melvin W. Luebke, Headmaster, Lutheran School for the Deaf, Mill Neck Manor, N. Y.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-FP-3 VARIABLES IN DISTORTION OF HEART ILLNESS IN CHILDREN

Purpose: To isolate factors which might account for distortion of severity of congenital heart illness in children.
Subjects: Approximately 100 children between the ages of 8 and 14 (and their mothers) who will or have been examined on the cardiac inpatient or outpatient service of the University of Florida Medical Center.
Methods: A behavioral questionnaire will be given to the mother, child, and cardiologist in order to obtain a picture of how these different people view the severity of the congenital heart illness. Those subjects who view the severity of the illness as different from the cardiologists will be said to distort. An attempt will be made to ascertain the degree of relationship between such variables as socio-economic position, mothers' I.Q., personality factors, etc., and distortion.
Duration: November 1964-April 1965.
Investigator(s): David R. Offord, M.D., Instructor in Psychiatry, and Joseph F. Aponte, B.S., Research Assistant, Department of Psychiatry, University of Florida, Gainesville, Fla.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Paper to be submitted for publication in appropriate journal, Fall of 1965.

Mentally gifted

19-GA-1 VERBAL SKILLS OF SUPERIOR HIGH SCHOOL STUDENTS

Purpose: To determine the potential value of a more extensive investigation in the appraisal of verbal performances by means of analogies exercises which go beyond ordinary recognition and recall tasks commonly used in standardized tests.

Subjects: 240 tenth grade and 250 eleventh grade students who attend the Research and Guidance Laboratory for Superior Students at the University of Wisconsin.
Methods: A newly-devised exercise in verbal relationships will be administered to subjects. Results will be evaluated quantitatively, in terms of numbers of items satisfactorily completed, and qualitatively, in terms of degrees of originality and precision attained by the subjects. Experimental scores obtained will be studied as they relate to standardized test results, academic performances, vocational and educational choices, and activities of subjects as reported by themselves and by their parents and teachers.
Investigator(s): John W. M. Rothney, Ed.D., Professor of Education and Director; Marshall P. Sanborn, Assistant Professor of Education and Associate Director, Research and Guidance Laboratory for Superior Students; and Lois Witczak, Research Assistant, University of Wisconsin, Madison, Wis.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Mentally retarded

19-HA-1 EPIDEMIOLOGY OF MENTAL RETARDATION IN A RURAL COUNTY

Purpose: To determine the prevalence of mental retardation in a census population; to study the relationship of prevalence to demographic and socio-economic variables to uncover possible etiological relationships; and to study the reliability of case finding over a period of time.
Subjects: Entire population of county, ages 1-59 (17,000).
Methods: Census of county and screening of preschool, school-aged, and adult population in three stages. Those scoring below I.Q. 80 or equivalent will receive individual testing. Subjects will be retested every two years. Controls and subjects will be compared on family demographic and other types of information.
Duration: December 1964-November 1969.
Investigator(s): Paul D. Imre, M.A., M.P.H., Research Associate, and Paul V. Lemkau, M.D., Professor of Mental Hygiene, School of Hygiene and Public Health, Johns Hopkins University, 615 N. Wolfe St., Baltimore, Md. 21205.
Publication: Publication is planned.

19-HA-2 MENTAL RETARDATION JOINT AGENCIES PROJECT

Purpose: To create an effective instrumentality for improved planning, development, and coordination of services needed by the mentally retarded.
Subjects: Approximately 350 public and private agencies rendering services to Los Angeles County's 110,000 retarded children and adults.
Methods: A descriptive survey was conducted to gather data about nature and quantity of agencies' programs for the retarded; a Mental Retardation Services Board was created under the Joint Exercise of Powers provisions of the California Government Code (Sections 6500 et seq.).
Findings: There is a need for planning and coordination of services which are presently fragmented among more than 300 public and private agencies. There are major gaps in services, particularly in services for preschool and postschool retardates. There is evidence of substantial duplication of diagnostic services for school-age retardates. There are no standardized procedures for communication among agencies, resulting in impediments in

client referrals to appropriate services and in delays in transmitting case data about clients. There is a general lack of data about the characteristics and needs of the County's retardates, a lack which makes planning of services difficult.

Duration: July 1963-June 1965.

Investigator(s): Ivy P. Mooring, Ph.D., Director, and Robert Currie, M.S., Research Associate, Mental Retardation Joint Agencies Project, 731 S. Hope St., Los Angeles, Calif. 90017.

Cooperating group(s): California State Department of Mental Hygiene.

Publication: The report of the survey is available from the Welfare Planning Council, Los Angeles Region, 731 South Hope St., Los Angeles 90017.

19-HA-3 CYTOGENETIC SURVEY OF MONGOLOIDS IN BEATRICE STATE HOME

Purpose: To determine the frequency of phenotypically normal carriers for mongolism among the parents of mongoloids at the Beatrice State Home.

Subjects: 88 Trisomy G mongoloids; 1 Turner's Syndrome (XO); 5 normal leukocyte karyotypes; 5 Mosaic mongoloids (Trisomy 21/normal); 1 Mosaic mongoloid (Turner's Syndrome/Trisomy 21); and 6 D/G translocation mongoloids.

Findings: Six percent of the population studied were D/G translocation mongoloids; of the above, one-third or two percent of population studied, were born of phenotypically normal carrier mothers. The fact that five percent of the population (1 Turner's Syndrome and 5 others) were not mongoloid is merely a reflection of misdiagnosis; the detection of six mosaics (six percent) in the population studied is a reflection of perceptive diagnosis; 83 percent of the population was of the expected Trisomy 21 type of mongoloid.

Duration: February 1964-March 1965.

Investigator(s): James D. Eisen, Ph.D., Assistant Professor of Human Genetics, and Chief, Cytogenetic Laboratory, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr. 68105.

19-HA-4 A SURVEY OF 782 CASES OF MENTAL DEFICIENCY

Purpose: A basic study of physical features of the more severe grades of mental handicap, and other correlations.

Subjects: Mentally retarded children resident at the Children's Cottages, Kew.

Methods: Clerical and clinical studies of the children.

Duration: June 1961-uncertain.

Investigator(s): David Buxton Pitt, M.D., and Paul Roboz, M.D., Pediatricians, Pediatric Unit, Children's Cottages, Kew, Victoria, Australia.

Publication: Preliminary report published in the Journal of Mental Deficiency Research, March 1965.

19-HA-5 PREADMISSION SERVICE AT AN INSTITUTION FOR RETARDATES

Purpose: To follow up adjustment of applicants for admission to Rosewood State Hospital and their families, who, after preadmission service, chose not to proceed toward admission, or for whom the staff of the hospital made recommendations other than admission; and to evaluate the preadmission service offered for this group.

Subjects: 273 applicants for admission between May 1, 1958, and April 30, 1960.

Methods: Analysis of the preadmission record of the applicant; use of a questionnaire by psychiatric social workers who interviewed all families in this study that could be located; and statistical analysis of the data.
Duration: December 1962-May 1965.
Investigator(s): Kurt Glaser, M.D., Clinical Director, and Barbara A. Marlowe, A.C.S.W., Chief of Social Service, Rosewood State Hospital, Owings Mills, Md.
Cooperating group(s): Friends of Psychiatric Research, Inc.; Spring Grove State Hospital; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication in appropriate journal such as American Journal of Mental Deficiency or Social Casework.

19-HA-6 SURVEY OF BLIND RETARDED CHILDREN

Purpose: To define a group of multiply-handicapped children who may need special facilities, and to define the causes.
Subjects: Population of Kew Children's Cottages.
Methods: Inquiries through various agencies.
Duration: 1962-1965.
Investigator(s): David Buxton Pitt, M.D., Pediatrician, and Malcolm B. Macmillan, M.Sc., Psychologist, Children's Cottages, Kew, Victoria, Australia.

19-HD-1 THE UNMASKING OF MENTAL DEFICIENCY FOLLOWING THERAPY OF CHILDREN WITH PSYCHOSIS

Purpose: An analysis of two cases of children who were psychotic when first seen and for whom it was not possible to establish any reliable estimate of intellectual functioning until after their psychotic state was resolved following a long period of therapy.
Subjects: Two children, one from the ward of the Massachusetts Mental Health Center and one from the senior author's private practice. One was a boy, age four when first seen by a psychiatrist, the other a girl, age five when first seen. Each has been treated and studied over a long period.
Methods: Each child has had repeated psychological examinations and continued contact with a child psychiatrist conducting psychotherapy. One child has been on a children's psychiatric ward (Massachusetts Mental Health Center) for three years. All records of early observations will be summarized and the steps in changes in the child coinciding with the emergence of valid evidence of mental deficiency will be documented.
Findings: Both of these children at initial examination were indistinguishable from other psychotic children who subsequently proved to have normal or superior intelligence. Only after subsidence of their psychotic conditions was it possible to determine their fixed intellectual limitations by psychological tests. Their subsequent management is that appropriate for intellectually retarded children.
Duration: September 1964-July 1966.
Investigator(s): Donald S. Gair, M.D., Instructor in Psychiatry, Harvard Medical School, and Chief, Children's Ward; Shirley M. Wiesenfeld, M.S.S.W., Director of Social Work; and Aydin Cankardas Wysocki, Ph.D., Chief Psychologist, Child Psychiatry Unit, Massachusetts Mental Health Center, 74 Fenwood Rd., Boston, 02115; and Charles Hersch, Ph.D., Assistant Director, Cambridge Child Guidance Center, Cambridge, Mass.
Publication: Paper in preparation, not yet completed.

19-HD-2 PEDIATRIC AND OTHER ESTIMATES OF THE DEVELOPMENTAL LEVEL OF SUSPECTED RETARDATES

Purpose: To ascertain any differences between developmental estimates of retarded young children as seen in the various professional disciplines.
Methods: Pediatric assessments of the developmental level of suspected retardates who were referred to a Mental Retardation Evaluation Clinic were compared with assessments made by psychologists, speech pathologists, and parents.
Findings: All correlation coefficients were high, ranging from .749 to .863. The data suggest that, given experience in evaluating such a unique group of children, the pediatrician can apply his knowledge of normal growth and development to children who exhibit developmental deviation.
Duration: August-October 1964.
Investigator(s): Matilda S. McIntire, M.D., Assistant Research Professor and Research Pediatrician; and Richard A. Kurtz, Ph.D., Assistant Professor of Medical Sociology, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr. 68105.

19-HD-3 DIFFERENTIATION OF BRAIN-DAMAGED CHILDREN ACCORDING TO DEFECTS IN COMMUNICATION

Purpose: To select children with specific language disorders from a large population of children referred as retarded; and to describe the differences between this smaller group and the larger group.
Subjects: Preliminary group of 28 drawn from a population of 616 children referred for mental retardation.
Findings: Preliminary group differs significantly from total group in relationship of verbal and nonverbal abilities and in certain other characteristics. These data are being analyzed further.
Duration: October 1963-October 1964.
Investigator(s): John H. Wiley, Ph.D., Associate Professor of Speech Pathology and Chief, Communicative Disorders Division; and Matilda S. McIntire, M.D., Assistant Research Professor, and Research Pediatrician, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr. 68105.

19-HD-4 URINE CHROMATOGRAPHY IN RETARDED INDIVIDUALS

Purpose: To detect biochemical abnormalities.
Subjects: Retarded children at the Children's Cottages, Kew.
Duration: June-July 1965.
Investigator(s): K. Nicholls, B.Sc.; Paul Roboz, M.D., Pediatrician; and David Buxton Pitt, M.D., Pediatrician, Children's Cottages, Kew, Victoria, Australia.

19-HG-1 STUDY OF BLOOD LEAD LEVELS IN FOUR GROUPS OF 20 RETARDED CHILDREN EACH

Purpose: To investigate the presence of elevated blood levels in retarded and/or disturbed children.
Subjects: 80 retarded children at the Children's Cottages, and at the Oakleigh Retarded Children Centre.
Methods: Estimation of blood lead levels.

Duration: 1964-1965.
Investigator(s): S. Wiener, Ph.D.; K. Benn, D.P.M.; Paul Roboz, M.D.; and A. Christophers, D.P.H., Children's Cottages, Kew, Victoria, Australia.

19-HG-2 METHOD OF CONSTANT STIMULI USED WITH THE ROD AND FRAME TASK AS A MEASURE OF FIELD DEPENDENCE IN MENTAL RETARDATES AND NORMALS

Purpose: To develop new methods and equipment to investigate similarities and differences in field dependence over mental age, chronological age, and intelligence.
Subjects: 16 retardates; 16 younger normals; and 16 older normals.
Methods: Using a modified rod and frame apparatus derived from that of Witkin, subjects were run using the method of constant stimuli. With the frame always set at 28 degrees to the side of the rod, subjects were required to report if the rod looked upright when it was objectively set at 0, 2, 4, 8, and 16 degrees; two trials each, R and L, in a random series. Extensive pretraining was carried out with mentally retarded and younger normal subjects to ensure that they understood the task. "Lie items" (simple discriminations) were inserted throughout the test series to ensure subject attention and cooperation; subjects were dropped for failure on these items. Each subject tested on rod alone (same series), three to seven days later, for intra-subject control.
Findings: No sex differences. For small angular settings of rod, group differences confounded by discrimination difficulties. On 8 degree setting of rod (with frame), mentally retarded subjects have higher number of errors than normals. On 16 degree setting, no differences.
Duration: January-August 1965.
Investigator(s): David L. Hoats, M.A., Research Scientist, E. R. Johnstone Training and Research Center, Bordentown, N. J. 08505.
Cooperating group(s): Peter Muschal School, Bordentown Township; James MacFarland High School, Bordentown.
Publication: Report will be submitted to American Journal of Mental Deficiency or an American Psychological Association journal.

19-HG-3 GROWTH OF SENSORIMOTOR INTEGRATION AND INTELLIGENCE

Purpose: To determine the presence or absence of the size-weight and size-distance illusions over the mental age range of 1.5 to 10 years in both normal and retarded children, and to relate this to level of sensorimotor growth as clinically evaluated.
Subjects: 70 retarded subjects (size-weight). 140 retarded and normal subjects (size-distance).
Methods: Subject is trained in two-choice discrimination--weight or size--depending on illusion being tested. Once discrimination is established, critical trials are introduced to determine if illusion is present. Method is operant and nonverbal. Ample reward provided for correct choice: social, symbolic, and food.
Findings: Retarded subjects differ little from normals in that size-weight illusion is established firmly by mental age one and one-half years in majority of children tested. The magnitude of the illusion is much less, however, and typically breaks down when real weight differences reaches 20 grams.
Duration: July 1964-July 1966.
Investigator(s): Jean F. Stein, Ph.D., Associate Director of Research, Woods Schools, Langhorne, Pa.
Cooperating group(s): National Institute of Mental Health, Public Health

Service, U. S. Department of Health, Education, and Welfare.
Publication: Will submit paper to *American Journal of Mental Deficiency* or *Child Development*.

19-HG-4 PREDICTION, LEVEL OF ASPIRATION, AND EXPECTANCY OF SUCCESS IN INSTITUTIONALIZED AND NONINSTITUTIONALIZED RETARDATES

Purpose: To examine the effects of institutionalization upon optimism and self-confidence of mentally retarded adolescents.
Subjects: 11 boys, institutionalized for five years or more in a residential school for the retarded with mean age of 17 and mean I.Q. of 75; and a matched group of 11 boys living in the community, but attending day classes at the institution.
Methods: Two groups of retarded subjects (institutional and noninstitutional) and two treatment conditions (Performance Prediction and Level of Aspiration) were used in a treatment-by-levels design. Subject performed 10 trials of a nut and bolt assembly task with instructions to complete 40 assemblies in one trial before completing all 10 two-minute trials. However, experimenter manipulated subject's performance by stopping each trial after a predetermined number of units had been assembled. Golf tees in a perforated masonite board were used to allow subject to chart his trial-to-trial progress to the goal and the deadline. All subjects stated expectancy of success estimates (P(s)) after each trial. Half the subjects stated levels of aspiration for the next trial ("How many will you try to do?") while the other half stated performance predictions ("How many do you think you will do?"). A measure of actual performance was also obtained.
Findings: The institutionalized group made consistently higher estimates for their performance on the next trial and actually worked faster than the noninstitutionalized group. For both groups, levels of aspiration exceeded predictions of performance. Institutionalized subjects were more confident of ultimate success in predicting performance; residents were more optimistic when goal setting. The results have implications for the behavior of high and low self-evaluating people.
Duration: December 1964-September 1965.
Investigator(s): Marvin Rosen, Ph.D., Director of Psychology, Elwyn School, Elwyn; and James C. Diggory, Ph.D., Associate Professor of Psychology, University of Pennsylvania, Philadelphia, Pa.
Publication: Will be submitted to *Journal of Abnormal Psychology* or *Journal of Personality and Social Psychology*.

19-HG-5 CLUSTERING IN FREE RECALL: INTELLECTUAL AND DEVELOPMENTAL VARIABLES

Purpose: To investigate the growth of clustering and recall over five trials for various subject populations; to determine relationship between clustering and free recall; and to investigate two methods of increasing the free recall of mentally retarded adolescents.
Subjects: 70 adolescent retardates; 19 equal-mental age normals; 14 equal-chronological age normals; and 20 college students.
Methods: Experiment I - All subjects were presented a 20-item list consisting of five words from each of four categories. A different random order was given on each of five trials. Both the number of stimulus words recalled and the number of times a stimulus word was followed by another stimulus word from the same category were counted. Clustering above chance, based upon the number of words recalled, was measured. Experiment II - For one group of retardates, the stimulus words were presented by categories rather than randomly. A second group of retardates was instructed to recall the words in categories.

Findings: Experiment I - Retardates and equal-mental age normals did not differ from one another in amount of clustering or number of words recalled. Both equal-chronological age normals and college students recalled and clustered significantly more than the lower-mental age groups. Experiment II - Both experimental groups recalled significantly more than the retardates in the standard procedure of Experiment I; they did not differ from one another.
Duration: March-August 1965.
Investigator(s): Irma R. Gerjuoy, Ph.D., Research Scientist; and Herman H. Spitz, Ph.D., Director of Research, E. R. Johnstone Training and Research Center, Bordentown, N. J. 08505.
Cooperating group(s): Local public schools provided the normal subjects.
Publication: Plan to publish in a professional journal.

19-HG-6 COMMUNICATION PATTERNS OF MENTALLY RETARDED CHILDREN

Purpose: To determine norms, if any, of articulation development at several levels of measured intelligence and diagnostic categories.
Subjects: Patients at Pacific State Hospital, Pomona, California.
Methods: Initial and repeated evaluation with battery of assessments.
Findings: Communication patterns differ with intelligence level and diagnosed causes of retardation. Patterns within those groups are similar and serve as identification. It appears that articulation patterns have considerable diagnostic value.
Duration: 1960-1970.
Investigator(s): Irene Blanchard, Ph.D., Specialist in Communication, School Department, Pacific State Hospital, California State Department of Mental Hygiene, Box 100, Pomona, Calif. 91766.

19-HG-7 INFLUENCES OF EXTERNAL MOTIVATORS ON THE MANUAL PERFORMANCE OF INSTITUTIONALIZED RETARDATES

Purpose: To determine the effects of praise, censure, and aspiration upon the performance of retardates on a manipulation task.
Subjects: A total of 180 subjects will be employed, all with I.Q.'s between 50 and 69 (Moron range), and C.A.'s between 12 and 20. These subjects will be subdivided into six groups of 30 each (15 males, 15 females): a practice group, praise group, censure group, aspiration group, praise and aspiration group, and censure and aspiration group.
Methods: The Minnesota Rate of Manipulation Test will be employed, and each subject will be required to replace all of the pegs in the formboard. Each will be given two trials, and, with the exception of the practice group, the second trial will be held under the verbally expressed condition of either praise ("That was very, very good"), punishment ("That was very, very bad"), aspiration ("How fast do you think you will do it in this time?"), or combinations of these.
Duration: July 1964-May 1965.
Investigator(s): Manny Sternlicht, Ph.D., Psychology Consultant, Staten Island Aid for Retarded Children, 1150 Castleton Ave., Staten Island 10, N. Y.
Cooperating group(s): Willowbrook State School.
Publication: Will publish in *American Journal of Mental Deficiency*.

19-HG-8 INCIDENCE AND CHARACTERISTICS OF SPEECH AND LANGUAGE DISORDERS IN AN INSTITUTIONALIZED MILDLY RETARDED POPULATION

Purpose: To discover the incidence of various speech problems, language comprehension, and expression problems, and relate these to the case histories and hearing loss data in this population.
Findings: The data are collected and are being analyzed. The incidence of speech sound difficulties and language deficiencies is high (about 75 percent have sound deficits). The incidence of stuttering is low. Characteristics of voice problems have not yet been analyzed.
Duration: October 1962-continuing.
Investigator(s): John H. Wiley, Ph.D., Associate Professor of Speech Pathology and Chief, Communicative Disorders Division, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, 68105; and Gary H. Jacobs, M.A., Assistant Instructor and Speech Pathologist, Beatrice State Home, Beatrice, Nebr.

19-HG-9 INCIDENCE AND CHARACTERISTICS OF HEARING LOSSES IN AN INSTITUTIONALIZED MODERATELY RETARDED POPULATION

Purpose: To describe incidence and characteristics of hearing loss in all of the moderately retarded patients between the ages of 10 and 20 at the Beatrice State Home.
Methods: Speech and language measures will be carried out. Results of this study will be compared with results of the study on mildly retarded patients, (19-HG-10).
Duration: October 1964-continuing.
Investigator(s): John H. Wiley, Ph.D., Associate Professor of Speech Pathology and Chief, Communicative Disorders Division, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, 68105; and Gary H. Jacobs, M.A., Assistant Instructor and Speech Pathologist, Beatrice State Home, Beatrice, Nebr.

19-HG-10 INCIDENCE AND CHARACTERISTICS OF HEARING LOSS IN AN INSTITUTIONALIZED MILDLY RETARDED POPULATION

Purpose: To determine more accurately the incidence and characteristics of hearing loss in this population, using approaches appropriate to the retarded.
Findings: Partial analysis of the data collected reveals that the incidence of hearing loss in this population is similar to that of the normal population, and that hearing loss does not seem to be an important deterrent to acquiring speech and language for this group.
Duration: October 1962-March 1965.
Investigator(s): John H. Wiley, Ph.D., Associate Professor of Speech Pathology and Chief, Communicative Disorders Division, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, 68105; and Gary H. Jacobs, M.A., Assistant Instructor and Speech Pathologist, Beatrice State Home, Beatrice, Nebr.

19-HG-11 COMMUNICATIVE DISORDERS IN 616 PATIENTS REFERRED AS RETARDED

Purpose: To review incidence and characteristics of communicative disorders

reported in the evaluation of 616 children referred for mental retardation. Findings: Results indicate that communicative problems are very common in this group, and are a common cause for referral. Further analysis is being carried out, leading to revising this report and submitting it for publication.
Duration: February 1964-continuing.
Investigator(s): John H. Wiley, Ph.D., Associate Professor of Speech Pathology and Chief, Communicative Disorders Division, and Nancy A. Timmons, M.A., Assistant Instructor in Speech Therapy and Speech Therapist, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr. 68105.

19-HG-12 PSYCHIATRIC ASPECTS OF MENTAL RETARDATION

Purpose: To determine the types and frequencies of emotional disturbances in a sample of 616 children referred to an evaluation unit as mentally retarded; to clarify differential diagnosis; and to elucidate relationships between emotional disturbances and mental retardation.
Findings: Prominent emotional disturbances were found in one-third of the sample of 616 children: 40 had primary emotional disturbances, 151 had emotional disturbances and were mentally retarded. Various subgroups have been studied separately: 11 mongoloids with prominent emotional disorders, 32 children displaying psychotic reactions, and autistic children. Specific attention has been given to the psychodynamic aspects of personality development of children who are retarded and those who display "pseudoretardation."
Duration: June 1964-continuing.
Investigator(s): Frank J. Menolascino, M.D., Psychiatrist, Children's Service and Mental Retardation Project, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr. 68105.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-HG-13 PSYCHOPHYSIOLOGICAL RESPONSIVENESS, ADAPTATION AND HABITUATION OF NORMALS AND INSTITUTIONALIZED RETARDATES AS A FUNCTION OF STIMULUS INTENSITY AND DURATION

Purpose: To shed light on basic processes in retardates which may underlie the more complex and molar inadequacies that lead to failure in adaptive behavior.
Methods: Normals and retardates were presented with a series of light flashes of two intensities and three durations. Initial arousal, adaptation to single stimuli, and habituation to repeated stimuli were inferred from measures of EEG alpha blocking and GSR latency, alpha blocking and GSR duration, and GSR amplitude.
Findings: Retardates were less responsive on EEG, but more responsive on GSR measures. There was no systematic interaction between intelligence and stimulus intensity or duration. Habituation rates did not differ between intelligence groups. The results are inconsistent with a number of currently prevalent theories of normal-retardate differences.
Duration: July 1962-February 1965.
Investigator(s): Wolf Wolfensberger, Ph.D., Assistant Professor of Medical Psychology and Research Psychologist, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr. 68105.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

19-HG-14 SYMPTOM BEHAVIOR IN RETARDED AND DISTURBED CHILDREN

Purpose: To develop a reliable means of describing the symptom behavior patterns of latency age atypical (retarded, brain-damaged, schizophrenic, behavior disorder) children.
Subjects: Children residing in institutions.
Methods: Behavioral "factors" and patterns of factor scores (through syndrome analysis) will be related to demographic and clinical information. Rater reliability of factor scores will be assessed, as well as the stability of factor scores through time.
Duration: June 1964-June 1966.
Investigator(s): George Spivack, Ph.D., Director of Psychological Research, Devereux Schools, Devon, Pa.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-HG-15 AN INVESTIGATION OF EYE DISEASE IN MENTALLY RETARDED CHILDREN: SURVEY OF OCULAR SYNDROMES IN MENTAL DEFICIENCY

Subjects: Approximately 800 children at Kew Children's Cottages.
Methods: Clinical examination.
Duration: 1964-1968.
Investigator(s): Michael Hugh Mulvihills Ryan, D.O., Opthalmologist, Children's Cottages, Kew, Victoria, Australia.

19-HG-16 PRODUCTIVE THINKING IN RETARDED AND AVERAGE CHILDREN

Purpose: To examine the productive thinking characteristics of mentally retarded and average children; to examine and compare the frequency of productive thinking experiences contained in the discourse of the classroom.
Subjects: Approximately 90 subjects grouped as follows: mentally retarded in regular class; mentally retarded in special class; and average children in regular class.
Methods: Administration of productive thinking tasks including verbal tasks using verbal stimuli, verbal tasks using nonverbal stimuli, and nonverbal tasks. Taping of 45 minutes of selected classroom experiences and evaluating the discourse in relation to Guilford's structure of the intellect.
Duration: September 1964-January 1966.
Investigator(s): John F. Cawley, Ph.D., Associate Professor of Education, University of Connecticut, Storrs, Conn.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-HG-17 PERSONALITY, REINFORCER, SEX, AND SCHEDULE EFFECTS ON RESPONSE RATES OF MENTALLY RETARDED CHILDREN

Purpose: To determine whether children who are described as overconforming by teachers tend to emit more responses in a repetitive, lever-pulling task than underconforming children. In addition, the relative effect of candy as compared to token reinforcers, of increasing variable ratio schedules, and of sex on response rate was examined.
Subjects: 24 mentally retarded children, ages 11 to 16, who were living at home and attending a special school.

Methods: 12 children who were extremely overconforming, and 12 who were extremely underconforming were chosen. Candy reinforcers were M & M's; tokens were beans of similar size to M & M's. Three schedules (VR 8.7, VR 17, and VR 25) were used followed by a period with no reinforcement. Each period was five minutes separated by a 30-second time out. A Dalrymple Discrimination and Differentiation panel was used together with programming, recording, and reinforcing equipment.
Findings: As predicted, overconforming children emitted more responses than underconforming children. In the present design, where only the child's initial reactions to the experimental situation were studied, reinforcer, sex, and schedule effects were not significant.
Duration: April 1963-March 1964.
Investigator(s): A. G. Slemon, Ph.D., Associate Professor, Althouse College of Education, University of Western Ontario, London, Ont.
Cooperating group(s): Department of National Health and Welfare of Canada.
Publication: Article to be submitted for publication following some further analysis of data.

19-HJ-1 LEARNING AND RETENTION IN MENTALLY RETARDED CHILDREN

Purpose: To compare the ability of mentally retarded and mentally normal children to learn and retain verbal paired associates.
Subjects: 96 educable mentally retarded children and 96 mentally normal children.
Methods: Learning and retention characteristics will be investigated as a function of meaningfulness of the paired associates, difficulty level of experimental task, and degree of original learning. Paired-associate learning materials will be made up of two lists each of meaningful and nonmeaningful associate pairs. Subjects will be assigned to minimal or extended learning condition. Paired associates will be learned using the method of adjusted learning. Retention will be tested at 24 hours and five months. Trial-and-error data will be analyzed using a 2 x 2 x 2 x 2 complete factorial analysis of covariance design. Mental Age will be used as covariate in analysis of learning data. Trials to criterion on original learning will be used as covariate in analysis of retention data.
Duration: September 1964-August 1965.
Investigator(s): Herbert J. Prehm, Instructor of Special Education, and James J. McCarthy, Assistant Professor of Education, University of Wisconsin, Madison 6, Wis.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-HJ-2 CLASSICAL CONDITIONING IN RETARDATES AND NORMALS

Purpose: Investigation of basic learning processes in retarded and normal children by use of classical eyelid conditioning techniques.
Subjects: Normal and retarded children.
Methods: Classical eyelid conditioning while subjects are distracted by a motion picture.
Findings: Classical eyelid conditioning techniques may be used with a wide age range of normal and retarded children. Partial reinforcement effects are different in acquisition and extinction for retarded children as compared to the typical results found with college sophomores.
Duration: September 1964-September 1968.
Investigator(s): Leonard E. Ross, Ph.D., Associate Professor, Department of Psychology, University of Wisconsin, Madison, Wis. 53706.

Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication of results is planned in various psychological journals.

19-HJ-3 EFFECTS OF STIMULUS WORD SIMILARITY UPON DISCRIMINATION LEARNING BY TRAINABLE RETARDED CHILDREN

Purpose: To test assumption that the more dissimilar two stimulus words are in appearance, the more readily a discrimination should be made between them; and to determine, for those subjects who mastered the discrimination, if the positive stimulus word would be associated with its pictorial representation.
Subjects: 18 mongoloid and 18 brain-injured, institutionalized, trainable retarded children, without knowledge of word meanings. The M.A. range was 29-63 months.
Methods: Subjects, matched for mental age, were presented with one of three simultaneous word discriminations, all employing CAT as positive stimulus, with CAR, CUP, or PIN as negative discriminanda. Prior to discrimination training, all subjects correctly identified a cat picture. During training, this picture appeared centered above the word stimuli. Subjects received 10 trials a day for 10 days unless they attained an arbitrary criterion of mastery.
Findings: Performance was best on the low similarity (CAT-PIN) discrimination, while subjects receiving the high-similarity (CAT-CAR) treatment demonstrated chance performance. No etiological differences were found. Three of seven subjects attaining criterion responded "cat" when shown the positive stimulus card with picture absent, immediately, one day, and one week following training.
Duration: June 1964-February 1965.
Investigator(s): Richard C. Hall, Ph.D., Psychologist II; Barbara O. Ritter, B.A.; and Joyce A. Houser, A.A., Polk State School and Hospital, Box 94, Polk, Pa. 16342. (Reported by Frank I. Varva, Ph.D., Director of Psychological Services, Polk State School and Hospital.)
Publication: Pennsylvania Psychiatric Quarterly, Winter 1964.

19-HJ-4 EFFECTS OF ACTIVITY LEVEL ON A DELAY OF REINFORCEMENT TASKS IN THE RETARDED

Purpose: To investigate the effects of activity on learning.
Subjects: 30 trainable special education students.
Methods: While performing the two-choice discrimination task under a 12-second delay of candy reinforcement, children were seated in a stabilimetric chair which recorded the gross activity of the child.
Findings: No significant difference found in the mean age and mean mental age of the group which fell in the upper quartile (high active) on the activity measure and the lower quartile group (low active), but the low active group made significantly fewer errors on the discrimination task than the high active group.
Duration: April-June 1965.
Investigator(s): Robert L. Sprague, Ph.D., Research Psychologist, Children's Research Center, University of Illinois, 1007 W. Nevada St., Urbana, Ill. 61801.
Cooperating group(s): Willard School of the Champaign City Schools; National Science Foundation; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Report to be submitted to Journal of Experimental Child Psychology.

19-HJ-5 MOTOR SKILL TRANSFER BY TRAINABLE MENTALLY RETARDED AND NORMAL CHILDREN

Purpose: To determine the learning and retention abilities of trainable mentally retarded children on a specific motor task. The major element of concern was the transferability of training as well as the retention by both the experimental and controls.
Methods: The Turning Test of the Minnesota Rate of Manipulation Test was used for the learning and retention tasks with experimentals and controls. An analysis of covariance was employed to compare the 16 possible combinations for both tasks. Mental age and chronological age were covariates for the learning and retention tasks.
Findings: Trainable mentally retarded children are capable of learning and retaining a motor skill more effectively by transferring an adequate amount of practice of simple component parts of the skill rather than by practice of entire task as a unit. Normal students benefited more from practice of task as a unit than practice of its individual component parts. The pattern of significant results with respect to transfer appears to have been the same when either mental or chronological age was considered as a covariate. Efficiency of transfer and retention is significantly increased by the greater amount of practice for both normals and retardates. Retention and learning are more efficiently achieved when there is more than one factor of training.
Duration: September 1964-June 1965.
Investigator(s): William Hirsch, Ed.D., Principal, Charles Leroy Lowman Elementary School, Los Angeles City Schools, Los Angeles, Calif. (Reported by Ernest P. Willenberg, Ed.D., Director of Special Education, Los Angeles City Schools.)

19-HL-1 DETECTION OF NEW INBORN ERRORS OF METABOLISM IN MENTALLY RETARDED CHILDREN

Purpose: To detect early and treat promptly children with phenylketonuria.
Subjects: Retarded children coming to outpatient department at the University of Wisconsin Medical Center or Central Wisconsin Colony Training School.
Methods: Biochemical screening methods devoted to detection of amino acids, carbohydrates, or unusual chemicals in the urine of research patients.
Findings: Have identified cases of homocystine, Sarcosine, hyperglycinemia, homocitrullinuria, and histidinemia.
Duration: 1957-indefinite.
Investigator(s): Harry A. Waisman, M.D., Ph.D., Professor of Pediatrics, University of Wisconsin Medical Center, and Director, Joseph P. Kennedy Jr. Memorial Laboratories, Madison, Wis.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-HL-2 COMPARISON OF GUTHRIE'S WITH McCAIN AND ROBBINS' METHOD OF PHENYLALANINE ESTIMATION IN SERUM

Purpose: To see if the Guthrie method (on a drop of blood) is sufficiently sensitive for control of treatment in phenylketonuria.
Subjects: Children with PKU.
Duration: 1965-1966.
Investigator(s): David Buxton Pitt, M.D., Pediatrician, Children's Cottages, Kew, Victoria, Australia.

610

19-HN-1 LACRIMAL PROTEINS IN INDIVIDUALS WITH DOWN'S SYNDROME

Purpose: To detect mongolism via chemical analysis of tears.
Subjects: Brain-damaged children and their families, particularly mongoloids.
Methods: Electrophoresis and immuno-electrophoresis.
Findings: The presence of alpha 1 globulin in full-term infants after the first week of life and in premature infants after three to four weeks correlates with Down's Syndrome in over 80 percent of cases. In few hydrocephalic and microcephalics and in some members of the family of mongoloids, the same is found.
Duration: 1961-February 1963.
Investigator(s): Samuel Karelitz, M.D., Chief of Pediatrics, Long Island Jewish Hospital, 270-05 76th Ave., New Hyde Park, N. Y.

19-HN-2 URIC ACID METABOLISM IN MONGOLISM

Purpose: To determine the cause of increased serum uric acid levels in mongoloids.
Subjects: Mongoloid and non-mongoloid residents of the Fort Wayne State Hospital and Training Center.
Methods: Blood and urine analysis, isotope tracer studies, and kidney function tests.
Findings: Urea and creatinine levels as well as uric acid are elevated in the blood of mongoloids compared with non-mongoloids living under the same conditions. Mongoloids may have a kidney defect.
Duration: September 1962-February 1966.
Investigator(s): Edwin T. Mertz, Ph.D., Professor; Dwaine A. Carr, B.A.; Stephen P. Coburn, Ph.D., Head, Department of Biochemistry, Purdue University, Lafayette; and Andrew N. Weber, M.T., Clinical Laboratories, Ft. Wayne State School, Ft. Wayne, Ind.
Cooperating group(s): State of Indiana; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: American Journal of Mental Deficiency 69:814-817, 1965. Another publication now being planned.

19-HN-3 COOPERATIVE STUDY OF DOWN'S SYNDROME

Purpose: To evaluate the possibility of a rapid, simple, inexpensive method to identify translocation mongols.
Methods: Chromosome studies on a large group of mongols will be done to identify a small group of about 10 patients with translocated type. These will be matched with the same number of patients with the common form of mongolism and with mentally retarded patients who do not have mongolism. Patients in the three groups will have careful physical examinations done at Children's Hospital with selected findings reported to the Mental Retardation Branch. They will also have psychological tests, finger and palm prints, photographs, and pelvic x-rays. All data will be assembled and analyzed for differences among three study populations, by the Mental Retardation Branch.
Investigator(s): Richmond S. Paine, M.D., Chief, Section of Neurology, Department of Neurology and Neurosurgery, Research Foundation, Children's Hospital of the District of Columbia, 2125 13th St., N. W., Washington 9, D. C.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

19-HN-4 EPIDEMIOLOGY OF MONGOLISM

Purpose: To compare retrospective information on mongols and control children to determine if significant differences exist, with respect to certain relevant life experiences of their parents, particularly exposure to radiation, reproductive history, surgical and medical history, family history, and occupational history.
Subjects: Mongols 15 years of age and younger registered in Baltimore, Maryland, are included. Controls have been matched to the cases with respect to mother's age and hospital of birth. Rosters have been prepared of a study group of 250 families with a mongoloid child and 250 control families.
Methods: After interviewing parents and review of hospital records, an attempt is made to verify the history of hospitalization, history of family illness, especially cancer, leukemia, mongolism, and congenital defects, by searching hospital records and contacting physicians or others. Mongol children who have died will be included, but results will be analyzed separately.
Duration: 1962-1965.
Investigator(s): Abraham Lilienfeld, M.D., and Arnold T. Sigler, M.D., School of Hygiene and Public Health, Johns Hopkins University, Baltimore; and Simon P. Abrahams, M.D., Assistant Chief for Biomedical Programs, Research Branch, Division of Radiological Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Rockville, Md.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

19-HN-5 A STUDY OF DOWN'S SYNDROME IN YOUNG NEW ZEALAND CHILDREN

Purpose: To note the similarities and differences in a Maori and non-Maori population examined on the Gesell Developmental Schedules; to attempt to show the "normal" curve of development typical to such a population and to point out certain landmarks in their development.
Subjects: This is a comparative study. New Zealand population will be compared with already completed study done by author at Los Angeles Children's Hospital. Age groups one, two, and three years only.
Methods: Gesell Examination as well as other identifying data and measurements, i.e., height, weight, chromosome analysis, etc. This will differ from U. S. study in that it is cross-sectional, whereas the U. S. study was longitudinal.
Duration: 1958-not reported.
Investigator(s): Jack B. Share, Ph.D. Candidate, Department of Education, Victoria University, P. O. Box 196, Wellington, New Zealand.
Cooperating group(s): Los Angeles Children's Hospital Society; Victoria University of Wellington Interdepartmental Grant.
Publication: *American Journal of Mental Deficiency* 66:238, 1961; 68:6, 1964. Other findings will be submitted to *American Journal of Mental Deficiency* and local New Zealand journal.

19-HN-6 THE PREDICTION OF AMENTIA LEVEL IN MONGOLISM

Purpose: To predict maturity level intelligence in mongoloid subjects on the basis of early developmental landmarks.
Subjects: 303 mongoloids.
Methods: Multiple regression analysis of linearized intercorrelations between landmarks and with I.Q. level at maturity.

BEST COPY AVAILABLE

Findings: A useful but limited degree of prediction of maturity I.Q. of mongoloids is possible on the basis of three early developmental landmarks.
Duration: 1964-1966.
Investigator(s): David Gibson, Ph.D., Associate Professor of Psychology, University of Alberta, Calgary, Alta.
Cooperating group(s): Province of Alberta; Department of National Health and Welfare of Canada.
Publication: American Journal of Mental Deficiency.

19-HN-7 DHA EXCRETION IN MOTHERS OF MONGOLS (DOWN'S SYNDROME)

Purpose: To study 11-deoxy 17-ketosteroid urinary excretion levels (particularly DHA) in mothers of mongols.
Methods: The study will correlate the DHA excretion levels with the chromosomal type of Down's syndrome. In those mothers who show elevated DHA, the research will attempt to identify the source of the DHA (adrenal or ovarian); and in those mothers who do not show elevated DHA excretion levels, it will endeavor to see if the ratio of DHA/17-ketosteroids is abnormal after adrenal or ovarian stimulation. Suitable controls are to be studied also in this regard. Chromosomal studies are to be done on all offsprings afflicted with Down's syndrome and on all mothers of mongols less than 29 years of age.
Duration: To be completed September 1966.
Investigator(s): David Solomon, M.D.; and Harold Nitowsky, M.D., Sinai Hospital of Baltimore, Belvedere and Greenspring Ave., Baltimore 15, Md.
Cooperating group(s): National Institute of Arthritis and Metabolic Diseases, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-HN-8 AN ANTHROPOMETRIC STUDY OF ANATOMIC DEVIATIONS IN HANDICAPPED CHILDREN

Purpose: To relate specific structural defects to enzyme defects by means of a developmental approach.
Methods: Graphic plotting of body measurements of handicapped children on standard deviation charts based on 12,000 normal children demonstrates specific anatomic deviations in special groups.
Duration: 1964-indefinite.
Investigator(s): Helen B. Pryor, M.D., Research Associate in Pediatrics, Stanford University, Palo Alto, and Pediatrician, Childrens Hospital, 3700 California St., San Francisco, Calif. (Reported by Hulda Thelander, M.D., Director, Child Development Center, Children's Hospital.)
Cooperating group(s): Palo Alto Medical Research Foundation; March of Dimes; United Cerebral Palsy Association.
Publication: In press: Journal of Pediatrics.

19-HN-9 MONGOLISM WITH A G/G TRANSLOCATION

Purpose: To discover the mode of transmission of hereditable chromosomal defects resulting in mongolism; specifically, the abnormality of G/G translocation is sought for in siblings and parents of individuals with this disorder.
Subjects: Tissue cultures are initiated from blood or tissue of patients with mongolism and their families.

Methods: All patients with mongolism are studied cytogenetically. Of those with translocation forms, the families are studied in an attempt to define the method of transmission and the difference between those which are hereditable and those which are not.

Findings: Of five families studied, four seem to be sporadic while one has been identified in five generations in the same family.

Duration: January 1964-December 1965.

Investigator(s): Harvey S. Rosenberg, M.D., Director of Laboratories, and Shung-jun Yang, Ph.D., Department of Pathology, Texas Children's Hospital, 6621 Fannin St., Houston 25, Tex.

Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: A paper on G/G translocation mongolism is in preparation.

19-HN-10 DOUBLE ANEUPLOIDY--DOWN'S SYNDROME AND MOSAIC TURNER'S SYNDROME IN AN APPARENT MONGOLOID

Purpose: To investigate the presence of double aneuploidy in institutionalized patients.

Methods: An apparently typical mongoloid female was examined karyotypically and was shown to be a mosaic of Turner's Syndrome in addition to Trisomy 21. Exploratory surgery revealed unilateral ovarian stroma.

Findings: This case represents one of the rare occurrences of double aneuploidy. It is presumed that primary nondysjunction in a parental gamete was responsible for the trisomic condition in the patient, and that secondary nondysjunction occurred during the patient's embryogenesis. The finding indicates that factors other than chance may be responsible for chromosomal nondysjunction.

Duration: May 1964-April 1965.

Investigator(s): James D. Eisen, Ph.D., Assistant Professor of Human Genetics, and Chief, Cytogenetic Laboratory, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr. 68105.

19-HN-11 BONE AND SOFT TISSUE DEVELOPMENT IN MONGOLISM

Purpose: To provide information on bone and soft tissue development in mongolism with reference to other significant manifestations of growth.

Subjects: 71 mongols, 39 boys and 32 girls.

Methods: Six years of longitudinal growth data (including soft tissue roentgenograms, bone age, a battery of anthropometric measures, and I.Q. test results) are available on subjects. Patterns of growth of the tissue components in these children will be compared with similar data on normal children. Observations will be made on the impact of puberty and later sexual developmental on physical growth rates and the development of the tissue components in these children. The relationship of the stigmata associated with mongolism to physical growth rates, mental development, and sexual maturation will be investigated. The time of epiphyseal closure in certain of the long bones has been recorded and the sequence of events preceding and following the phenomenon will be reviewed. Both cross-sectional and longitudinal approaches will be used in analyzing the data. The availability of the longitudinal data will permit checking predictions of developmental trends against actual observations.

Duration: Not reported-1967.

Investigator(s): G. Lawrence Rarick, Ph.D., Professor of Physical Education, and Ionel F. Rapaport, Ph.D., Senior Research Scientist, University of

Wisconsin, Madison, Wis.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-HP-1 EFFECT OF REFINED PRESENTATION OF FOOD ON DEVELOPMENT OF VERBAL COMMUNICATION

Purpose: To discover the effect of stimulating reflexes of sucking on possible uses of same structures for speaking.
Subjects: Patients at Pacific State Hospital.
Methods: Training all nursing personnel and patient feeders in method of presenting food in small amounts at the lips. Anecdotal evaluation.
Duration: 1960-1970.
Investigator(s): Irene Blanchard, Ph.D., Specialist in Communication, School Department, Pacific State Hospital, California State Department of Mental Hygiene, Box 100, Pomona, Calif.

19-HP-2 RESEARCH IN REMEDIAL GUIDANCE OF YOUNG RETARDED CHILDREN WITH BEHAVIOR PROBLEMS WHICH INTERFERE WITH ACADEMIC LEARNING AND ADJUSTMENT

Purpose: To analyze importance of social consequences of severe problem behavior by experimental analysis in a day care situation; to refine techniques for modification of socially unacceptable behavior problems; and to evaluate effects on child's behavior at home after parents have been trained in handling the problem consistent with behavioral principles.
Subjects: Young, noninstitutionalized retarded children, ages 3 to 10 years.
Methods: Laboratory experiments and field experiments, utilizing a laboratory setting and a nursery school setting.
Duration: September 1965-May 1966.
Investigator(s): Sidney W. Bijou, Ph.D., Professor of Psychology and Director, Program on Human Development Research, and Howard N. Sloane, Ph.D., Research Assistant Professor, University of Illinois, Urbana, Ill.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Numerous publications (list available from Children's Bureau Clearinghouse or from principal investigator.)

19-HR-1 ASSESSMENT OF VOCATIONAL REALISM IN EDUCABLE MENTALLY RETARDED ADOLESCENTS

Purpose: To determine how realistic mentally retarded adolescents nearing the terminal point in their formal education are regarding the jobs they think they can obtain when leaving school.
Subjects: 886 mentally retarded adolescents in high school special training classes.
Methods: Direct interview with each subject; collection of data from school records; and teacher and administrator interviews.
Duration: January 1964-December 1965.
Investigator(s): Molly C. Gorelick, Ed.D., Chief of Guidance Services, Exceptional Children's Foundation, 2225 W. Adams Blvd., Los Angeles, Calif. 90018.
Publication: Journal article planned.

19-HR-2 SOCIAL-PERCEPTUAL TRAINING FOR THE VOCATIONAL REHABILITATION OF MENTALLY RETARDED ADOLESCENTS

Purpose: To improve the social perceptions, inferences, and, most essentially, the behaviors of the mentally retarded adolescent in social situations, thus better to equip him for successful membership in social and vocational peer groups.
Subjects: Four classes of mentally retarded junior high school pupils and four vocational training classes of residential (state institutionalized) retardates will be involved in evaluation of the training program, with two classes of both public school and residential retardates serving as disguised controls.
Methods: Development and testing of experimental procedures for training social-perceptual skills. Experimental training procedure will be evaluated in terms of a pair of controlled studies permitting pre- and post-training measurement of social-perceptual acuity and interpersonal behaviors of all subject groups. Measures of social-perceptual acuity--rate, comprehensiveness (inclusion of relevant social cues), and accuracy (appropriateness of interpretations)--are to be derived from a standardized presentation of picture stimuli covering a wide range of social situations pertinent to retarded youth.
Duration: Not reported-December 1966.
Investigator(s): Barbara Turner Edmonson, M.A., Research Associate; Norris G. Haring, Ed.D., Director of Education, Children's Rehabilitation Unit, University of Kansas Medical Center, Kansas City; and John E. deJung, Ed.D., Research Associate, Bureau of Child Research, University of Kansas, Lawrence, Kans.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

19-HR-3 INFLUENCE OF OCCUPATIONAL INFORMATION COUNSELING ON REALISM OF OCCUPATIONAL ASPIRATIONS OF MENTALLY RETARDED HIGH SCHOOL BOYS

Purpose: To establish the value of occupational information as a means of creating a realistic approach to occupational goals among mentally retarded senior high school boys.
Subjects: 7 experimental and 6 control groups of mentally retarded high school boys.
Methods: Six of the experimental groups receive occupational information bi-weekly, the seventh group receives both occupational information and on-the-job training; control groups receive neither. Statistical analysis will show the presence or absence of significant difference in occupational goals and realism of occupational aspirations between experimental and control groups, as well as a relationship between the occupational goals of the experimental and control groups when influence of other variables (I.Q. and socio-economic status) has been eliminated.
Investigator(s): George A. Jeffs, Ph.D., Assistant Professor of Secondary Education, and Lillian Barnum, College of Education, University of Nevada, Reno, Nev.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

19-HR-4 INTEGRATION OF EDUCABLE RETARDATES IN NORMAL GROUPS

Purpose: To find out to what extent clinically diagnosed educable mentally retarded children can be helped to participate in group activities designed

for normal children; to learn the demands each type of group places on an individual member, and personality and physical characteristics necessary for a member to achieve full participation; to learn the kinds of satisfactions and frustrations the retarded child and his parents experience as he is exposed to interaction with his normal peers; and to determine the administrative arrangements and in-service training an agency must provide to accomodate such children.
Subjects: 30 educable mental retardates previously members of agency; 64 educable mental retardates newly applying to agency; 64 normal controls.
Methods: Intensive case study of each subject and control; development of criteria for placement, with rating scales; participant observation of groups with structured reporting to be converted to ratings; critical incident reporting by leaders; reporting of behavior by school teachers; supervisory reports of technical problems; agency staff reports of agency member response; and use of computer analysis whenever applicable.
Duration: June 1965-May 1970.
Investigator(s): Muriel W. Pumphrey, D.S.W., Associate Director, Social Science Institute, Washington University; and Mortimer Goodman, M.S.W., Director, Adult Services, Jewish Community Centers Association, St. Louis, Mo.
Cooperating group(s): Special District for the Educating and Training of Handicapped Children of St. Louis County, Missouri; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal articles will be offered to social work publications and to journals dealing with education and care of retardates. A monograph analyzing the agency's previous experience to be completed in the spring of 1965.

19-HR-5 GRADUATED HABILITATION OF MENTALLY RETARDED YOUTH, 1963-1966

Purpose: To observe closely a sample of male students going through the process of moving from an institutional environment into an independent living situation; to better appreciate the adjustment process experienced by retarded individuals as they go through placement; and to discover those students requiring supplementary assistance through resources both on and off campus.
Methods: Half the sample will be afforded a "stepping stone" via the halfway house. Control group will remain in institution until placement can be effected, moving individual directly into independent living situation in the community. Sample is limited in size to permit detailed observation of both groups and intensive analysis of each individual's progress.
Investigator(s): Joseph J. Parnicky, Ph.D., Superintendent, and Neale L. Peterson, M.S., Supervisor of Instruction, E. R. Johnstone Training and Research Center, Bordentown, N. J. 08505.
Publication: Welfare Reporter 15:4:124-128, 1964.

19-HT-1 A HABILITATION PROGRAM FOR THE SEVERELY RETARDED

Purpose: To evolve new, more effective techniques for helping profoundly retarded children develop greater self-reliance in such basic abilities as eating, communication, oral hygiene, grooming, bathing, dressing, toilet training, and physical and social dexterity.
Subjects: 160 ambulatory children, profoundly retarded, institutionalized, between the ages of 6 and 12.

Methods: New vocational skills will be introduced on wards by employed nursery school teachers and a physical education instructor, in addition to psychiatric technicians. Patients will be divided into small groups of 10 to 12, which will be cared for by the nursery school teacher or psychiatric technician, a child care specialist. The child care specialist will be assisted by a volunteer who can provide each child with a one-to-one relationship for part of the day, and a patient model who has acquired the self-help skill and can demonstrate it to severely retarded child.
Duration: 1964-1967.
Investigator(s): George Tarjan, M.D., Superintendent and Medical Director; Charles V. Keeran, Jr., M.S.W., Administrative Assistant; Anna M. Shotwell, Ph.D., Chief Psychologist; and Arthur B. Silverstein, Ph.D., Research Psychologist, Pacific State Hospital, California State Department of Mental Hygiene, P.O. Box 100, Pomona, Calif.

19-HT-2 COMMUNITY TRANSITIONAL ADJUSTMENT PROGRAM FOR MENTAL RETARDATION

Purpose: To improve methods of treatment and education of brain-damaged, emotionally disturbed, and mentally retarded children in a state institution, the major area of deficiency being the lack of continuum between treatment, special education, vocational training, and community transition.
Methods: A program of community transition starting with pre-vocational education and working through discharge, by adding to hospital staff individuals expert in areas of educational and vocational research and training, and by establishing a workshop and socialization program as a demonstration, testing feasibility of procedures.
Duration: Not reported-1969.
Investigator(s): Howard V. Bair, M.D., Superintendent and Medical Director, and Joseph E. Spradlin, Ph.D., Coordinator of Research, Parsons State Hospital and Training Center, Parsons, Kans.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-HT-3 SOME POSSIBLE EFFECTS OF DIFFERENTIAL EXPERIENCES ON RETARDED PERSONS LIVING IN VARIED RESIDENTIAL CENTERS

Purpose: To examine daily living experiences of mentally retarded children in residential centers, and to relate these experiences to changes in behavior.
Subjects: 225 mentally retarded children in six different institutions.
Methods: Detailed observation of individual child. Four research workers are being trained to record their observations on a specially designed schedule. Study is divided into two parts: a two-year follow-up of children to be transferred to a new, small institution; and retrospective comparisons with children who had been transferred to a small institution four years ago. Measures of intelligence, social maturity, and attitudes will be used.
Duration: July 1965-July 1968.
Investigator(s): M. Michael Klaber, Ph.D., Director, Mental Retardation Project, University of Hartford, Hartford, Conn. 06117.
Cooperating group(s): Office of Mental Retardation, Connecticut State Department of Health; Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

19-HT-4 DEVELOPMENT BEHAVIORAL RATING SCALE FOR HOSPITALIZED MENTALLY RETARDED PATIENTS

Purpose: To develop an inventory which can be used by aide and nursing personnel to appraise manifest adjustment in areas of physical self-sufficiency, general adjustment, activity, and contribution; and to describe distribution of nursing care problems in various residential facilities.

Subjects: 1908 patients at a state residential facility for the mentally retarded.

Methods: Patients were rated by two aides on a 42-item inventory. 32 items were utilized from Nebraska Patient Inventory which had been used to evaluate almost the entire population (N=3704) in the three state psychiatric hospitals in Nebraska.

Findings: Reliability studies indicated highest degree of agreement was obtained on physical care and physical self-sufficiency items. Items dealing with social and personal adjustment had only moderate reliability. Comparisons of distribution of nursing care problems in mentally retarded population and psychiatric populations were carried out. Sample findings were: significantly greater number of nursing care problems in all areas of physical self-sufficiency in mentally retarded population; much greater utilization of medication in psychiatric populations; and greater proportion of individuals with full-time work assignments in retarded population.

Duration: October 1963-continuing.

Investigator(s): Dean C. Affleck, Ph.D., Associate Professor of Medical Psychology, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr. 68105.

19-HT-5 EX-INMATES OF WERRINGTON PARK IN THE COMMUNITY

Purpose: To obtain a detailed picture of how ex-inmates of Werrington Park fared in the community. Werrington Park is an establishment for intellectually-handicapped boys 14 to 18 years of age, who are cared for in three cottages of 30 boys each.

Subjects: 50 percent of all boys discharged since the opening of Werrington Park in 1955 (45 boys with ages on discharge ranging between 15 and 18 years.)

Methods: Completion of detailed questionnaire by personal interview and observation; a number of variables isolated and their interreaction examined statistically.

Findings: In general, boys were readily divided into two groups: (1) those who lived with parents or other family; and (2) those, having no family, who cared for themselves. The former tended to be apathetic, of little community value (did not work), but reasonably happy. The latter were of community value in that they worked consistently, but tended to be lonely and unstable. A number of other trends were isolated.

Duration: January-May 1965.

Investigator(s): New South Wales Department of Child Welfare and Social Welfare, William and Yurong Sts., Sydney, Australia.

19-HT-6 PROGRAM DEVELOPMENT FOR INSTITUTIONALIZED MENTALLY RETARDED CHILDREN

Purpose: To systematically apply sensorimotor and "group-living" procedures to young institutionalized mentally retarded children, and to assess the effects of this type of treatment.

Subjects: 60 institutionalized, mentally retarded children, from infancy to

three years of age, divided into three experimental groups and one control group.
Methods: First experimental group receives sensorimotor training; second group receives "group-living" procedures; and third receives both sensorimotor and "group-living" procedures. Control group receives only the standard institutional care, with equal experimenter's time to counteract Hawthorne effect. Treatment period is 30 minutes per day, with time of day randomized. Study will run for eight months on a seven-day per week basis. Index measures will be taken before, during, and following treatment.
Duration: September 1964-September 1967.
Investigator(s): James J. McCarthy, Ph.D., Assistant Professor of Education, Herbert J. Prehm, Instructor of Special Education, University of Wisconsin; and Harvey A. Stevens, Superintendent, Central Wisconsin Colony and Training School, 317 Knutson Dr., Madison, Wis.

19-HW-1 EFFECTS OF THE CHILD'S DEFICIENCY ON THE FATHER: A STUDY OF FATHERS OF MENTALLY RETARDED, CHRONICALLY ILL, AND NEUROTIC CHILDREN

Purpose: To study effects upon personalities of fathers of having a child who is deficient in health and/or adaptive competence.
Subjects: 192 fathers, 48 each of mentally retarded, chronically ill, neurotic, and healthy control children; equal age groups (4 to 8, 9 to 13) and sex groups.
Methods: Three questionnaires and sentence completion test.
Duration: February 1965-June 1966.
Investigator(s): S. Thomas Cummings, Ph.D., Associate Professor of Psychiatry, University of Chicago, Chicago 37, Ill.
Cooperating group(s): Illinois State Department of Mental Health.
Publication: Plan to submit to child clinical journal.

19-HW-2 PARENTS OF SUSPECTED RETARDATES: THEIR PATTERNS, ADJUSTMENTS, AND EXPECTATIONS

Purpose: To analyze reactions of 472 sets of parents who brought their children to an evaluation clinic because of suspicion of mental retardation.
Findings: Results are tentative. Most parents carry on a verbal "free exchange" of ideas when discussing the child; most are seeking information about the child's future development; since the birth of the child, more families are less cohesive than more cohesive; many mothers pay less attention to their other children since the child's birth; many parents have withdrawn from community interactions.
Duration: November 1964-continuing.
Investigator(s): Richard A. Kurtz, Ph.D., Assistant Professor of Medical Sociology, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr. 68105.

Emotional disturbances

19-IA-1 EMOTIONAL HANDICAP IN THE ELEMENTARY YEARS: PHASE OR DISEASE

Purpose: To assess reliability and validity of a modified and abbreviated

form of Bower-Lambert process for in-school screening of emotionally handicapped children; and to study prevalence and time course of emotional handicap and its impact on child's academic progress.
Subjects: Children enrolled in grades 4, 5, and 6 in a typical, rural, northern Minnesota school district.
Methods: Preparation of academic progress charts and special keysort cards on all elementary children in school district; repeated screenings with modified Bower-Lambert method and follow-up interviews with students' teachers.
Findings: About 5 to 10 percent of elementary school children have adjustment difficulties of sufficient severity to warrant professional attention. Screening devices are adequate to the task. A significant number of children identified as emotionally handicapped do not resolve their problems without help. For this group "emotional handicap" is a disease and not a phase. The emotionally handicapped youngster gets progressively farther behind his peers academically as he moves through the elementary years.
Duration: 1961-1965.
Investigator(s): Richard G. Stennett, Ph.D., Clinical Psychologist, Northland Mental Health Center, Inc., Grand Rapids, Minn.
Cooperating group(s): Minnesota Mental Health Association; C. K. Blandin Foundation; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Submitted to American Journal of Orthopsychiatry.

19-IA-2 IDENTIFICATION OF EMOTIONAL DISTURBANCE IN YOUNG SCHOOL CHILDREN

Purpose: To test validity of a questionnaire to be completed by classroom teacher as a screening instrument for detection of emotionally disturbed children who need professional help beyond resources of the school.
Subjects: 1,000 school children in grades one through four; 200 will be used as controls.
Methods: There is wide difference of professional opinion as to whether the teacher is an adequate casefinder of emotional disturbance in children. There is not in existence a valid, simple, inexpensive device for such casefinding. Teacher will complete a simple questionnaire on subjects and will refer those screened out (an estimated 100) to an examining pediatrician and a psychologist. Sensitivity and specificity rates will be computed to determine accuracy of questionnaire in hands of teacher as a screening tool.
Duration: June 1965-December 1966.
Investigator(s): Virginia McNamara, M.D., M.P.H., Director, School Health Service; and William F. Castellow, M.D., District Director of Public Health, Georgia State Department of Public Health, Atlanta, Ga. 30334.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-IA-3 FOLLOW-UP STUDY

Purpose: To study a variety of problems in the development of psychopathology: kinds and degrees of early psychopathology and the kinds and degree they lead to later on; kinds with the worst prognosis; dominant male and female kinds; and crystallized symptoms which appear or disappear in development.
Subjects: Children from prenursery and therapeutic nursery, ages two and three, current cases as well as records of past; children from ordinary nursery school as controls.

621

Methods: A developmental Q-sort is applied to 20 record cases, 20 controls, and to current cases in the phallic phase (3 to 4.5); a symptom list adapted from Rosenfeld's latency list for the nursery group is applied to the same sample; a developmental scale is also being developed.
Duration: December 1963-not reported.
Investigator(s): Frances Fuchs Schacter, Ph.D., Child Development Center, 120 W. 57th St., New York, N. Y.
Cooperating group(s): Downtown Community Nursery School; Ehrmann Foundation.

19-ID-1 ADOLESCENT MATRICIDE

Purpose: To understand the psychic determinants of three cases of matricide committed by adolescents.
Subjects: Three adolescents, two boys and one girl.
Methods: Clinical case study.
Findings: No "syndrome" has been established, as the motives and character structure of the three children differ markedly. However, in the one case that is best understood, the crime appears to have resulted from a combination of an intense, mutually-supported, lifelong sado-masochistic interaction between mother and child, and community compliance.
Duration: 1961-continuing.
Investigator(s): Donald J. Scherl, M.D., (formerly) Fellow in Child Psychiatry, and John E. Mack, M.D., Senior Staff Psychiatrist, Child Psychiatry Unit, Massachusetts Mental Health Center, Boston, Mass. 02115. (Reported by Gregory Rochlin, M.D., Director, Child Psychiatry Unit.)
Publication: Paper describing one boy in detail to be submitted to the *Journal of the Academy of Child Psychiatry*.

19-ID-2 INCIDENCE AND ETIOLOGY OF PSYCHOLOGICAL DIFFICULTIES IN ADOPTED CHILDREN

Purpose: To test validity of published claims that adopted children are subject to more difficulties than nonadopted children; and to explore the etiology of difficulties and to attempt to verify several hypotheses involving both psycho-dynamic and family structure variables.
Methods: A sample of adopted and nonadopted children will be investigated with regard to frequency of various symptoms of difficulties. "Difficulties" are defined very broadly to include a range from reading and learning problems to minor behavior disturbances, from asthma to accidents and obesity, and from psychiatric problems to delinquency. Data will be collected from records and by interview.
Duration: 1962-1967.
Investigator(s): H. David Kirk, Ph.D., Department of Sociology, University of Waterloo, Waterloo, Ont.; and Kurt Jonassohn, M.A., Department of Sociology, Sir George William University, Montreal, Que.
Cooperating group(s): Foundations' Fund for Research in Psychiatry.

19-ID-3 AN EVALUATION OF THE EFFECTS OF EMOTIONAL TRAUMA ON THE DEVELOPMENT OF CHILDHOOD PSYCHOSIS

Subjects: 30 normal children, 20 psychotic children, and 20 children resident in an institution as wards of private and state agencies.
Methods: Measurements of pupillary reactivity as an index of autonomic

balance will be obtained on subjects.
Investigator(s): Leonard S. Rubin, Ph.D., Senior Scientist III, Eastern Pennsylvania Psychiatric Institute, Henry Ave. & Abbottsford Rd., Philadelphia 29, Pa.
Cooperating group(s): Pennsylvania State Department of Public Welfare.

19-ID-4 FAMILY DEPRIVATION AND CHILD HEALTH: A STUDY OF 10 YEARS' ADMITTANCES TO A CHILDREN'S RESIDENTIAL TREATMENT CENTER FOR EMOTIONAL ILLNESS

Subjects: Total population of children at a residential treatment center.
Methods: Survey focused upon child and family factors associated with admittance for treatment.
Findings: While family deprivation and inadequacy were frequently encountered, maternal deprivation was invariable. Children most seriously deprived appeared to have a higher rate of physical, emotional, and psychosomatic disorders, including school performance. Developmental and emotional abuse appeared to be more significant than physical abuse from the families of this group of children.
Investigator(s): Roger J. Meyer, M.D., Associate Professor of Pediatrics and Preventive Medicine, and C. Ponee, M.S.W., University of Virginia Hospital, Charlottesville, Va.

19-IG-1 AN INSTRUMENT TO EVALUATE AUTISTIC CHILDREN

Purpose: To develop an instrument which can evaluate the status of autistic children and measure the nature and extent of change in their behavior.
Subjects: 80 autistic children.
Methods: On the basis of five years of clinical experience, a research team constructed an instrument which is objective and reliable, and which reflects the complexity of the autistic child's observed behavior. Instrument consists of four core scales which evaluate relationship, mastery, communication, and psychosexual development. Three supplemental scales evaluate social development, intellectual development, and vocalization.
Duration: 1961-not reported.
Investigator(s): Charles Wenar, Ph.D., Associate Professor; Bertram A. Ruttenberg, M.D.; Mitchell L. Dratman, M.D.; and Julia Fraknoi, Ph.D., Department of Psychiatry, University of Pennsylvania School of Medicine, Philadelphia, Pa.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: A paper describing the instrument in detail has been submitted for publication.

19-IG-2 OPERANT BEHAVIOR OF AUTISTIC CHILDREN

Purpose: To find out how readily autistic children can learn various schedules of reinforcement; and to learn something about their perception of color and form.
Subjects: Currently five autistic children, ages 7 to 11.
Methods: Operant conditioning techniques. The children are started on continuous reinforcement and then moved to fixed ratio, progressing to fixed ratio 100. They are placed on fixed interval and last a DRL schedule.
Findings: The children progress quite rapidly from candy reinforcement to

tokens that are exchanged for various items such as candy and toys. They have little difficulty discerning one schedule from another.
Duration: June 1965-indefinite.
Investigator(s): Marjorie Clos, Ph.D., Research Director, and Michael Einbund, B.S., Research Student, Central Hospital, Louisville, Ky. 40223.

19-IG-3 LEARNED COOPERATION IN THE BEHAVIORALLY-DISTURBED BOY

Subjects: Boys, between the ages of 8 and 14, attending a summer camp for behaviorally-disturbed boys.
Methods: Cooperative behavior will be rewarded over a series of experiences in a game-playing situation which will require that individual responses interlock to win. The game will be played at a table with players sitting face-to-face. The extent to which cooperation thus established is later generalized will be assessed in a second quite different game situation (volleyball). Critical a- or antisocial behaviors manifested in the latter situation will constitute the criteria.
Investigator(s): Paul S. Siegel, Ph.D., Professor of Psychology, and Henry C. Rickard, Ph.D., Assistant Professor of Psychology, University of Alabama, University, Ala.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-IG-4 SOME CORRELATES OF PERSONALITY DISORDER AND CONDUCT DISORDER IN A CHILD GUIDANCE CLINIC SAMPLE

Purpose: To derive correlates of Peterson scale and parent-teacher ratings of clinical sample.
Subjects: 79 child guidance clinic cases.
Methods: Questionnaire for parents and teachers, and usual diagnostic procedures.
Duration: May 1962-November 1964.
Investigator(s): Herbert C. Quay, Ph.D., and Robert L. Sprague, Ph.D., Department of Psychology, University of Illinois, Urbana; Arnold L. Miller, Ph.D., Clinical Psychologist, and Harold S. Shulman, Ph.D., Chief Psychologist, Champaign City Mental Health Clinic, 501 E. Springfield, Champaign, Ill.
Cooperating group(s): Champaign-Urbana School System.
Publication: *Journal of School Psychology*.

19-IG-5 CHILDHOOD AND ADULT LIFE EXPERIENCES AS CORRELATES OF ANOMIE

Purpose: To investigate the relative importance of childhood experiences in developing anomie or social disorganization.
Subjects: Males and females from preschool age to late adulthood; juvenile delinquents.
Methods: Questionnaires and interviews to assess childhood experiences.
Findings: Anomie is related, predictably, to childhood experience memories. Experiences that are not conducive to the development of culturally acceptable goals and values are related positively to anomie. Sex differences and relationships to father, mother, brother, and sister differences exist.
Duration: October 1963-June 1966.
Investigator(s): Gunars Reimanis, Ph.D., Chief, Research Psychology Unit,

Veterans Administration Center, Bath; and Professor of Psychology, Corning Community College, Corning, N. Y.
Cooperating group(s): Veterans Administration.
Publication: Journal of Genetic Psychology 106:245-252, 1965; further publication planned. A summary of findings will be available from Bath Veterans Administration Center.

19-IG-6 COOPERATIVE RESEARCH ON JUVENILE SUICIDE AND ITS PREVENTION

Purpose: To discover why the rate of juvenile suicide in Japan is very high in comparison with the rate of juvenile suicide in other countries.
Methods: Statistical study of juvenile suicide; clinical study of juveniles who attempted suicide; socio-psychiatric study of juvenile suicide and attempted juvenile suicide; psychology and psychopathology of child suicide; the suicide of juvenile delinquents; and the prevention of juvenile suicide.
Duration: April 1963-1964.
Investigator(s): Professor S. Yoshimasu, General Institute of Legal Medicine, Tokyo Medical and Dental University, 3, Yushima, Bunkyo-ku, Tokyo, Japan. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Summer 1964.)
Cooperating group(s): Central Council on Juvenile Problems, Office of the Prime Minister, Japan.

19-IJ-1 DEMONSTRATION BEHAVIOR DISORDER PREVENTION PROGRAM

Purpose: To establish a program to prevent the development of a specific behavior disorder, enuresis, in a population of children through the use of a special training device; to help evaluate program effectiveness, present study observed changes in the enuresis under the training device, under psychotherapy, and in an untreated control group.
Subjects: 140 enuretic children, boys and girls aged 9 to 11, referred to clinic by their parents.
Methods: 100 children were assigned to a bell training device group, 20 children to psychotherapy, and 20 children to an untreated control group. For the first group, training was terminated after 90 days of treatment or 14 successive days of no wetting; for the second group psychotherapy was given on a once-a-week basis for 90 days and then terminated; and for the third group no treatment was given. For all groups the frequency of bed wetting was recorded several weeks prior to, during, and at termination of treatment. Personality, behavior, and enuresis evaluation is made prior to treatment and one month, six months, and one year following termination of it.
Duration: May 1964-October 1965.
Investigator(s): Richard M. Silberstein, M.D., Director, and Wallace Mandell, Ph.D., Director of Research, Staten Island Mental Health Society, Inc., 657 Castleton Ave., Staten Island 1, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-IM-1 AN INVESTIGATION OF PSYCHOSIS IN CHILDHOOD

Purpose: To determine those manifestations that are fundamental to what is meant by "psychosis" when dealing with children in order to contribute to

diagnostic clarity in this field.
Subjects: 50 children in the Child Psychiatry Unit of the Massachusetts Mental Health Center.
Methods: Questionnaires, case study, and interviews of staff.
Findings: Conceptual confusion as well as substantive disagreement is marked in this field. Fundamental to all preadolescent children designated "psychotic", regardless of subclassification, are manifestations indicating bizarreness, marked disturbance of the child's relation to reality, and severe disturbance of object relations.
Duration: 1963-continuing.
Investigator(s): John E. Mack, M.D., and Donald S. Gair, M.D., Senior Staff Psychiatrists, Child Psychiatry Unit, Massachusetts Mental Health Center, Boston, Mass. 02215. (Reported by Gregory Rochlin, M.D., Director, Child Psychiatry Unit.)
Publication: Paper, "An Investigation of the Concept of Psychosis in Childhood," presented at the Seventh Annual Research Conference of Harvard Department of Psychiatry, June 25, 1965.

19-IM-2 A STUDY OF PSYCHOTIC ILLNESS IN CHILDHOOD

Purpose: To assess available diagnostic criteria and classifications and to present a practical method of both at the clinical level; and to investigate toxicity of body fluids.
Subjects: 20 psychotic children; follow-up of hypotheses on 56 psychotic children.
Methods: Admission to hospital for psychiatric, psychological, and physiological assessment; factor analyses on rating data obtained; and biological experiments on test animals using "seizure" pattern as index of toxicity.
Findings: Statistically significant results on increased toxicity in cerebrospinal fluid, serum, and urine of psychotic children.
Duration: January 1963-January 1965.
Investigator(s): Stanley Gold, M.B., D.P.M., Research Fellow, and G. F. Vaughan, M.R.C.P., D.P.M., Research Unit, Guys Hospital, London S.E.1, England.
Publication: Findings will be published as a thesis at the University of Melbourne and as articles in the medical and psychiatric literature during 1965.

19-IP-1 A LONGITUDINAL STUDY OF ADULT SCHIZOPHRENIA

Subjects: 325 persons who were seen in childhood or adolescence at the Judge Baker Child Guidance Center and who were hospitalized and diagnosed schizophrenic as adults. Matched control cases, drawn from the 18,000 children who have been seen at the Center and who have escaped hospitalization will be compared with the schizophrenics.
Methods: Comparisons will be made between the schizophrenic sample and patients hospitalized for character disorders and for depression. Comparisons within the schizophrenic sample will be made between chronic and released patients, males and females, those whose symptomatology was manifested early in life and those whose early lives appeared less disturbed. The three main areas of study will be: (1) hereditary history and family patterns; (2) early developmental patterns; and (3) outcome of illness.
Duration: 1964-1967.
Investigator(s): David F. Ricks, Ph.D., Research Psychologist; Mary L. Waring, M.S.W., Social Service; and Gene Nameche (Ph.D. Candidate, Brandeis

University), Judge Baker Guidance Center, 295 Longwood Ave., Boston 15, Mass.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-IP-2 RESEARCH AND TREATMENT FOR SCHIZOPHRENIC CHILDREN

Purpose: To contribute to knowledge of schizophrenic children falling in two categories: autistic and symbiotic.
Subjects: Initially a maximum of 15 children, aged 6 to 10 years.
Methods: The plan is to establish a treatment center in a public school carefully chosen for its understanding personnel. Selection of subjects would be based on physical, psychological, psychiatric, and case study information; parents as well as children would be evaluated. A classroom teacher selected for appropriate experience and personality traits would offer a highly structured program of varied activities as suggested by existing research. Other personnel would be brought in as needed. Treatment would be provided by a Mental Health Clinic staff member, and parents would participate in group therapy. A clinic team working closely with the teacher would evaluate the children and their families at least twice a year, and results would be assessed in deciding whether to shift children in regular classrooms, continue them, or discontinue them in the treatment center. The program would be integrated with regular school as much as possible.
Investigator(s): Lewis C. Martin, Ph.D., Coordinator, and Margie R. Lee, M.A., Consultant, Division of Mental Health, Multnomah County Division of Public Health, Health and Education Building, 12240 NE Glisan St., Portland, Oreg. 97230.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-IS-1 RESEARCH IN FAMILY THERAPY

Purpose: To determine the effectiveness of family therapy as a method of treating disturbed relationships between children and their parents.
Methods: Clinical and experimental methods with sample of families who present problems with children.
Duration: September 1963-September 1965.
Investigator(s): George Thorman, M.A., Research Director; Marjorie Eaton, A.B.; Karen Buckman, M.A.; and Thomas Biever, M.A., Caseworkers, Family Service Association, 615 N. Alabama St., Indianapolis 4, Ind. (Reported by Henry M. Graham, M.S.W., Executive Director, Family Service Association.)
Publication: To be made available in mimeograph form; probable publication in June 1965.

19-IV-1 APHASIA AND EMOTIONAL DISTURBANCE

Purpose: To remedy lack of communication among many students classified as emotionally disturbed.
Subjects: 12 students in sixth grade, followed through seventh and eighth grades.
Methods: Field trips, and parent conferences.
Findings: Insulted self-concept; lack of confidants; fear and self-distrust;

and social isolation.
Duration: 1964-1966.
Investigator(s): Ann Reid, Ed.D., Coordinator of Special Education, Bryan School, 1134 NW 8th St., Oklahoma City, Okla.
Publication: Available from Oklahoma City Public Schools.

19-IV-2 FAMILY THERAPY OR CHARACTER THERAPY

Purpose: To determine importance of character development in a family setting upon various psychopathologies and schizophrenia, paranoid difficulties, psychoneurotic problems, developmental and personality problems.
Subjects: Children and their parents.
Methods: Clinical findings, attention to the development of family character with multiple therapists serving as parent-substitutes. It seems more helpful in the treatment of schizophrenic, paranoid, and personality disorders than the primary psychodynamic psychotherapies.
Duration: 1948-1966.
Investigator(s): Christian F. Midelfort, M.D., Medical Director; Mary E. Fontaine, M.S.W., Chief Psychiatric Social Worker; and Fred DeWit, Ph.D., Chief Psychologist, LaCrosse County Guidance Clinic, 419-21 Main St., LaCrosse, Wis.

19-IV-3 EFFECTS OF CHANGE IN FREQUENCY OF PSYCHOTHERAPY ON PSYCHOLOGICAL FUNCTIONING OF CHILDREN

Purpose: To investigate effects on the child's psychological functioning of changing the frequency of his psychotherapeutic sessions.
Subjects: Two children with learning disturbance, and their families.
Methods: The plan is to initiate treatment with subjects on a once-a-week basis and then increase the frequency with which the child is seen to four times a week after about a year. Independent observations of the sessions will be made through the use of a one-way screen. The nature of the sample has been carefully delineated and methods for collecting and analyzing the data are available.
Investigator(s): Christoph M. Heinicke, Ph.D., Senior Research Psychologist; Mortimer Meyer, Ph.D., Chief Clinical Psychologist; Rocco L. Motto, M.D., Director; Marshal Wheeler, Ph.D., Psychologist; and Bernice T. Eiduson, Ph.D., Director of Research, Reiss-Davis Clinic for Child Guidance, 9760 West Pico Blvd., Los Angeles, Calif. 90035.
Cooperating group(s): The Grant Foundation.

19-IV-4 WORK REHABILITATION FOR SEVERELY DISTURBED ADOLESCENTS

Purpose: To demonstrate a therapeutic rehabilitation program in the community for severely disturbed adolescents between the ages of 16 and 21, living at home, and unable to profit from continued schooling or to pursue gainful employment.
Methods: Structured group and individual ego-strengthening experiences utilizing clinical-vocational-education team, leading to successful employment.
Investigator(s): Gertrude K. Berman, B.S., Administrative Director; Jacob E. Slutzky, Ph.D.; Irving Chipkin, M.D., Psychiatrist; and Jack L. Herman, Ph.D., Psychologist, Luther E. Woodward School for Emotionally Disturbed

Children, Inc. (formerly The Berman School, Inc.), 66 S. Grove St., Freeport, N. Y. 11520.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-IV-5 DEVELOPMENT OF A DAY TREATMENT CENTER FOR CHILDREN

Purpose: To develop an intensive and detailed process of consulting and planning with individuals and existing centers who are known to have experience in the field of day treatment for emotionally disturbed children of preschool and latency age. The addition of a day treatment center to the existing outpatient facility at Reiss-Davis Clinic for Child Guidance is expected to improve the Clinic's present ability to provide a comprehensive program of care for severely ill children.
Methods: A pool of professionals with experience has been developed from which consultants will be drawn for visits to clinic as available. The plan also includes on-site visits to several of the existing day treatment facilities. A Senior Research Psychologist is being added to the staff, charged with specific planning for method of evaluation of the Day Treatment Program and designs and methodology for other research activities within the program.
Investigator(s): Rocco L. Motto, M.D., Director; Bernice T. Eiduson, Ph.D., Director of Research; and Christoph M. Heinicke, Ph.D., Senior Research Psychologist, Reiss-Davis Clinic for Child Guidance, 9760 West Pico Blvd., Los Angeles, Calif. 90035.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-IV-6 FOLLOW-UP STUDY OF CHILDREN WHO ATTENDED A CLINICALLY ORIENTED DAY SCHOOL FOR CHILDREN WITH SPECIAL NEEDS

Purpose: To determine subsequent social and academic adjustment in children entering or returning to public school, as a function of habilitative or rehabilitative experiences in a private day school for children with special needs.
Subjects: 75 children who attended Laurence School for more than two years and then entered a public school facility.
Methods: Questionnaire sent: (1) to parents, evaluating child's current academic adjustment, social participation, emotional maturity, and family group adjustment; (2) to child, evaluating his self-concept, relationship with peers, and relationship with family; and (3) to school, evaluating relationship with peers, academic achievement, and emotional maturity. Comparisons to be made between parent and child judgment, parent and school, and child and school. Comparison between attitudes and behavior while at Laurence and currently, by the various observers.
Duration: Spring 1965-spring 1966.
Investigator(s): Lillian B. Vogel, Ph.D., Director of Psychological Services; Marvin Jacobson, A.B., Director; and Sonia Braverman, A.B., Assistant Director, Laurence School, 6428 Woodman Ave., Van Nuys, Calif.

19-IV-7 A STUDY OF THE PROGRESS OF THERAPY WITH CHILDREN WHO ARE BEHAVIOR PROBLEMS

Subjects: Ten boys, aged 8 to 11 years, who manifested behavior problems

and were given group psychotherapy with their mothers.
Methods: Subjects were given group psychotherapy with their mothers.
Findings: It was found that a change in the mother's perception of her boy was accompanied by a decrease in boy's aggressive behavior. In addition, there was some correlation between the boy's behavior in therapy and at home.
Duration: 1959-continuing.
Investigator(s): Keiichi Mizushima, et al., 1300 Mure, Mitaka-shi, Tokyo, Japan. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Summer 1964.)
Cooperating group(s): Tokyo-to Central Child Guidance Center; Criminology Research Association.

19-IY-1 RESIDENTIAL PSYCHIATRIC TREATMENT OF CHILDREN

Purpose: To clarify the central purposes and issues in the intensive inpatient treatment of children.
Subjects: Patients of the Children's Hospital, Menninger Clinic (N = 55 to 60), especially the adolescent girls patient group (N = 8).
Methods: Statistical data derived from various sources; patient observation; careful case study; prediction of the effect of planned intervention; etc.
Duration: January 1963-January 1968.
Investigator(s): Edwin Z. Levy, M.D., Staff Psychiatrist, Children's Hospital, Menninger Foundation, Topeka, Kans. (Reported by Robert E. Switzer, M.D., Children's Division, The Menninger Clinic.)
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-IY-2 THERAPEUTIC ASPECTS OF CONTROL AND DISCIPLINE ON A WARD FOR EMOTIONALLY DISTURBED CHILDREN

Purpose: To describe and analyze disciplinary or controlling practices on a ward for emotionally disturbed children in order to identify their effects on the development of the inner controls necessary for healthy social adaptation.
Subjects: Patients in Children's Ward of the Massachusetts Mental Health Center--12 to 14 boys and girls, aged 4 to 13, with severe neurotic, behavioral, or psychotic problems.
Methods: Clinical observation by ward personnel and child psychiatrists; regular discussion of daily ward practices; consistent recording of various clear-cut disciplinary or controlling practices (such as seclusion); particular focus on several patients, beginning with their admission, for whom usual ward practices are modified for periods of time; and integration of several different vantage points of observation (ward reports, play sessions, school reports, home reports).
Findings: A study of one year's duration has been completed in which seclusion was the only disciplinary practice studied. Findings suggest that seclusion can be effective in fostering the development of inner emotional controls in children if used as part of a significant relationship between nurse (or attendant) and child.
Duration: September 1963-July 1967.
Investigator(s): Donald S. Gair, M.D., Instructor in Psychiatry; Dexter M. Bullard, Jr., M.D., and Jeannette H. Corwin, M.D., Assistants in Psychiatry, Medical School, Harvard University, Cambridge, Mass.
Publication: Article on initial study being prepared, not submitted anywhere as yet. Abstract of paper presented at American Orthopsychiatric Association

meeting has appeared in the March issue of the American Journal of Orthopsychiatry (1965).

19-IY-3 THE PATIENT CAREER

Purpose: It is possible to conceptualize the experiences of persons defined and treated as mentally ill as a temporal sequence of events or "career." The career of the mental patient may be thought of as having three distinct phases: a prepatient phase which describes the person in the community prior to hospitalization; an inpatient phase which describes the patient in the psychiatric treatment center; and a postpatient phase which describes the person as he is back in the community after the experience of hospitalization. The purpose of the study is to explore changes in self-attitudes that accompany this process.
Subjects: First admission patients between the ages of 15 and 20, confined to several Iowa psychiatric hospitals.
Methods: Questionnaire and focused interview. Data to be collected from patients, psychiatrists, and nursing personnel. Case outcome after hospitalization to be measured by length of community tenure and with further patient interviews regarding post-hospital adjustment. Family members will also be interviewed during this phase.
Duration: June 1965-June 1967.
Investigator(s): Stephan P. Spitzer, Ph.D., Assistant Professor, and Norman K. Denzin, B.A., N.I.M.H. Fellow, Department of Sociology and Anthropology, University of Iowa, Iowa City, Iowa.
Cooperating group(s): Iowa Urban Community Research Center; Iowa State Mental Health Authority.
Publication: Series of monographs.

19-IY-4 FOLLOW-UP OF JUVENILE PSYCHIATRIC INPATIENTS RELEASED TO FAMILY

Purpose: To determine extent to which juvenile psychiatric inpatients released to their own or substitute families from the Fulton State Hospital Youth Center have made a successful adjustment in terms of objective criteria (re-institutionalization, delinquency, school attendance, and promotion); and to evaluate prognostic background factors which may predict success-failure in post-hospital outcome.
Subjects: About 100 psychiatric inpatients of normal intelligence (I.Q. above 70), of mixed diagnoses, released (on trial visit or direct discharge) to own or substitute (adoptive, foster, relative) families during the years 1957-1962 before reaching the age of 16, of either sex.
Methods: Obtain from public agencies information on each former patient's re-hospitalization in any psychiatric inpatient facility, incarceration in any correctional facility, delinquency record, school record with respect to truancy, grade-promotion, and continuing in school vs. dropping out; follow-up data coded in gross categories, probably: re-institutionalization, serious delinquency short of re-institutionalization, minor delinquency or school failure or dropout, no delinquency, etc.; analyze statistical relationships between various status and background variables and outcome index.
Duration: September 1964-September 1965.
Investigator(s): William R. Morrow, Ph.D., Research Coordinator, Fulton State Hospital, Fulton, Mo. 65251.

19-IY-5 RESIDENTIAL SCHOOLS FOR DISTURBED CHILDREN

Purpose: To develop and test feasibility of treatment of emotionally disturbed children in residential schools manned by carefully selected young teachers and backed by psychiatrists, psychologists, social workers, and other mental health workers serving as consultants.
Methods: Two schools with associated camps are involved: Cumberland House in Tennessee, and Wright School in North Carolina. Design for testing efficacy of program involves pre- and post-experience evaluations and follow-up at periodic intervals. There are several comparison groups for which comparable data are being obtained.
Findings: In spite of the relatively short period of stay at the schools (four to eight months), current data indicate that schools are having a positive influence on the adjustment of the children, enabling them to return to home and school and to cope adequately.
Duration: Not reported-1968.
Investigator(s): Nicholas Hobbs, Ph.D.; Wilbert Lewis; and Laura Weinstein, Department of Psychology, George Peabody College for Teachers, Nashville, Tenn.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Social deviancy

Note: Some studies appearing in this section were selected from Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency published by the National Council on Crime and Delinquency in New York. Studies thus obtained are noted: (Reported by NCCD.)

19-JG-1 STUDY OF DELINQUENCY AMONG JEWISH YOUTH IN LOS ANGELES COUNTY

Purpose: To reveal extent of delinquency among Jewish youth in Los Angeles County in comparison to that of the general population; and to add to existing body of information regarding nature of delinquent youth and afford descriptive material of the groups under study as well as of the contrasts between them. Study may yield implications for family life education, including the essentials of family strength and the emotional and educational nurture of children.
Subjects: Two groups of slightly more than 100 white delinquent boys residing in Los Angeles County, matched by socio-economic status and age. One group is made up of Jewish and the other group of protestant boys.
Methods: Using the Los Angeles County Probation Department records, the percentage of Jewish boys on whom delinquency petitions were filed over a one-year period is being compared with the percentage of Jewish boys in the total population and with a control group of white protestant delinquent boys. The case histories of the boys have been studied.
Duration: April 1964-June 1966.
Investigator(s): Joy Torstrup McAllister, Ed.D. Candidate, University of California, Los Angeles 24, Calif. (Reported by May V. Seagoe, Professor and Associate Dean, School of Education, University of California.)
Cooperating group(s): Los Angeles County Probation Department.
Publication: Data and results will be available upon completion of the dissertation.

BEST COPY AVAILABLE

19-JG-2 EXTENT AND CHARACTER OF DELINQUENCY IN AN AGE COHORT

Purpose: To show extent, nature, and progression of recorded delinquency in an age-cohort, relationship of age to delinquent conduct, age at onset of different forms of delinquency, changes in delinquency as the cohort grows older, variations in elapsed time between delinquencies, etc.

Subjects: Males born in Philadelphia in 1945, or known to be living in Philadelphia before the age of 10, and remaining in that city until their eighteenth birthday.

Methods: Race, intelligence, type of neighborhood, etc. will be studied as they relate to delinquency and nondelinquency. Analysis of delinquent acts will take account of their qualitative nature, and for that purpose a scale permitting the application of weights of seriousness to different delinquent acts will be used. A profile of the delinquency of the cohort will be available for each of its delinquent members and this may provide indications of the point when social action programs should intervene to prevent further or more serious delinquency on the part of this or that class of delinquents.

Duration: Not reported-1966.

Investigator(s): Thorsten Sellin, Ph.D., and Marvin E. Wolfgang, Ph.D., Professors of Sociology, University of Pennsylvania, Philadelphia, Pa. 19104.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-JG-3 STUDIES OF JUVENILE DELINQUENCY IN SAN FRANCISCO

Purpose: To secure data on every juvenile delinquent who came to the attention of the juvenile court and/or the police department of San Francisco during the calendar year 1960.

Subjects: (1) Official juvenile court cases--those cases in which a legal petition was filed; (2) unofficial juvenile court cases--those cases brought to the attention of the court, but for which no legal petition was filed; and (3) police department "warned, but not cited" cases.

Methods: Data were coded, transmitted to punch cards, and machine processed. Analysis was made of a number of variables, including family income, relative deprivation, geographic distribution, educational attainment, employment, racial factors, and age and sex of delinquents.

Duration: April 1961-March 1964.

Investigator(s): Frank M. Moncrief, Research Director, and Jane H. Fator, Social Planning Department, United Community Fund of San Francisco, 2015 Steiner St., San Francisco 15, Calif. (Reported by NCCD.)

Publication: Juvenile Delinquents in San Francisco, 1960: a report to the Committee on Youth, United Community Fund of San Francisco, March 1964.

19-JG-4 JUVENILE DELINQUENCY IN THE PROVINCES OF GRANADA, MALAGA, ALMERIA, JAEN, CENTA, AND MELILLA

Purpose: To ascertain data on characteristics, forms, and etiology of antisocial acts committed by minors in these several Spanish provinces since 1950. These provinces are of particular interest since none has as yet reached the stage of real economic development.

Methods: Data was gathered on each juvenile by means of a questionnaire detailing information on personal characteristics, family, housing, education, time spent in school, type of reading, movies or television enjoyed, residence in an urban or rural environment, etc. Questionnaire was supplemented with data from juvenile courts, reformatories, and other residential children's institutions. For those children whose records could

not be completed in this way, assistants and social workers interviewed the family or the minor himself.
Duration: October 1963-December 1966.
Investigator(s): Jose M. Stampa Braun, and Dr. Jose A. Sainz Cantero, Arabial, 95 (7º A), Granada, Spain. (Reported by NCCD.)
Cooperating group(s): University of Granada; Spanish Ministry of National Education.
Publication: Monographs will be produced on various aspects of the investigation and monographs will be collected and published as a complete study.

19-JG-5 A SURVEY OF JUVENILE TRAINING SCHOOLS IN GEORGIA

Purpose: A survey of training school needs as an aid in planning the programs of these institutions and also to help in interpreting the need for expenditures for personnel and services as well as facilities and equipment.
Methods: Analysis of current statistical information as well as visits to each institution for the purpose of reviewing the current programs in these institutions; evaluation of educational, vocational, treatment, and child care methods and services and physical plants.
Duration: December 1963-June 1964.
Investigator(s): Frederick Ward, Jr., National Council on Crime and Delinquency, Littlefield Bldg., Room 530, Austin, Tex.; and Abraham G. Novick, M.S., Executive Director, Berkshire Farm for Boys, Canaan, N. Y. (Reported by NCCD.)
Cooperating group(s): Georgia State Department of Child and Family Services.

19-JG-6 A SURVEY OF JUVENILE DELINQUENCY IN NORTHERN RHODESIA (ZAMBIA)

Purpose: To explore the problem of juvenile delinquency in Northern Rhodesia, and to identify specific areas for future research.
Methods: Structured interviews with elders in the tribal areas and with urban dwellers are carried out to identify the norms of delinquent and nondelinquent behavior in rural and urban parts of the country. Statistics and other information on juvenile delinquency in Northern Rhodesia since 1939 are considered to show its extent and development. Statistical and case study methods are used to identify causative factors. A survey and assessment is made of social, health, and guidance services as prevention measures.
Duration: November 1963-December 1964.
Investigator(s): W. Clifford, Principal, Oppenheimer College of Social Service, P.O. Box RW. 132, Lusaka, Zambia. (Reported by NCCD.)
Cooperating group(s): Ministry of Local Government and Social Welfare, Northern Rhodesia Government; Mining Groups in Northern Rhodesia; United Nations Section of Social Defense.

19-JG-7 SHORT-TERM TREATMENT OF YOUNG OFFENDERS INVOLVING DEPRIVATION OF LIBERTY

Purpose: To discover the full range of treatments available for young offenders, which of these involve deprivation of liberty, and whether special forms of short-term institutional treatment exist or are proposed.
Duration: 1962-continuing.
Investigator(s): Council of Europe, Division of Crime Problems, Europe

House, Strasbourg, France. (Reported by NCCD.)
Publication: Council of Europe, European Cooperation in 1962, Strasbourg, 1963. (p.227); Council of Europe, XIVth Report of the Committee of Ministers to the Consultative Assembly (Document 1564), Strasbourg, 1963. (pp. 71-72, para. 312).

19-JJ-1 PREDICTORS OF DELINQUENT CONDUCT

Purpose: To study delinquents and their delinquent behavior in order to determine relationships of their social characteristics to type and seriousness of their offenses and to delinquency rates in general; to test and, hopefully, to demonstrate the usefulness of multivariate analysis in criminological research.
Subjects: 263 white, male juvenile delinquents who appeared in a juvenile court in Trenton, New Jersey, between the years of 1937 and 1959.
Duration: January-December 1965.
Investigator(s): Richard S. Sterne, Ph.D., Assistant Professor of Sociology, University of Miami, Coral Gables, Fla.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-JJ-2 THE BUILDING OF AN INSTRUMENT FOR THE ASSESSMENT OF THERAPY EFFECT

Purpose: To develop an instrument for the assessment of the effect of treatment on a group of emotionally disturbed delinquent adolescent males.
Subjects: 40 institutionalized delinquent males and 40 normal controls.
Methods: Instrument consists of a series of tests, each built to measure one or more personality characteristics of the young delinquents. Among the characteristics included are: impulsivity, lack of persistency, suggestibility, lack of parental identification, low self-esteem, and some defense mechanisms. Among the tests used are: Porteus maze test, Feather's persistence test, Autokinetic Effect, Osgood's Semantic Differential, and Level of Aspiration tests.
Findings: The data, as analyzed at present time, indicate that more than half of the 90 variables (all objective scores) discriminate on a significant level between experimental and control group.
Duration: January 1962-1965.
Investigator(s): L. N. J. Kamp; J. T. Barendregt; and J. A. M. Schouten, Scientific Committee, Children's Department, Netherlands Ministry of Justice, Spinoza Str. 7, Amsterdam, The Netherlands. (Reported by NCCD.)

19-JJ-3 THE PREDICTION OF VIOLENCE IN THE COMMUNITY

Purpose: To develop new predictive tools for the diagnosis and evaluation of assaultive and homicidal conduct in juvenile delinquents; and to establish the validity and reliability of violence forecasts.
Subjects: A population of violence-prone juveniles, divided into six basic categories.
Methods: 50 empirically established prediction factors will be validated.
Duration: May 1964-May 1974.
Investigator(s): Dr. Renatus Hartogs, 7 East 86th St., New York 28, N. Y. (Reported by NCCD.)
Cooperating group(s): New York City Youth House; Community Guidance Service

of New York City; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-JJ-4 PREDICTING THE DELINQUENCY OF MIDDLE SCHOOL STUDENTS FROM A RORSCHACH TEST APPLIED BEFORE ENTERING THE SCHOOL

Subjects: 300 students.
Methods: Rorschach given to subjects before they enter school. After an interval of nine years, student's behavior in the middle school was investigated. Their teachers rated them as to kind of behavior.
Findings: Overall rating of Rorschach protocols at the preschool age corresponded with later behavioral characteristics; this was especially true of isolation, wandering, and aggressive traits.
Duration: December 1963-not reported.
Investigator(s): Jun Ichimura, Department of Psychology, Kanazawa University, Ishikawa, Japan. (Reported by NCCD.)
Cooperating group(s): Kanazawa Family Court.

19-JM-1 CLASSIFICATION OF MATERIALS OF "FALCON" FIELD DIARY

Purpose: To identify excerpts in the field diary illustrative of structural and developmental characteristics of a delinquent street gang, and of major problems of practice in attempts to reduce frequency and seriousness of delinquent acts.
Subjects: A single 16-member street gang in an ethnic low-income community of a metropolitan city.
Methods: Classification of field diary materials.
Duration: April 1963-July 1966.
Investigator(s): Solomon Kobrin, M.A., Chief, Division of Social Systems Analysis, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)
Publication: Monograph.

19-JM-2 THE CRITERIA OF STATUS AMONG ADOLESCENT STREET GANGS

Purpose: To ascertain relationships between certain criteria of group status and the prestige of street gangs in a single neighborhood.
Subjects: Subjects consisted of eight street gangs constituting a network of mutually known and interacting groups in a single low-income neighborhood of a midwestern metropolitan city.
Methods: Identified leaders of each group were interviewed to obtain mutual ratings on a scale of prestige, and justifications of the ratings made. Patterns of justification of specific pretige ratings were subsequently redefined as criteria of status.
Findings: Analysis of ratings and their justifications defined three types of delinquent "style", and raised question concerning adequacy of current "opportunity" theory in accounting for empirically established delinquency patterns in the community investigated.
Duration: November 1961-not reported.
Investigator(s): Solomon Kobrin, M.A., Chief, Division of Social Systems Analysis, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)

19-JM-3 PERSONALITY IN DELINQUENCY: RESPONSE TO TREATMENT

Purpose: To assess predictive validity of measures of four personality dimensions to predict facets of institutional adjustment and post-institutional behavior.
Subjects: 300 consecutive admissions to a boys training school who are capable of reading at the fifth grade level.
Methods: Personality dimensions will be assessed by factor analytically derived personality questionnaires, behavior ratings, and case history analyses. These dimensions will be related to indices of adjustment and behavior while incarcerated and while on post-institution parole.
Duration: September 1964-August 1968.
Investigator(s): Herbert C. Quay, Ph.D., Research Director, Children's Research Center, University of Illinois, Urbana, Ill.; and Robert B. Levinson, Ph.D., Project Director, National Training School for Boys, Washington 13, D. C.
Cooperating group(s): U. S. Department of Justice; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication in appropriate professional journals.

19-JM-4 PERCEPTUAL AND PROBLEM-SOLVING RIGIDITY AS A FACTOR IN RECIDIVISM AMONG JUVENILE DELINQUENTS

Purpose: To determine if there is a relationship between recidivism and inability to adopt flexible modes of behavior in coping with problem situations.
Subjects: Juvenile delinquent males under 18, first offenders and recidivists (those convicted of the same type of offense three or more times). Narcotics offenders are excluded.
Methods: Paper and pencil tests for peceptual flexibility; performance test for perseveration in problem solving; and personality inventory for measure of ego-strength.
Findings: The delinquent group showed significantly less ego-strength than did the comparison group.
Duration: 1962-June 1965.
Investigator(s): Jamie Stewart-Bentley (Ed.D. Candidate, University of California, Los Angeles), Consultant in Research and Guidance, Los Angeles County Superintendent of Schools, Los Angeles, Calif. (Reported by May V. Seagoe, Professor and Associate Dean, University of California, Los Angeles 24, Calif.)
Cooperating group(s): Los Angeles County Probation Department.
Publication: Study will be available as a doctoral dissertation from the University of California, Los Angeles.

19-JM-5 MEDICO-LEGAL PROBLEMS OF JUVENILE DELINQUENCY

Purpose: To discover any distinguishing characteristics in a selected group of juvenile delinquents (murderers in particular).
Methods: Battery of four mental tests (Wechsler-Bellevue, Rorschach, TAT, GGWS); clinical examination; X-rays; and electroencephalographs.
Duration: January-December 1964.
Investigator(s): C. Romano; A. Paolella; B. Pannain; and V. M. Palmieri, Direttore, Instituto di Medicina Legale, Universita di Napoli, Via Luciano Armanni 5, Naples, Italy. (Reported by NCCD.)

19-JM-6 A STUDY OF THE INCIDENCE OF THE DRINKING OF ALCOHOLIC BEVERAGES BY DELINQUENT BOYS COMMITTED TO THE MASSACHUSETTS YOUTH SERVICE BOARD

Subjects: 500 delinquent boys, ages 7 to 17, in the custody of the Massachusetts Division of Youth Service.
Methods: Survey.
Findings: 72 percent of group had had at least one drinking experience; 64 percent had experienced more than one; 10 percent were classified as problem drinkers. Other findings reported in mimeograph by Massachusetts Division of Youth Service bearing title of this study.
Investigator(s): Francis J. Kelly, and John D. Coughlan, Director, Massachusetts Division of Youth Service, 14 Somerset St., Boston, Mass. (Reported by NCCD.)
Cooperating group(s): Alcoholism Clinic, Peter Bent Brigham Hospital; Massachusetts Division of Alcoholism.

19-JM-7 DETERRENTS AND INCENTIVES TO CRIME AMONGST YOUNG PEOPLE

Purpose: To relate extent and nature of teenager's self-confessed delinquent acts, and those of his peers known to him, to the external and internalized incentives and deterrents to commit such acts.
Subjects: Nationally representative sample of males aged 15 to 21.
Methods: Incentives and deterrents to commit crimes will be inferred from variables such as attitudes of persons in the environment; teenager's own attitudes toward "authority", his knowledge of legal penalties, his beliefs about the penalties which would be appropriate for various crimes and delinquencies, and his ratings of such acts on a social-distance scale. Also measured will be the incentives and deterrents which he himself can verbalize.
Duration: 1964-1965.
Investigator(s): H. D. Willcock, Social Survey, Central Office of Information, Westminster Bridge Rd., London, SE 1, England. (Reported by NCCD.)
Cooperating group(s): Home Office.

19-JM-8 CHARACTERISTICS OF JUVENILE DELINQUENTS IN THE REFORMATORY OF ANKARA, TURKEY (COCUK ISLAHEVI)

Purpose: To gather data on characteristics of juveniles imprisoned in Ankara Reformatory. This data will be used in drafting of legislation on juvenile delinquency, on treatment of juvenile delinquents, and on organization and jurisdiction of juvenile courts in Turkey.
Subjects: 130 juvenile delinquents in the Ankara Reformatory.
Duration: March-August 1964.
Investigator(s): M. Lopez-Rey, and N. Franko, UNTAB P. K. 407, Ankara, Turkey. (Reported by NCCD.)
Cooperating group(s): Department of Prison Administration, Turkish Ministry of Justice.

19-JM-9 ATTITUDES OF DELINQUENTS TOWARD AGENCIES OF DELINQUENCY CONTROL

Purpose: To produce and prepare material regarding attitudes of delinquents toward agencies of delinquency control.

Methods: A group of young offenders will be interviewed, and their attitudes assessed immediately on reception at the institution, during their stay there, just before release, and after two months in community. Changes in their attitudes and perceptions will be studied in relation to pre-existing attitudes, specific institution experiences, and their reception on return to the community.
Duration: September 1962-August 1964.
Investigator(s): Brendan A. Maher, Ph.D., and Stanton Wheeler, Ph.D., Center for Research in Personality, Department of Social Relations, Harvard University, Cambridge 38, Mass. (Reported by NCCD.)
Cooperating group(s): Brandeis University; Harvard School of Public Health; Boston University; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-JM-10 WECHSLER INTELLIGENCE SCALE FOR CHILDREN PATTERNING AND DIFFERENTIAL DIAGNOSIS OF READING PROBLEMS OF AGGRESSIVE, DELINQUENT BOYS

Purpose: To ascertain the WISC patterning of a group of delinquent boys with reading problems.
Subjects: 25 boys receiving residential psychiatric care at Floyd Patterson House-Wiltwyck School for Boys, of normal intelligence and two years below expectancy in reading. All were adjudicated delinquent and neglect cases from a low socio-economic group.
Methods: Statistical analysis; F Test; and analysis of variance.
Findings: Error variance was so great that a diagnosis of primary reading disability is unwarranted by WISC patterning.
Duration: September 1963-February 1964.
Investigator(s): Paul S. Graubard, Wiltwyck School for Boys, Inc., 260 Park Ave. South, New York, N. Y. 10010. (Reported by NCCD.)

19-JM-11 JUVENILE DELINQUENTS AND THEIR ABNORMAL EEG PATTERNS

Purpose: To discover why delinquents with abnormal EEG patterns were 85 percent habitual criminals when only 39 percent of normal delinquents were habitual criminals.
Subjects: 25 delinquents who showed the 14 and 6 c-s positive spikes pattern. 21 of them were habitual criminals.
Methods: Investigation of offense history; psychological tests; and medical history of subjects.
Findings: It seemed that there was little relationship between intelligence and the EEG pattern. Delinquents showing this EEG pattern were characteristically "E" type on the Kraepelin Performance Test. The medical history of the 25 delinquents examined did not show the pattern supposed to be related to this EEG pattern. Clinical complaints were mainly slight disorders of autonomic nervous system and hormone system.
Duration: April 1960-March 1964.
Investigator(s): Tsutomu Ishihara, 698 Tadeicho, Sakai-shi, Osaka-fu, Japan. (Reported by NCCD.)
Cooperating group(s): Osaka Juvenile Detention and Classification Home; Second Physiology Section, Department of Medicine, Osaka University; Laboratory of Department of Medicine, Tottori University.

19-JM-12 STUDY OF THE HEREDITARY MOTOR CONSTITUTION OF JUVENILE DELINQUENTS IN RELATION TO CRIME COMMITTED

Purpose: To study fundamental types of motor activity among juvenile delinquents; and to check whether a particular type of individual motor constitution influences the choice of means and tools used in committing a crime.

Duration: March 1963-continuing.

Investigator(s): Professor Paolo Manunza, Director, Institute of Legal Medicine, University of Bologna, Via Irnerio 49, Bologna, Italy. (Reported by NCCD.)

Cooperating group(s): Center for the Reeducation of Juvenile Delinquents of Bologna.

19-JM-13 RESEARCH ON EXPRESSIVITY IN LANDSCAPE DRAWING FROM IMAGINATION AND ON COLOR PREFERENCE AMONG JUVENILE DELINQUENTS

Purpose: To show that, in landscape drawing from imagination, there exists, independent of subjects' drawing skill, a fundamental difference between those making simple landscapes containing simple, essential lines, and no people, and those making detailed and crowded landscapes, which burst with details, indicate multiple perspectives, and have representations of people and animals in them; and to clarify and point out other differences and preferences with introverts tending to use cold colors and extroverts, warm ones.

Subjects: Juvenile delinquents maladapted to the environment in which they have been raised, who show character disorders.

Duration: March 1963-continuing.

Investigator(s): Professor Paolo Manunza, Director, Institute of Legal Medicine, University of Bologna, Via Irnerio 49, Bologna, Italy. (Reported by NCCD.)

Cooperating group(s): Center for the Reeducation of Juvenile Delinquents of Bologna.

19-JM-14 THE JUVENILE DELINQUENT'S SELF-CONCEPT AND HIS CONCEPT OF SOCIETY

Purpose: The young delinquent has a concept of the social universe, and of himself as a member of society, in which he is a socially incompetent being who feels ostracized by a reproachful and suspicious society. He is so firmly anchored in this concept that it appears to him to be his inescapable destiny. He chooses the delinquent identity as the only possible outlet. Starting from these hypotheses, the objective is to construct diagnostic and other instruments in order to find out how this feeling of incompetence and this negative identification develops in each individual delinquent. It is also hoped that useful instruments for the diagnosis and prognosis of young delinquents and predelinquents with a view to reeducation can be constructed.

Subjects: A group of 80 delinquents, 15 to 20 years of age, and a control group of 50 nondelinquents.

Methods: Qualitative as well as quantitative elaboration of the material obtained is foreseen.

Duration: 1963-1965.

Investigator(s): Francois Belpaire, and Rene Dellaert, 39 Ouest Blvd., Gouin, Montreal, Que. (Reported by NCCD.)

Cooperating group(s): Center of Research in Human Relations, Montreal; Boscoville; Aquinas Fund.

Publication: Canadian Journal of Corrections 6:1:58-64, January 1964.

19-JM-15 INQUIRY ON THE RELATION BETWEEN FAMILY STRUCTURE, SOCIO-ECONOMIC CONDITIONS, LEVEL OF EDUCATION, AND THE CRIMINAL BEHAVIOR OF MINORS

Subjects: 1,000 minors distinguished by the irregularity of their conduct and for whom a criminal career can be predicted.
Methods: Collection of medical, psychiatric, psychological, social, and economic data on the family structure of subjects.
Duration: 1963-continuing.
Investigator(s): Dr. Francesco Introna, Instituto di Medicina Legale e delle Assicurazioni, Via Falloppio 16, University of Padua, Padua, Italy. (Reported by NCCD.)
Cooperating group(s): Instituto di Medicina Legale, University of Padua; National Council for the Moral Protection of Young Boys.

19-JM-16 ENVIRONMENTAL OBSERVATION OF CHILDREN COMMITTED TO A CHILD EDUCATION AND TRAINING HOME

Subjects: All delinquent children committed to the Shutoku Child Education and Training Home from March 1954 to August 1959.
Methods: Basic data and statistics were collected on subjects and on delinquency in Osaka City in general.
Duration: March 1954-March 1964.
Investigator(s): Hidenobu Watahabe, Osaka-Furtisu Shutoku-Gakuin, 813 Takaida, Kashiwabara-shi, Osaka-fu, Japan. (Reported by NCCD.)
Cooperating group(s): Shutoku Child Education and Training Home, Osaka Prefecture; Kinki District Child Education and Training Council.
Publication: "Kyogo", No. 105, 1960 (published by Zenkoku Kyogo Kyogikai).

19-JM-17 ESSAY ON GANGS: AN ESSAY ON THE SOCIOLOGICAL AND PSYCHO-SOCIOLOGICAL SIGNIFICANCE OF ADOLESCENT GROUPS

Purpose: Study of adolescent gangs (including, eventually, school gangs and young adults) considered in the vast framework of the problems of adolescents in a society from a sociological and psycho-sociological perspective.
Methods: Contact with different specialists of adolescent groups; utilization of the monograph "Camille Jullian" on contact between a group of adolescents and a street gang; utilization of statistical studies by CFD-ES at Vaucresson; and systematic analysis of different projects and studies in France on the problem.
Duration: 1963-1964.
Investigator(s): Ph. Robert, 19 Rue de Segur, Bordeaux, Gironde, France. (Reported by NCCD.)
Cooperating group(s): Department of Sociology, School of the Humanistic Sciences, University of Bordeaux; Groupe d'Ethnologie Sociale; Groupe de Sciences Sociales de la Jeunesse.
Publication: Robert, Ph., Revue Internationale de Criminologie et de Police Technique (Geneva).

19-JM-18 STANDARDIZATION OF A GROUP BENDER-GESTALT METHOD OF ADMINISTRATION IN A POPULATION OF "COURT-LABELLED" DELINQUENT BOYS

Purpose: To standardize a group Bender-Gestalt technique of administration

in such a manner that group-administered figure reproductions will not differ significantly in size from reproductions resulting from individually-given cards; and to test the hypothesis that there is an optimum ratio of approximately 1:6 between size of individual Bender-Gestalt patterns and group figures which, when used, will result in no significant size difference between individual and group-administered reproductions.
Subjects: Court-labelled delinquent boys.
Methods: Group cards of different ratios to Standard Bender-Gestalt stimuli were presented to subjects and effect of these to standard Bender-Gestalt patterns were compared with differences, as far as size is concerned, which exist between group and individually-administered Bender-Gestalt figure reproductions.
Duration: March-June 1964.
Investigator(s): Richard G. Doiron, and Russell H. Levy, Ph.D., Director of Clinical Services, Reception and Diagnostic Center, Illinois Youth Commission, Box 1502, Joliet, Ill. (Reported by NCCD.)
Cooperating group(s): Department of Psychology, Loyola University Graduate School.

19-JM-19 CROSS-SECTIONAL PSYCHOMETRIC EVALUATION OF "COURT-LABELLED" DELINQUENT BOYS

Purpose: To effect a comprehensive professional evaluation between total assets and needs of a particular youth and the most adequate programs operative within the Youth Commission.
Subjects: 904 Negro and white delinquent boys, inmates of the Reception and Diagnostic Center of Illinois Youth Commission.
Methods: Collection of data by use of a group psychometric testing program and from individual administration of the WISC and/or WAIS tests. From 2,641 sets of data, mean I.Q. values and standard deviations have been set forth chronologically for each of six psychometric tests. Progressive methods and practices of correctional containment, embodying the de-emphasis of severe external control security measures, provided an acceptable environment in which to pursue the study.
Duration: January 1963-December 1964.
Investigator(s): Russell H. Levy, Ph.D., Director of Clinical Services; Walter J. Grenier; Raymond M. Daly; and Richard G. Doiron, Reception and Diagnostic Center, Illinois Youth Commission, Box 1502, Joliet, Ill. (Reported by NCCD.)

19-JM-20 DEFINITION OF FREE CHOICE BY "COURT-LABELLED" JUVENILE DELINQUENTS AND ITS RELATION TO THE COMMITTING OFFENSE

Purpose: To discover a definition of free choice by court-labelled delinquent boys and relate that definition to the most recent illegal activity of the boy.
Subjects: 26 delinquent boys between the ages of 13 and 17, selected randomly from staff lists at the Reception and Diagnostic Center of the Illinois Youth Commission.
Methods: Theoretical and practical aspects of free choice were discussed and results categorized in terms of content, level of abstractness, and level of personal need expressed.
Findings: Results indicated that every subject felt that free choice was open to him, but as the discussion noted free choice exists in degrees, and is influenced by many variables. Probably not every subject exercised his full responsibility regarding free choice.
Duration: November 1963-February 1964.

Investigator(s): Dale LeNoue and Russell H. Levy, Ph.D., Director of Clinical Services, Reception and Diagnostic Center, Illinois Youth Commission, Box 1502, Joliet, Ill. (Reported by NCCD.)
Cooperating group(s): Department of Psychology, Loyola University Graduate School.

19-JM-21 AN ATTEMPT TO RELATE CERTAIN HOUSE-TREE-PERSON (HTP) AND BENDER VISUAL MOTOR GESTALT (BVMG) TEST FINDINGS TO COMMITMENT OFFENSES OF "COURT-LABELLED" JUVENILE DELINQUENT BOYS

Purpose: To test hypothesis that some significant correlation exists between certain HTP and BVMG test results produced by juvenile delinquents and the relative magnitude of the commitment offense.
Subjects: 16-year old "court-labelled" juvenile delinquent wards of the Illinois Youth Commission.
Methods: Each group of subjects administered HTP was studied for presence of pathway to House, absence of door to House, and whether a male was drawn as first human figure. Each group administered BVMG was studied for specific instances of pattern collision. Various criminal offenses will be compared to test data.
Duration: January 1963-continuing.
Investigator(s): Russell H. Levy, Ph.D., Director of Clinical Services, Reception and Diagnostic Center, Illinois Youth Commission, Box 1502, Joliet, Ill. (Reported by NCCD.)

19-JV-1 SELF-HELP PROJECT FOR YOUTHFUL DRUG USERS

Purpose: An experimental self-help project for youthful drug users who want to cure their addiction. Ultimate goal is to determine feasibility of establishing a halfway house-type community center for the prevention, treatment, and rehabilitation of youthful narcotic addicts.
Methods: Voluntary recruits from halfway houses, medical facilities, state correctional institutions, and county jails will congregate at the Add-Center to discuss their common problems. A research staff consisting of criminologists, graduate students, and former narcotic addicts will observe and counsel these young addicts and members of their families; and various community supportive services--legal, medical, psychiatric, educational, employment and welfare--will be available to members.
Duration: July 1965-June 1966.
Investigator(s): Herbert Blumer, School of Criminology, University of California, Berkeley, Calif. 94720.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-JV-2 AN EXPLORATORY STUDY OF NARCOTIC CONTROL PROGRAM FOR YOUTH AUTHORITY PAROLEES

Purpose: To study development and operation of the Youth Authority's Narcotic Control Project in Los Angeles, with special emphasis on techniques of intensive parole supervision, systematic nalline testing, and regular group counseling, and present statistical material on significant aspects of parole progress.
Subjects: Male Youth Authority wards who have histories of narcotic addiction and are released on parole have been assigned to special narcotic

643

caseloads. A total of 135 such wards are involved in study.
Methods: Information available to project parole agents will be used to study etiology and epidemiology of narcotics addiction.
Duration: 1962-continuing.
Investigator(s): George F. Davis; William E. Cook, Ph.D.; and Keith S. Griffiths, Ph.D., California Department of the Youth Authority, 401 State Office Building No. 1, Sacramento 14, Calif. (Reported by NCCD.)

19-JV-3 OBSERVATION OF CHARACTER STRUCTURE OF JUVENILE SEX OFFENDERS

Subjects: 25 juvenile sex offenders at Morioka Juvenile Prison.
Methods: Rorschach tests.
Findings: 16 of the 25 cases have only one parent; in most cases, the father is the parent they are lacking. Results of the Rorschach test show that in general subjects have feelings of inferiority, anxiety, and a confusion of sexual impulses; also they are timid, impulsive, immature, and want sympathy and attention.
Duration: July 1962-July 1965.
Investigator(s): Shoji Sanjo, Department of Psychiatry, Iwate Medical College, 87 uchimaru, Morioka-shi, Iwate-ken, Japan. (Reported by NCCD.)
Cooperating group(s): Department of Psychology, Iwate Medical College.

19-JY-1 PHYSICAL CRUELTY IN URBAN AND RURAL DELINQUENTS, AND IN NORMAL BOYS

Purpose: To assess past cruel behavior towards humans and animals in above groups.
Subjects: Twenty rural delinquents, urban delinquents, and normal boys, ages 12 to 16, matched for I.Q. and socio-economic status.
Methods: Interview.
Duration: June-August 1965.
Investigator(s): F. R. Wake, Ph.D., Associate Professor of Psychology, Carleton University, Ottawa, Ont.
Cooperating group(s): Hon. F. A. McGrand, Senate of Canada.
Publication: Expect to publish in the Canadian Psychologist. Two previous articles on the same topic have already been published in this journal.

19-KA-1 CROSS-CULTURAL STUDY OF YOUTH

Purpose: To determine if there is any real differentiation in terms of personality problems between the boy who has no police or court record in contrast to those who have come in conflict with the law.
Subjects: Boys from three ethnic groupings in three cities: Puerto-Ricans from New York; whites from Chicago; and Negroes from Washington, D. C.
Methods: Selection of blocks because of their vulnerability; all families interviewed for census identification; total clearance of family structure obtained; depth interviews with children and youths; resident observers utilized; and records of the following were analyzed; school, welfare, police blotters, correction, juvenile aid bureau, courts, social service clearance, and penal institutions.
Duration: January 1963-June 1965.
Investigator(s): Bernard Lander, Ph.D., Associate Professor of Sociology, Hunter College, and Director of Research, Lavanburg-Corner House, 30 E. 42nd St., New York 17, N. Y. (Reported by Frank J. Cohen, Executive Director,

Lavanburg-Corner House.)
Cooperating group(s): Howard University; Hunter College; and University of Notre Dame.
Publication: Upon completion of the study, it is planned to print a report for national distribution.

19-KA-2 ADOLESCENT MORALITY AND JUVENILE DELINQUENCY: A PSYCHO-CULTURAL STUDY OF MORAL VALUES OF ADOLESCENTS OF A DISTRICT IN MONTREAL

Purpose: To test the hypothesis that given an affluent society in which the material possibilities of achieving a satisfactory status are virtually available to everyone, thanks to free education and community services, it is the sensitivity to different values transmitted by various milieus which engender delinquent or normal behavior, and that sensitivity to values develops more specifically in a particular climate created by family and takes into account the age, level of schooling, socialization, etc.
Subjects: Three groups from a district of Montreal: 225 adults (200 parents and 25 teachers); 250 male adolescents, aged 13 to 18, representing all the adolescent population of the district; and 100 boys between the ages of 6 and 10.
Methods: Administration, by interview, of a questionnaire inspired by those of Scott, Morris and McCord, pertaining to the three levels of analysis: preferential values, moral values, and motivation of behavior.
Findings: Pilot study accomplished in 1964 and 1965 showed that the peculiar value system of delinquent adolescents can be identified with proper measurement.
Duration: June 1965-June 1967.
Investigator(s): Denis Szabo, D.Sc., Director, and Francyne Goyer, M.A., Lecturer, Department of Criminology, University of Montreal, Montreal 24, Que.
Cooperating group(s): Canadian Council on Urban and Regional Research; Department of Family and Social Welfare, Province of Quebec.
Publication: Results of pilot study are in press at *l'Annee Sociologique*, (Paris) Vol. 1964-1965.

19-KA-3 A LONG TERM STUDY OF THE ORIGINS AND DEVELOPMENT OF BEHAVIOR PROBLEMS IN SCHOOLBOYS

Purpose: To investigate associations between personal and background characteristics at an early age and adjustment at adolescence, with special reference to development of juvenile delinquency.
Subjects: 400 school boys, aged 8 to 9, attending state schools within a one-mile radius of an office located in a working-class neighborhood in a large city.
Methods: Cognitive and personality tests, teachers' reports, and physical measures of the boys; home interviews with parents by psychiatric social workers; and data from social and medical records and agencies.
Duration: 1961-1969.
Investigator(s): D. J. West, M.D., D.P.M., Assistant Director of Research, and H. B. Gibson, Ph.D., Research Officer, Institute of Criminology, 7 West Rd., Cambridge, England.
Publication: Expect interim report as monograph in Cambridge Criminology Series, 1967.

19-KA-4 NATIONALITY AND DELINQUENCY

Purpose: To determine extent to which rates of delinquency vary among ethnic, nativity, and racial groups; and to determine extent to which observed differences are products of differential distribution among different types of city areas.
Duration: September 1964-not reported.
Investigator(s): Henry D. McKay, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by NCCD.)
Cooperating group(s): Illinois State Department of Mental Health.

19-KA-5 MASS MEDIA AND JUVENILE DELINQUENCY

Purpose: An inquiry into the relationship between mass media and juvenile delinquency.
Methods: A questionnaire was sent to member countries designed to elicit information about what measures of control existed to protect juveniles from harmful influences in the mass media, how such controls were applied in practice and with what effect, and finally, what scientific studies had been conducted on this question.
Duration: 1962-continuing.
Investigator(s): Council of Europe, Division of Crime Problems, Europe House, Strasbourg, France. (Reported by NCCD.)
Publication: Council of Europe, European Cooperation in 1962, p. 226, and XIVth Report of Committee of Ministers to Consultative Assembly, Strasbourg, 1963 (p.73).

19-KA-6 CHARACTERISTICS OF REJECTING FAMILIES AND THEIR INSTITUTIONALIZED DELINQUENT CHILDREN

Purpose: To study characteristics of institutionalized delinquent children who are completely and overtly rejected by their families, and their families.
Subjects: In-residence cases in institution on December 31 in years 1959 through 1962. These are children who receive not a single card, letter, gift, or visit from home during Christmas holidays. The rest of the institution population either go home on furlough or remain behind but receive letters and gifts.
Methods: Families and their respective delinquent children will be studied utilizing IBM cards from admission and release forms.
Duration: March 1963-continuing.
Investigator(s): Robert Stuckert; Gordon Shipman; and Dean V. Babst, Social Research Analyst, Bureau of Research, Division of Corrections, Wisconsin State Department of Public Welfare, 1 W. Wilson St., Madison, Wis. 53702. (Reported by NCCD.)
Cooperating group(s): University of Wisconsin, Milwaukee.

19-KD-1 DELINQUENCY CONTROL STUDY

Purpose: To derive empirical information about ways in which law enforcement officers, probation officers, delinquent and nondelinquent adolescents perceive their own and each other's roles.
Subjects: 668 police officers from 55 municipal police departments in

Washington; 419 probation officers from 39 county juvenile probation departments in Washington; and 400 adolescents from two Seattle high schools.
Methods: Questionnaires.
Duration: September 1962-August 1965.
Investigator(s): Peter G. Garabedian, Ph.D., Associate Professor and Chairman, Department of Sociology, Washington State University, Pullman, Wash.
Cooperating group(s): President's Committee on Juvenile Delinquency and Youth Crime.
Publication: "The Control of Delinquent Behavior by Police and Probation Officers," paper read at the annual meeting of the Society for the Study of Social Problems, August 30, 1964 in Montreal.

19-KD-2 EXPERIMENTAL USE OF EX-GANG LEADERS AS DETACHED WORKERS IN A YOUTH SERVICE AGENCY

Purpose: A pilot project to test the effectiveness of on-the-job training for five ex-gang leaders working as detached workers in the Youth for Service Agency. It is hoped to demonstrate that these ex-gang leaders can work effectively in such an agency setting, thus providing a new source of needed personnel, and that their experience can provide sharpened training materials and curricula.
Duration: February-July 1965.
Investigator(s): Robert Stone, Ph.D., Institute for Social Science Research, San Francisco State College, 1600 Holloway, San Francisco, Calif.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-KD-3 JUVENILE DELINQUENCY PREVENTION IN CHICAGO: A PROJECT OF THE JOINT YOUTH DEVELOPMENT COMMITTEE

Purpose: To revitalize the process of social control and socialization so that urban residents in one community can be effectively related to people, auspices, and institutions that open opportunities for a better urban life. Such a community promises a meaningful environment for youth and a bulwark against juvenile crime.
Subjects: Children in the community at critical, career-turning points (ages 3 to 6, 12 to 14, and 16 to 18).
Methods: Decentralization of public and private institutional services for the demonstration area through seven programs--education, employment, law enforcement and corrections, health, housing, leisure-time activities, and family neighborhood services; nurturing of a sense of community; renewal and strengthening of institutions; contracting of services through organizations, local and city-wide; and enlistment of full-scale participation of residents on a paid and volunteer basis.
Duration: May 1964-indefinite.
Investigator(s): Charles P. Livermore, Director, and Milton Hyman, M.A., Joint Youth Development Committee, 185 North Wabash Ave., Chicago, Ill. (Reported by NCCD.)
Cooperating group(s): President's Committee on Juvenile Delinquency and Youth Crime.

647

19-KG-1 COMMUNITY TREATMENT FOR DELINQUENTS, PHASE 2

Purpose: Phase 1 of the Community Treatment Project: (1) demonstrated feasibility of substituting an intensive community program for institutionalization of serious delinquents; (2) showed experimental community group to have a higher parole success rate and more positive test score changes (delinquency attitudes) than control institutionalized group; and (3) developed a differential treatment model, defining nine subtypes of delinquents and predicted most effective treatment interventions for each subtype. Phase 2 further describes elements of community program and treatment model, and attempts to delimit aspects of the program most related to success.
Subjects: Delinquents committed to the Youth Authority from two large urban areas.
Methods: Subjects were randomly assigned to one of three groups: E_1, a community unit using differential treatment model; E_2, a community unit following the model of Dr. LaMar Empey's Provo Experiment (Bulletin 6, *Research Relating to Children*); and C, the traditional institution program. Research staff studied comparative effectiveness of three alternative programs in reducing recidivism and in bringing about attitudinal and behavioral changes in various delinquent subtypes.
Investigator(s): Marguerite Q. Warren, Ph.D.; Ted Palmer, Ph.D.; and James K. Turner, Community Treatment Project, California Department of the Youth Authority, 4420 Third Ave., Sacramento 19, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-KG-2 JUVENILE COURT, LAW ENFORCEMENT, AND DETENTION NEEDS IN PINELLAS COUNTY, FLORIDA

Purpose: To determine present status of services and needs for additional facilities and staff; also, to review current policies and practices and to develop suggested changes for more effective service.
Duration: November 1963-May 1964.
Investigator(s): Don Rademacher, Field Consultant, National Council on Crime and Delinquency, Littlefield Bldg., Austin, Tex. (Reported by NCCD.)
Cooperating group(s): Pinellas County Juvenile Court; Pinellas County Juvenile Welfare Board; Pinellas County Junior Chamber of Commerce.

19-KG-3 NATIONAL COUNCIL OF JUVENILE COURT JUDGES: JUDGE-CHILD COMMUNICATIONS STUDY

Purpose: To investigate the young offender's reaction to and understanding of juvenile court proceedings, judge's behavior, and court setting; to lay bare dynamics and results of judge-boy communication and their correspondence with intentions and institutional goals of court.
Methods: Perceptions of juvenile delinquents as well as judge and key court personnel will be studied in two or three courts exhibiting a variety of characteristics in terms of procedure, degree of informality, type of hearing, etc. Special focus will be efficiency and character of communication between judge and child, with identification and analysis of significant variables with respect thereto. Personal interviews (before and after hearing), projective tests, courtroom observation, and follow-up techniques will be used to determine character and accuracy of perceptions, their effect, and implications for structuring and operation of juvenile court process.
Duration: August 1964-August 1965.

Investigator(s): Richard D. Schwartz, Ph.D.; Paul D. Lipsitt, M.S.; and Daniel L. Skoler, National Council of Juvenile Court Judges, American Bar Center, 1155 East 60th St., Chicago 37, Ill. (Reported by NCCD.)
Cooperating group(s): National Council of Juvenile Court Judges; Northwestern University Law and Social Science Program; Walter E. Meyer Research Institute of Law.

19-KG-4 ASSESSMENT OF INTENSIVE PROBATION SUPERVISION OF HARD-TO-PLACE GIRL DELINQUENTS

Purpose: To cope with problem of "hard-to-place" female juvenile court wards accumulating in Juvenile Hall while awaiting suitable placements by assigning them to intensive probation supervision.
Subjects: Four groups of girls, 10 to 15 in each group. These girls exhibited, psychometrically, greater maladjustment than typical girl in either short-term or long-term treatment for disturbed delinquent girls maintained by the Department.
Methods: Four experienced woman deputy probation officers were assigned to the four caseloads. The officers worked with the child, the natural or foster parents, siblings, and other significant persons in effecting workable adjustments to community. Assessment is being carried out by before-after measurements that include repeated administration of a psychological inventory, completion of a performance schedule, submission of quarterly recordings, and analysis of detention histories. Recidivism records of intensive caseload subjects will be compared with those of matched cases from other programs in the Probation Department.
Duration: October 1963-October 1964.
Investigator(s): Stuart Adams, Ph.D., Research Director, and Calvin C. Hopkinson, M.S.W., Los Angeles County Probation Department, Box 4002, Terminal Annex, Los Angeles 54, Calif. (Reported by NCCD.)

19-KJ-1 RESTORATION OF YOUTH THROUGH TRAINING

Purpose: To evaluate efficacy of an IBM skills training program coupled with literacy training, self-management counseling, family referral service, and placement in jobs of known critical manpower shortages on reduction of chronic unemployment and recidivism among young inmates to be released from custody of New York City Department of Correction.
Subjects: 300 youths, randomly selected from a universe of about 3,000 16- to 21-year old inmates committed in a year's time to custody of New York City Department of Correction. Subjects are randomly assigned to experimental group of 150 and matched control group of equal size.
Methods: At seven intervals of two months duration each, approximately 20 to 25 experimental subjects, two months before their scheduled release from custody will be provided with: (1) a 5 to 6 hour per day, 22 day IBM training program; (2) a work program on IBM machines for about 22 days; (3) self-management counseling; (4) family referral services; (5) intensive two hours a day, six days a week program in literacy skills; and (6) vocational placement on IBM skills jobs immediately following release from custody. Quantitative and qualitative research methods will be used to answer several questions concerning efficacy of program.
Duration: November 1963-June 1965.
Investigator(s): Sol Chaneles, Ph.D., Director, Research and Planning Division, New York City Department of Correction; and Harry M. Shulman, Ph.B., Professor of Sociology, The City College, City University of New York, New York, N. Y. (Reported by NCCD.)

649

Cooperating group(s): International Business Machine Corporation; Office of Manpower, Automation, and Training, U. S. Department of Labor.

19-KJ-2 VOCATIONAL REHABILITATION IN JUVENILE DELINQUENCY

Purpose: To gather basic information regarding scope and extent of problem of juvenile delinquency in Oklahoma, resources available in dealing with it, and ways in which various agencies can be more effective in coping with it; and to define role of vocational rehabilitation in this area.
Duration: July 1963-June 1964.
Investigator(s): James A. West, Chief of Special Services, and Don Keith, Vocational Rehabilitation Division, Oklahoma State Board for Vocational Education, State Capitol Station, Oklahoma City 5, Okla. (Reported by NCCD.)
Cooperating group(s): Vocational Rehabilitation Adminstration, U. S. Department of Health, Education, and Welfare.

19-KM-1 ADDITIONAL PROCESSES IN CONTINUING CLASSES AT JUVENILE HALL

Purpose: To determine whether or not classes at Juvenile Hall can accompolish remedial education in basic subjects or a change of attitude; to assess the role of group counseling as a factor in re-education.
Subjects: Those committed to Juvenile Hall for detainment of 30, 60, or 90 days.
Methods: Pretesting to determine range of abilities and capacities and aptitudes in reading, writing, arithmetic, and language arts: adjusting curriculum to meet needs on an individual basis; and grouping for instruction.
Duration: January 1964-June 1966.
Investigator(s): Ernest Poore, B.A., Assistant Superintendent, Fresno County Schools, 2314 Mariposa St., Fresno, Calif. 93721.
Cooperating group(s): Superior court judge; Juvenile Justice Commission; county probation officer.
Publication: Data available from investigator upon request.

19-KM-2 USE OF OPERANT TECHNIQUES TO IMPROVE THE SCHOOL PERFORMANCE OF A GROUP OF INSTITUTIONALIZED DELINQUENT BOYS

Purpose: To develop motivation for improved academic performance.
Subjects: 19 institutionalized boys ages 13 to 15 committed by the State of Washington.
Methods: Five evenings a week boys in an institutional living unit were given an opportunity to watch a television news program. The following day in school they were given a 10-item, true-false test based on contents of this program. Grades on this test were made available to them on special grade sheets. The youngsters returned to living unit in the afternoon with these grade sheets and were paid in tokens depending upon their performance on this test. Tokens were redeemable for usual institutional canteen items, candy, gum, etc.
Findings: The group showed a statistically significant ($P < .01$) improvement in test performance for the 24 days on this program as compared with a previous period when reinforcement was not contingent on this behavior.
Duration: January-August 1965.
Investigator(s): Vernon O. Tyler, Jr., Ph.D., Chief Psychologist, and

G. Duane Brown, M.A., Research and Clinical Psychologist, Fort Worden Treatment Center, Port Townsend, Wash.
Publication: Paper planned for reading at a psychological meeting and for later publication.

19-KM-3 THE IMPACT OF SWIFT, BRIEF ISOLATION ON DELINQUENT BEHAVIOR

Purpose: To develop a procedure for controlling unacceptable behavior of institutionalized delinquent youngsters using swift, mild punishment.
Subjects: Institutionalized delinquent boys ages 13 to 15 committed by the courts of the State of Washington.
Methods: Pool table misbehavior (breaking rules, throwing cue, scuffling) of boys in a training school cottage was controlled by making isolation contingent on it. Cumulative records from an ABA (isolation; verbal reprimand; isolation) contingency design showed decreasing rate during A and rapid recovery during B.
Findings: The contingency controlled misbehavior, but resistance to extinction and generalization to other behaviors and situations outside the cottage remain for study.
Duration: May 1964-July 1965.
Investigator(s): Vernon O. Tyler, Jr., Ph.D., Chief Psychologist, and G. Duane Brown, M.A., Research and Clinical Psychologist, Fort Worden Treatment Center, Port Townsend, Wash.
Publication: Currently in mimeograph form. Accepted for reading at American Psychological Association Convention, Chicago, 1965. Plan to publish later.

19-KM-4 USE OF OPERANT TECHNIQUES TO IMPROVE THE ACADEMIC PERFORMANCE OF A SCHOOL-RESISTANT DELINQUENT BOY

Purpose: To develop improved academic performance in a delinquent boy.
Subjects: One manipulative, delinquently-identified, 16-year old boy with an I.Q. of 108 committed for stealing four cars. Reports state he feels "dumb" in school and resists it.
Methods: Daily and weekly school grades were reinforced with tokens exchangeable for "renting" a mattress, preferred clothing, and canteen "goodies."
Findings: With reinforcement, semester grades improved from .825 to 3.00. Teachers reported subject worked hard for tokens despite school-resistant attitude.
Duration: June 1964-April 1965.
Investigator(s): Vernon O. Tyler, Jr., Ph.D., Chief Psychologist, Fort Worden Treatment Center, Port Townsend, Wash.

19-KM-5 A COMBINED HALFWAY HOUSE-VOCATIONAL TRAINING PROGRAM FOR DELINQUENT BOYS

Purpose: To demonstrate that nonschool-oriented delinquent boys from MacLaren School can be more effectively integrated back into community living through a combined halfway house-vocational training program in Portland which will provide a less structured environment than the institution.
Methods: Group and individual counseling and involvement of families; intensive vocational training and job placement program through the Youth

Opportunities Center, a division of the Oregon State Employment Service; remedial education for those boys with less than a seventh-grade achievement level; and evaluation of community performance of project boys with boys in two control groups.
Duration: February 1965-January 1966.
Investigator(s): Amos E. Reed, Superintendent, MacLaren School for Boys, Oregon State Board of Control, Route 1, Box 37, Woodburn, Oreg.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-KM-6 HORIZON HOUSE, INC.

Purpose: A demonstration project to help children of normal intelligence who are in conflict with authority and are educationally poor achievers.
Subjects: 15 boys between the ages of 13 and 16, and a matching control group from the local juvenile court.
Methods: Subjects are entered in a four-part program consisting of casework services to the child and parents, planned recreation, instruction in remedial reading, and field trips to cultural attractions, sporting events, and to businesses and industries. Sample and control groups will be carefully evaluated diagnostically on before-and-after basis in an effort to identify effective methods of treating this type of child. Standardized and projective tests, as well as clinical observations, will be used to obtain data.
Duration: September 1964-June 1967.
Investigator(s): Lorenz Villeponteaux, Jr., Director, and Rosa Strait, Horizon House, Inc., 14 Green St., Charleston, S. C. (Reported by NCCD.)
Cooperating group(s): Junior League of Charleston, Inc.; South Carolina Mental Health Commission; South Carolina Vocational Rehabilitation Office.

19-KM-7 EVALUATION OF AN INSTITUTIONAL PROGRAM IN RELATION TO AFTER-CARE OF RELEASED CHILDREN UNDER THE BOMBAY CHILDREN ACT, 1948, AND ITS CORRELATION WITH THE SOCIAL BACKGROUND AND THE BEHAVIOR PATTERN GROUPS AT THE STAGE WHEN THEY WERE REFERRED TO THE JUVENILE COURTS

Purpose: To evaluate institutional program in relation to preparation of inmates for after-care and successful rehabilitation on background of causes for which child was referred to juvenile courts.
Subjects: 200 cases of after-care from the Greater Bombay area and 200 cases from the rural area of Poona District, selected by random sampling from references made to juvenile courts.
Methods: Various official records and documents on each subject will be examined in order to get a present picture of personality of the child after his term of treatment in institutional training program. Case-study method of personal interviews of each child will also be used.
Duration: 1964-1966.
Investigator(s): S. D. Gokhale, Assistant Director, Department of Social Welfare of Maharashtra State, 3 Church Rd., Poona 1, India. (Reported by NCCD.)
Cooperating group(s): Maharashtra State Probation and After-Care Association; Department of Social Welfare of Maharashtra State.

19-KM-8 TRAVERSE YOUTH CENTER -- GENESEE COUNTY, MICHIGAN JUVENILE COURT DEMONSTRATION PROJECT: A MULTI-ENTRY TREATMENT APPROACH WITH INDIVIDUAL, PEER GROUP, AND FAMILY

Purpose: To define and delineate treatment process in action, its operation and impact; to evaluate the total impact on delinquents as compared to matched controls for whom no special treatment program is available; and to develop predictive measures for continued recidivism among repeated offenders.

Subjects: Repeated juvenile offenders, ages 14 to 17, and matched controls.

Methods: Subjects will receive community-based treatment and training. Observations, ratings of behavioral and attitudinal change, individual perceptional measures and performance measures will be obtained for each phase of treatment for delinquents, parents, and three-family units. Three dependent variables will be the foci for analysis: the delinquent behavioral output within the treatment program; the delinquent behavioral output outside the treatment program; and attitudinal and perceptional movement within the individual. Where appropriate, similar data will be collected for matched control delinquents.

Duration: September 1962-August 1965.

Investigator(s): Ross M. Peterson, Director; and George D. Stevens, Traverse Youth Center, 434 W. 4th Ave., Flint; Jean W. Butman, Ph.D., and Ronald Lippitt, Ph.D., Professor of Sociology and Psychology, Institute for Social Research, University of Michigan, Ann Arbor, Mich. (Reported by NCCD.)

Cooperating group(s): Flint Youth Study, Institute for Social Research; Flint Mental Health Clinic; Flint Park and Recreation Department; Genesee County Probate Court; Genesee County Board of Supervisors; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-KM-9 "THERAPEUTIC OPEN INSTITUTIONAL TREATMENT" AS A METHOD OF THERAPY AND AN EVALUATION OF ITS EFFECT IN A JUVENILE DETENTION AND CLASSIFICATION HOME

Purpose: To relieve the anxiety and mental tension of juvenile delinquents detained in an institution pending judgment, and to enable them to gain insight into their own problems by what is called "therapeutic open institutional treatment."

Subjects: 100 boys detained in an institution.

Methods: Treatment involves establishing a definite rhythm for subject's time in detention, releasing them from their cells during the day and enabling them to have a quiet time during the night for introspection. Subjects are given mental and physical recreation, and visual and auditory education in order to stimulate their self-insight. They engage in painting, clay work, plastering, dairy farming, writing, and music appreciation in addition to gymnastics, baseball, tennis, volley ball, and ping pong, and receive individual counseling and guidance. To evaluate treatment, various questionnaires and psychological tests are given to subjects.

Findings: Anxiety and mental tension of subjects were found to be appreciably alleviated within 14 days after admission. The boys, in the majority, approved of the treatment and participated in it. Results from a modified Taylor anxiety test showed that stability of emotion, behavior, and human relations in detention life were recovered after 20 days. Results from the TAT showed no statistically significant differences. However, some decrease in rejection and improvement in passive attitudes can be considered the result of this treatment.

Duration: April 1961-1964.

Investigator(s): Teruo Abe, 5-40, Suketo-Honcho, Tokushima-shi, Tokushima, Japan. (Reported by NCCD.)

Cooperating group(s): Tokushima Juvenile Detention and Classification Home.

Publication: Shikoku Kyosei Kagaku, No. 16, 1962 (Shikoku Correctional Science, a periodical issued from Takamatsu Correction District Headquarters.)

19-KM-10 STUDY OF THE EFFECT OF MUSIC ON GROUPS IN CORRECTIONAL INSTITUTIONS

Purpose: To test effect of the use of music therapy on juvenile delinquents held in a detention and classification home.
Findings: Delinquents seem to have poor musical ability and their appreciation of music is below that of control groups two or three years younger. In particular, they lack rhythm, melody, and harmony. Their favorite music has a quick rhythm. Slow music seems to wake too many recollections. Soft music, Japanese children's songs, and folk songs were found to have a softening effect on them and were effective in preparing them for sleep. Using music as a signal for waking up was also effective.
Duration: April 1962-March 1964.
Investigator(s): Ryota Kobayashi, 484 Nishitachibana-cho, Matsuyama, Ehime Prefecture, Japan. (Reported by NCCD.)
Cooperating group(s): Matsuyama Juvenile Detention and Classification Home.

19-KM-11 DEVELOPMENT OF BASE EXPECTANCIES FOR OFFENDERS RELEASED FROM WISCONSIN JUVENILE CORRECTIONAL INSTITUTIONS

Purpose: To evaluate treatment results taking into account the differential risk groups involved in treatment of various types; to identify these risk groups.
Subjects: All boys and girls first released from Wisconsin juvenile correctional institutions during the calendar years 1959 and 1960.
Methods: Each released offender will be followed up on aftercare for one year.
Duration: March 1963-continuing.
Investigator(s): John W. Mannering (deceased); Dean V. Babst, Social Research Analyst; and Maurice E. Hubble, Bureau of Research, Division of Corrections, Wisconsin State Department of Public Welfare, 1 W. Wilson St., Madison, Wis. 53702. (Reported by NCCD.)

19-KP-1 THE NATURE OF THERAPEUTIC CHANGE IN ADOLESCENT DELINQUENT BOYS

Purpose: To evaluate and analyze nature of therapeutic change resulting from a successfully completed psychotherapeutic program for adolescent delinquent boys which combined vocational counseling, educational assistance, and psychotherapy; to relate the various aspects of ego functioning in an effort to determine areas of psychotherapeutic change; and to derive reliable and valid scales for measurement of change in personality functioning.
Subjects: 20 adolescent delinquent boys who had just been suspended or had withdrawn from school.
Methods: Results from I.Q. tests, four achievement tests, and a series of thematic stories were obtained from subjects. 10 of the subjects received a new program of treatment, which lasted for 10 months. Thematic stories were obtained in three general areas: self-image, attitude toward authority, and control of aggression. Various scales were devised for analysis of time perspective, guilt, object relationships, and quality of response.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-KP-2 A SHORT-TERM GROUP REHABILITATION PROGRAM FOR DELINQUENT AND PREDELINQUENT ADOLESCENTS

Purpose: To establish a specialized short-term, educationally based, group rehabilitation program for delinquent and predelinquent boys who are potential dropouts. Aims include the reorientation of attitudes and conduct in acceptable social directions; motivation to continue school; provision of assistance in gaining educational skills and attitudes necessary for successful completion of academic and/or vocational programs; and the encouragement of integration of community services with university and educational programs in accomplishing these aims.
Subjects: 14- and 15-year old boys referred by the juvenile court and schools on the basis of behavioral and scholastic problems.
Methods: Remedial instruction from Newark State College; guided group interaction therapy through Essexfields Group Rehabilitation Center; and supportive, guidance, and therapeutic services for boys and their parents from the Family Service Bureau.
Duration: February 1965-February 1966.
Investigator(s): Dr. Saul Pilnick, Welfare Federation of Newark, 45 Branford Pl., Newark, N. J. 07102.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-KP-3 REHABILITATION PROGRAM FOR HARD-CORE, ADOLESCENT OFFENDERS

Purpose: An experimental attempt in a junior high school to deal with hard-core 13.5- to 15.5-year old male offenders in Louisville by attempting to establish a conventional culture with norms and values that will lead the boys to conventional behavior, school adjustment, and nondelinquent goals.
Methods: Guided group interaction, half-day revised educational plan with remedial assistance, half-day work, aggressive intensive family casework, and weekly parental group counseling.
Duration: February 1965-February 1966.
Investigator(s): John M. Wall, Kentucky Child Welfare Research Foundation, Inc., Capitol Annex, Frankfort, Ky.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-KP-4 IDENTIFICATION CHOICE OF DELINQUENT ADOLESCENTS IN CHANGING CULTURES

Purpose: To develop a program of action which would be calculated to supply positive identification choices in a group of early adolescents. Previous studies have seemed to indicate that the identification choice of adolescents

is a powerful factor in the production of delinquency.
Methods: Thorough investigation of this phenomenon in Roxbury, Massachusetts, Honolulu, and perhaps one or more other appropriate settings.
Duration: 1963-continuing.
Investigator(s): Shepard C. Ginandes, M.D.; and Donald Hayes Russell, M.D., 4909 Kalanianaole Highway, Honolulu, Hawaii. (Reported by NCCD.)

19-KP-5 AN EVALUATION OF THE EFFECT OF GROUP COUNSELING IN CORRECTIONAL INSTITUTIONS

Purpose: To study effect of group counseling on girls at the Aiko Training and Reformatory School.
Subjects: Nine girls, aged 15 to 16, with I.Q.'s of 71 to 118, who had been in the institution two to 10 months, were given group counseling.
Methods: Counseling sessions were given one hour per week for 20 weeks. Spoken record of counseling sessions was analyzed and relation between various occurrences in each session and improvement of behavior in the institutions was noted.
Findings: As sessions progressed, self-insight progressed and the girls' feelings changed from negative to positive because of relief and dissolution of tension and recognition by the girls of their own emotions during the sessions. Other significant changes and improvements were noted and applied to other treatment measures.
Duration: April 1960-December 1964.
Investigator(s): Yoshie Miyamoto, 21138 Nakamachi, Nerima-ku, Tokyo, Japan. (Reported by NCCD.)
Cooperating group(s): Tokyo Juvenile Detention and Classification Home.

THE CHILD IN THE FAMILY

Family relations

19-LA-1 FAMILY PATTERN AND PERSONALITY DEVELOPMENT

Purpose: To study relationship between recalled patterns of family interaction and disciplinary experiences and scores on questionnaire tests of personality.
Subjects: 250 college students.
Methods: Questionnaires; correlational and factor analysis, analysis of variance.
Findings: Recalled consistency of discipline is positively related to low scores on an anxiety measure.
Duration: 1956-not reported.
Investigator(s): Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill.

19-LA-2 FAMILY INTERACTION, COALITION, DISAGREEMENT, AND COMPROMISE IN PROBLEM, NORMAL, AND SYNTHETIC FAMILY TRIADS

Purpose: To compare above-indicated triads in a competitive game and a family-relevant questionnaire situation.
Subjects: 12 triads of each kind ("problem"...father, mother, and delinquent son; "normal"...father, mother, and nondelinquent son; and "synthetic"...father, mother, and son from different families.)
Methods: Each triad played a series of games under three different "power patterns"; similarly, each triad answered a series of questions, first by indicating positions independently by members, then by discussion, resolving differences.
Findings: No consistent pattern of differences in strategy or outcomes on the game, although significant differences on a number of variables. On the questionnaire, synthetic families disagreed most initially and compromised most. Other findings showed differences between problem and normal families, as well as between each of these and synthetic families.
Duration: Fall 1964-not reported.
Investigator(s): Arthur M. Bodin, Ph.D., Research Psychologist, Mental Research Institute, Palo Alto Medical Research Foundation, 860 Bryant St., Palo Alto, Calif. (Reported by W. Edgar Vinacke, Ph.D., Department of Psychology, State University of New York at Buffalo, Buffalo, N. Y. 14214.)
Cooperating group(s): State University of New York at Buffalo; Office of Naval Research, U. S. Department of Defense.
Publication: Journal publication planned.

19-LA-3 STUDY ON POSTPARTUM SEPARATION AND DISTURBANCES IN MOTHER-CHILD RELATIONSHIP

Purpose: To obtain information concerning the psychodynamics of the postpartum period, and the breakdown of the mother-child relationship in the early postpartum weeks.

657

Subjects: Systematic sample of mothers and babies delivered at Baltimore city hospitals in 1960 and 1961.
Methods: Statistical evaluation of information from birth certificates, charts, prenatal record, social services and house visit information and interviews.
Findings: Every fifth mother goes home leaving a live baby behind for hospital care or for adoption. Length of necessary separation depends on status of child. In a large percentage an additional unnecessary delay occurs in re-establishing mother-child relationship. Causes for such delay and associated sociological data are under investigation.
Duration: 1961-1965.
Investigator(s): Frederick M. Zerzavy, M.D., M.P.H., Lecturer, Department of Maternal and Child Health, Johns Hopkins University School of Hygiene and Public Health, Baltimore 5, Md.
Cooperating group(s): Baltimore City Hospital; Department of Vital Statistics, Baltimore City Welfare Department.
Publication: Study will be submitted as thesis in 1965; a second paper on the sociology of prematurity is planned for submission as a monograph to the Johns Hopkins University Press.

19-LA-4 FAMILY DIAGNOSES AND FUNCTIONS

Purpose: To identify characteristics of families which are associated with poor school adjustments of children, and with social deviance of children.
Subjects: Families of elementary school-age children.
Methods: Based on a search of the literature, interview procedures and related rating procedures have been developed for family interviews. Observers make ratings independently.
Duration: September 1964-August 1967.
Investigator(s): Lucy C. Rau, Ph.D., and C. Leland Winder, Ph.D., Professor and Chairman, Department of Psychology, Michigan State University, East Lansing, Mich. 48823.
Publication: Publication will be in a standard psychological journal provided results seem to be a contribution to knowledge.

19-LA-5 RELATIONS BETWEEN PARENTAL ATTITUDES, PERSONALITY CHARACTERISTICS, AND MARITAL ADJUSTMENT AND AGGRESSION IN PRESCHOOL CHILDREN

Purpose: To explore relations between specified parental variables and children's aggression; to evaluate a time-sample observation method as a means of studying young children; and to investigate sex differences in aggressive behavior of young children.
Subjects: 36 laboratory preschool children and their parents.
Methods: For the children, two-minute time sample observations in the preschool setting; for the parents, group administration of the Parent Practices Research Scale, Locke Marital Adjustment Scale, and Terman Self-Rating Happiness Scale.
Duration: March 1963-December 1964.
Investigator(s): E. Duwayne Keller, Ph.D., Assistant Professor, and Eleanore Braun Luckey, Ph.D., Professor and Head, Department of Child Development and Family Relations, University of Connecticut, Storrs, Conn.
Cooperating group(s): University of Connecticut Research Foundation.
Publication: Publication in a professional journal is anticipated.

19-LA-6 LONGITUDINAL STUDIES OF PARENT-CHILD RELATIONSHIPS

Purpose: To follow longitudinally the development of particular behaviors: early sexual behavior, development of attachments to people and objects, body image and sexual role differentiations, breast feeding variations and significance, origins of phantasy in the young child, the child's tie to the father as well as the mother, and origins of creativity.
Subjects: A small number of children in their family settings.
Methods: Utilization of parental observational recorded data supplemented by frequent observations by the author, and periodic infant tests.
Duration: February 1962-1970.
Investigator(s): James A. Kleeman, M.D., Psychoanalyst in private practice, and (Assistant Clinical Professor of Psychiatry, Yale University, School of Medicine,) Bethmour Rd., Bethany, Conn.

19-LA-7 ULCERATIVE COLITIS AND FAMILY INTERACTION

Purpose: To study the interaction of a small sample of families in which a child has ulcerative colitis, and to determine if families appear to have anything in common which would be part of the etiology of ulcerative colitis.
Subjects: Eight white, upper middle class families with children between ages of 8 and 16 in which one of the children has had acute and chronic ulcerative colitis diagnosed by X-ray and laboratory findings.
Methods: The families were seen in 5 to 12 interviews, including a structured interview and the Haley-Ferreira Interactional Measurement. In addition to analyzing interaction in the structured interview, the response of the family to a therapy-type setting, and the findings of a detailed historical method questionnaire were noted.
Findings: The eight families, although a small sample, were suprisingly uniform in the more obvious patterns of interaction and in much of their social data. They all showed marked restrictiveness and an amazing amount of social isolation, considering their ethnic groups, income, etc.
Duration: January 1964-December 1967.
Investigator(s): Don D. Jackson, M.D., Director, Mental Research Institute, Palo Alto Medical Research Foundation, 860 Bryant St., Palo Alto; and Irvin D. Yalom, M.D., Assistant Professor of Psychiatry, Stanford University, Stanford, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: A paper is in preparation to be published in *Psychosomatic Medicine*.

19-LA-8 HEALTH ORIENTATIONS OF PARENTS AND CHILDREN

Purpose: To investigate health orientations of family members; to characterize, in a systematic fashion, patterns of variation in family members' attitudes, values, beliefs, perceptions, and behavior concerning phenomena of illness and health; and to examine ways in which selected personal and situational factors relate to health orientations.
Subjects: 200 hospitalized children and their mothers.
Methods: Information on subjects was obtained by use of focused interviews, questionnaires, and rating scales, along with ratings made by nurses who have observed the child in the hospital setting.
Duration: Not reported-1967.
Investigator(s): John D. Campbell, Ph.D., and Margaret D. Vogel, Social

Science Analysts, Laboratory of Socio-environmental Studies, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

19-LA-9 PATTERNS OF FAMILY INTERACTION: THE FAMILY RORSCHACH STUDY OF NORMAL FAMILIES

Purpose: To standardize a new technique for identifying and describing patterns of family interaction, the Family Rorschach; to compare family interaction patterns in normal and different types of abnormal families; and to test the hypothesis that the nature of specific psychiatric disorders seen in adolescents is significantly related to the nature of the family interaction.

Subjects: 10 normal control families individually matched for age, sex, education, and socio-economic status with 10 each of families having offspring with two different kinds of schizophrenic and two different kinds of neurotic symptomology.

Methods: Family Rorschach is administered to subjects, preceded by an individually-administered battery of psychological tests and followed by a structured interview.

Investigator(s): Nathene Loveland, Ph.D., Chief Psychologist, Family Studies Section, Adult Psychiatry Branch, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

19-LA-10 AN INVESTIGATION OF THE CHILD'S PERCEPTION OF PARENT BEHAVIOR

Methods: An inventory consisting of 26 scales was developed to collect data on the child's perception of parent behavior. Reports of parent behavior and self-reports of adjustment were collected.

Findings: Highly significant differences were found between descriptions of mothers and fathers and between groups of subjects. A factor analysis revealed a major factor of Acceptance vs. Rejection that included more than half of the common factor variance and two control factors: Psychological Autonomy vs. Psychological Control and Firm Control vs. Lax Control. Significant correlations were found between several maladjustment scales and reports of hostile detachment of fathers and hostile involvement of mothers. Psychological control scales--Intrusiveness, Control through Guilt and Possessiveness, also show significant correlations with adjustment.

Duration: Not reported-1965.

Investigator(s): Earl S. Schaefer, Ph.D., Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

19-LA-11 INVESTIGATION OF A VARIETY OF PROBLEMS AMONG CHILDREN IN LARGE FAMILIES

Purpose: To study the conditions in the homes of large families today.

Subjects: 700 to 800 large families throughout the United States.

Methods: Questionnaires.

Duration: September 1963-September 1967.

Investigator(s): Sister Mary Amatora, O.S.F., Ph.D., Chairman, Department of Psychology, St. Francis College, 2705 Spring St., Fort Wayne, Ind. 46808.

Publication: Publication planned in psychological journals.

19-LA-12 METHODOLOGY OF FAMILY INTERACTION

Purpose: To devise appropriate methodology to compare child personality and family interaction.

Subjects: Ninth grade pupils selected at random.

Methods: Scales; structured interviews with parents; home visits; and Leary Interpersonal Checklist (modified by Terrill).

Findings: Good rater agreement on scales and on Interpersonal Checklist.

Duration: September 1964-December 1965.

Investigator(s): Don D. Jackson, M.D., Director; Jules Riskin, M.D., Associate Director; James Terrill, Ph.D.; Janes Beavin, B.A.; and Carlos Sluzki, M.D., Research Associates, Mental Research Institute, Palo Alto Medical Research Foundation, 860 Bryant St., Palo Alto, Calif.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: To be published in *Family Process* and *Archives of General Psychiatry*.

19-LA-13 PARENTS' FEELING OF ADEQUACY RELATED TO THEIR CHILDREN'S MENTAL HEALTH

Purpose: To investigate relationships between various measures of home and parent variables and various child measures.

Subjects: 100 children and parents in current longitudinal study at the Institute.

Methods: Parents are given a Q-sort (self-ideal) test of parent attitudes, constructed by staff at the Institute, and the Grapko adult security test. An estimate of the home environment is being devised. Children are given a battery of tests which include Institute security tests at several age levels, the Northway sociometric tests, measures of intelligence, creativity, and conceptual and perceptual motor development.

Findings: Findings based on results from 37 fathers and 39 mothers suggest that there is a slight tendency for the mothers to feel more adequate as parents than fathers, but that fathers may have higher mental health quotients than mothers. These findings await the addition of further cases to be confirmed.

Duration: 1962-1973.

Investigator(s): Nan Foster, M.A., Lecturer, Institute of Child Study, University of Toronto, Toronto, Ont.

Cooperating group(s): Ontario Mental Health Foundation.

Publication: *Mental Hygiene* 43:3, July 1959. *Bulletin of the Institute of Child Study*, Nos. 102-103, Winter 1964-65. Progress of the study to be reported in the Bulletin and in other Institute publications.

19-LA-14 AN INTERVIEW STUDY OF PARENTS OF ANXIOUS AND DEFENSIVE BOYS

Purpose: To follow up previously reported research on defensive behavior of parents during an interview situation, as related to their son's score on the Test Anxiety Scale for Children; to further delineate such defensive behavior in terms of its relative manifestations in mothers versus fathers, and its relationship to children's scores on the Defensiveness Scale for Children; and to investigate the life experiences of test anxious and defensive boys, their parents' evaluations of them, and some characteristics of the parent-child relationship.

Methods: Independent, standardized interviews were conducted with mothers and fathers of third grade boys.

Findings: This study raised methodological questions concerning the

usefulness of parental reports as data on child-rearing practices and attitudes. It led to revisions in the conceptions of the parent-child relationship of test anxious versus defensive boys that are to be pursued in further work.
Investigator(s): Sheila C. Feld, Ph.D., Mental Health Study Center, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, 2340 University Blvd., East, Adelphi, Md.; Seymour B. Sarason, Ph.D., Professor of Psychology, Yale University, New Haven; and Wayne A. Owen, Ph.D., Staff Psychologist, Institute of Living, 200 Retreat Ave., Hartford, Conn.

19-LD-1 EFFECT OF INCARCERATION ON THE FAMILY

Purpose: To determine the effect upon the structure and function of the family when the husband and father goes to prison; to discover who assumes this new responsibility; to determine how the families support themselves during the absence of the working member; and to determine the most stressful and traumatic periods that the process of incarceration brings to the family.
Subjects: 91 married, male parolees, who had served at least one year in prison and were still under parole supervision in the State of Florida on May 1, 1963.
Methods: Questionnaires were prepared and pretested for use in field interview situations. From May through August 1963, the principal investigator and four graduate students traveled throughout Florida interviewing parolees, their supervising parole officers, and their wives and children. Relatives, employers, teachers, and cooperating community agencies were also interviewed. More than a thousand separate interviews were done to complete the study.
Findings: The wives and children, together with parents, brothers, and sisters of both the husband and the wife, rose to the occasion and carried the added burdens, both emotional and financial, that incarceration of the husband-father brought. While the effects of incarceration were disturbing to both the prisoner and his family, a surprisingly large percentage came through unscathed and, in many cases, a traumatic experience became a strengthening experience.
Investigator(s): George G. Killinger, Ph.D., Professor of Criminology and Corrections, Florida State University, Tallahassee, Fla.
Cooperating group(s): Florida Council on Research and Training in Mental Health.
Publication: Probably will be published in Federal Probation.

19-LD-2 COMPOSITION AND STRUCTURE OF THE NEGRO FAMILY

Purpose: To discover why Negro fathers apparently are more likely to remain in the home if they have male children.
Methods: Negro mothers were interviewed at length as they brought their children to the Charity Hospital clinic. Sixty-two Negro women, randomly selected, were interviewed in their own homes. Cases from the Family Service Association (36 Negro and 25 white) were reviewed for differences in family problems in the two racial groups.
Findings: Hypotheses have been formulated from the above data as to possible causes for husbands being more likely to remain in homes where there are sons: (1) demographic hypothesis--the possibility that more females are born into disturbed family situations; (2) father-son identification hypothesis--tendency to form one-sex alliances in Negro families;

(3) fear of femininity hypothesis--presence of too large a proportion of females is threatening to male identity; and (4) intermediate object hypothesis--role of father to a son binds the Negro male into the family structure. Without this role, he has no secure place in the family.
Duration: September 1964-indefinite.
Investigator(s): Ann Fischer, Ph.D., Associate Professor, Department of Sociology and Anthropology, Tulane University, New Orleans, La.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Two papers have been delivered but are not yet published.

19-LD-3 FAMILY STRUCTURE AND THE HEALTH OF CHILDREN

Purpose: To provide a broad range of population parameters for the health of children in general; to assess quantitative and qualitative differences between health of adopted and nonadopted children; to provide basic information for social planning and social action in health and welfare fields; to investigate the relationship between social mobility of parents and adequacy of functioning of their children; and to test several theories advanced in the literature in order to obtain leads on the etiology of observed difficulties of functioning.
Subjects: Stratified random sample of families with children between ages 3 and 16.
Methods: Interviewing supplemented by data from records kept in governmental agencies, hospitals, and schools.
Duration: 1963-1967.
Investigator(s): H. David Kirk, Ph.D., Professor of Sociology, University of Waterloo, Waterloo, Ont.; and Kurt Jonassohn, M.A., Associate Professor of Sociology, Sir George Williams University, Montreal, Que.
Cooperating group(s): Foundations' Fund for Research in Psychiatry; Mental Hygiene Institute of Montreal; Department of Public Welfare, Halifax; Dalhousie Medical School, Halifax; University of Exeter, England; Department of National Health and Welfare, Ottawa.
Publication: Results will be published as available, probably in articles and monograph.

19-LD-4 FERTILITY, ATTITUDES RELEVANT TO FERTILITY, AND FAMILY STRUCTURE IN METROPOLITAN NEW ORLEANS

Purpose: To determine the extent of knowledge about, and attitudes toward, fertility and family planning; to assess fertility and sterility; and to study the changing composition of the family over the lifetimes of the respondents and to evaluate the reasons for and significance of these changes.
Subjects: 1,000 ever-married (including common-law) persons, and ever-pregnant women, who have not yet reached their forth-fifth birthday, randomly selected from the New Orleans Standard Metropolitan Statistical Area.
Methods: Subjects will be interviewed. Data obtained, in addition to permitting an investigation of these three topics, will enable investigators to make comparisons of fertility, fertility attitudes, spacing of children, etc., between various types of families in sample, and to document relationships between these fertility factors and family instability.
Duration: 1964-1969.
Investigator(s): Joseph D. Beasley, M.D., Assistant Professor of Child Health, Tulane University School of Medicine, 1430 Tulane Ave., New Orleans,

La. 70112.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-LD-5 RELATIONSHIP OF MATERNAL HEALTH TO FAMILY SOLIDARITY AMONG LOW-INCOME FAMILIES IN 23 APPALACHIAN COUNTIES

Purpose: To determine the impact that long-term or chronic illness has on financially depressed families; to examine family adjustments to maternal illness in light of community resources available to families in the Appalachian counties of Ohio; and to examine the effect that the family's concept of mother's competence to perform her role will have on the mother's desire to regain full productivity.
Investigator(s): Christine H. Hillman, Ph.D., Professor and Head, Division of Family and Child Development, and Ann S. Bardwell, Assistant Project Director, School of Home Economics, Ohio State University, Columbus, Ohio.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-LG-1 MATERNAL EMPLOYMENT AS A POSITIVE REACTION OF THE MODERN URBAN MIDDLE CLASS MARRIED WOMAN TO THE SITUATION OF ANOMIE

Purpose: To determine the relationship of maternal employment to familial patterns in middle class urban families and, more specifically, to examine whether organization of family life in terms of its major tasks is significantly different in families where mothers work from in families where they do not.
Subjects: 40 middle class urban married women, 20 of whom were employed and 20 not employed. In each group 10 mothers had completed only high school education and 10 had completed a college degree or beyond. Every woman had at least two children, none of whom were preschoolers, and all women were living with their husbands in a first marriage.
Methods: Case method; intensive interview in the home of each mother; spot interviews with other members of the family when available.
Findings: The major reason married women work is in order to fulfill the role of economic help-mate to their husbands; those who do not work do not because there is no economic need for their employment. There is no significant difference in the organization of family life where mothers are employed and where they are not. The perception of the meaning of work and the degree of satisfaction with one's life is a function of one's socio-economic class.
Duration: 1960-spring 1964.
Investigator(s): Rosemary Higgins Cass (Ph.D. Candidate, Fordham University), 434 Franklin St., Bloomfield, N. J.
Publication: Possible publication as a study in family life and/or social change. Interested persons may consult author.

19-LJ-1 FAMILY STUDY PROGRAM: POWER DISTRIBUTION PATTERNS IN CLINIC AND NONCLINIC FAMILIES

Purpose: To explore the relationship of family power patterns to the development of emotional disturbance in children, and the differential characteristics of patterns of power distribution in families of pathologically withdrawn and aggressive children.

Subjects: 40 intact middle class families with adolescent children of normal intelligence, equally divided between those having had and those not having had a child with diagnosed emotional disturbance.
Methods: Analysis of data generated by Bales scored family interaction using Strodtbeck's Revealed Differences instrument.
Duration: January 1963-January 1966.
Investigator(s): Solomon Kobrin, M.S., Chief, Division of Social Systems Analysis, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)
Cooperating group(s): Social Psychology Laboratory, University of Chicago.
Publication: Journal articles planned.

19-LJ-2 BRIEF, INTENSIVE, RESIDENTIAL THERAPY FOR FAMILIES

Purpose: To study a group of families of schizophrenic children who have been in residential treatment at Clear Water Ranch to learn why the children cannot live at home, and how the families function.
Subjects: Families (parents and siblings) and children in residence will be selected according to following criteria: (1) child in residence be verbal and diagnosed schizophrenic or autistic; (2) parents have been participants in the parent therapy groups conducted by Clear Water Ranch Children's House; and (3) parents want the child to return home.
Methods: Families will live at the residential treatment center for a two-week vacation and will participate in family therapy, parent therapy groups, joint meetings with counseling staff and therapists, and the usual work and recreation activities that are part of the Ranch setting. Trained therapists will conduct family therapy, parent therapy, and also act as trained observers. Outside observers will also be utilized. Tests will be used to study family interaction. All therapy sessions will be tape recorded and evaluated.
Duration: September 1964-September 1965.
Investigator(s): Leanore Mesches, M.A., Consulting Psychologist, and Benjamin G. Lewis, Ph.D., Clear Water Ranch Children's House, Inc., 604 College Ave., Santa Rosa, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication is planned in three to four years.

19-LJ-3 FAMILY DIAGNOSIS: MMPI AND CTP RESULTS

Purpose: To assess degree of psychopathology in family members of referred patients.
Subjects: 230 intact families seen at Northland Mental Health Center, Inc.
Methods: Statistical analysis of personality test data.
Findings: The referred patient is basically an emissary from a troubled family. There is a small but significant correlation in the level of pathology between parents of troubled families.
Duration: 1960-1965.
Investigator(s): Richard G. Stennett, Ph.D., Clinical Psychologist, Northland Mental Health Center, Inc., Grand Rapids, Minn.
Publication: Submitted for publication to the *Journal of Clinical Psychology*.

19-LJ-4 THE EMBROILED FAMILY: AN ETIOLOGICAL STUDY OF SCHIZOPHRENIA DEVELOPMENT IN A FAMILY TYPE OF DESCRIBED RELATIONSHIPS AND QUALITIES

Purpose: To describe a variety of family in which schizophrenia frequently occurs; and to formulate etiological hypotheses consistent with this occurrence.
Methods: Analysis of interview and historical record material of families seen as part of the Family Studies Program, correlated with previous diagnostic, history-getting, and therapeutic experience of the investigator.
Findings: In an embroiled family, the child who responds to high parental demands for strength and closeness, without feeling his parents genuinely close or his own strength great enough for the task, may eventually become schizophrenic.
Duration: Not reported-1965.
Investigator(s): Carol F. Hoover, M.S.S.W., Social Service Department, Clinical Research Center, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

19-LJ-5 PERCEPTION OF ROLES, CLOSENESS PATTERNS, AND CAPACITIES BY MEMBERS OF FAMILIES IN NORMAL AND OTHER CATEGORIES

Purpose: To evaluate: (1) possible differences in acknowledged roles, closeness, and expectations of one another, in normal families as compared to families containing at least one neurotic or schizophrenic member; (2) any variation between families of these diagnostic categories in the degree of explicit awareness or ability to present clearly the different perceptions; (3) comparative impressions by the investigator of unacknowledged social relationships and mutual expectations within families of these types based on clinical observation and history material; and (4) degree of sibling variation in functioning within families of the different categories.
